manufactured the friction drive to which you refer failed, but we are unable to say whether their failure was due to faults of the drive or to poor business management. The reason the friction drive is not more used at present is that manufacturers have been increasing the power of their cars from year to year, and there are now very few models of less than 20 horse power, 30-35 horse power being very common powers. But to transmit such large powers requires a very large friction mechanism which it is difficult to find room for on a vehicle without making it look clumsy. The chief advantage of the friction drive is its great simplicity, and another important advantage is that it gives continuous gradations of speed, instead of simply three or four steps. The weakest point of this form of drive is undoubtedly that it is not positive, and a minor disadvantage (minor at least when small cars only are considered) is its bulkiness.-Ep.]

#### Oil for Multiple Disc Clutch.

Editor Horseless Age:

I would be much obliged if you would kindly advise me the best kind of oil to use in a multiple disc clutch that is used on a four cylinder automobile. I would like to know the best kind to cause the clutch to take hold gently and not suddenly, and hold when it does take hold.

D. L. BAUGHMAN.

[A machine oil of medium body is generally recommended. Disc clutches vary greatly in this respect, however, some being even made to operate entirely without lubrication, and you should preferably inquire of the maker of your car what grade of lubricant he recommends and how much should be used.—Ep.]

#### Battery Charging Dynamos.

Editor Horseless Age:

As a subscriber of your paper I take the liberty of asking you to advise me if possible where I can best buy a small dynamo suitable to supply current sufficient to light five lights on my touring car. I am now using such lights, but they use up storage battery too quickly.

GEO. B. LINNARD.

[Such dynamos are manufactured by the Apple Electric Company, Dayton, Ohio, and the Dayton Electric Manufacturing Company.—Ep.]

#### Manufacturers of Farm Tractors. Editor Horseless Age:

Will you kindly give me the address of some firm, if there are any, which makes automobiles or motor trucks suitable for farm purposes? I am taking a course in automobile operation at the Y. M. C. A. Institute, with a view to using one on a farm.

Geo, W. Dower,

[Following is a list of manufacturers of motor wagons and farm tractors operated by gasoline motors: The Avery Company. Peoria, Ill.; the Gas Tractor Company, Minneapolis, Minn.; the Transit Thresher Company, Minneapolis, Minn.; Hart-Parr Company, Charles City, Ia.—Ep.]

#### Tire Sizes.

Editor Horseless Age:

What size tires would you recommend for a six cylinder Stevens-Duryea car? I read your report of the show and was much interested in same. C. A. Hudson.

[The standard equipment of the Stevens-Duryea 1909 models is 34x4 inch all around on the Light Six, and 36x4 inch front and 36x5 inch rear on the Large Six 40 horse power. So far as we know these sizes are the best for these cars.—Ep.]

# Muffling Rotary Cylinder Motors. Editor Horseless Age:

In your issue of November 10. I notice an article on rotary motors. Will you inform me how these rotary engines are muffled, or does the rotary action of the motor serve to reduce the sound sufficiently and thus obviate the need of a muffler?

H. M.

[These motors are usually made without muffler, exhausting into the atmosphere directly when used on an aeroplane, and into the more or less closed space in which the motor is located when used on a car.—Ep.]

# Races on the New Atlanta Speedway.

Tuesday of last week marked the formal opening of the new motor speedway at Hopeville, Ga. The fine weather served to bring thousands of spectators to the track, who almost filled the large grand stands. Most of them arrived early and awaited with keen anticipation the opening pistol shot. The grand stands are ideally located, both as to the view they give and the safety they afford, which latter lent assurance to the crowd. As a further precaution against accident no one was allowed near or on the track. The stretch where the stands are located is through a cut with 12 foot banks on both sides. The stands are located on the outside of the track, and directly opposite on the inside are the timers' and judges' stand and the press stand. The stands being at the top of this almost perpendicular bank makes it impossible for a car to break through into the spectators. At the eastern end of the covered stand the Capital City Club have erected a covered stand for the use of members and friends, with a seating capacity of 450. At this meet an automatic time recorder invented by C. H. Warner, of the Warner Instrument Company, Beloit, Wis., was used for the first time.

The opening event consisted of time trials with plate prizes for first and second places. There were five entries, as follows: Lewis Strang, in his 200 horse power Fiat; Barney Oldfield, in his 150 horse power Benz; John M. Rutherford, in a 30-60 horse power Stearns; T. Cliquot, in a 90 horse power Pope-Toledo, and Walter Christie, in a 150 horse power Christie.

Christie broke a valve head and made the trial on three cylinders, and Cliquot did not finish his starting circuit owing to ignition troubles. Strang was first to make the trial and drove furiously, setting a new American track record of 37.70s., beating the world's record held by Oldfield by 5.3s. John Aitken, 40 horse power National, and Tom Kincaid, 40 horse power National. In this event Strang was slow to get away. Aitken and Kincaid in their Nationals were leading and about on even terms. The

STRANG IN 175 H. P. FLAT, AFTER ESTABLISHING NEW SPEED RECORD.

Oldfield also lowered his own record by 2.97s.

The final results of this event were:

First—Strang, Fiat, 37.71 seconds. Second—Oldfield, Benz, 40.13 seconds. Third—Christie, Christie, 43.82 seconds. Fourth—Rutherford, Stearns, 50.85 seconds.

In the second event, 10 miles for stock chasses of 451 to 600 cubic inches, with two prizes, both cups, there were six starters, as follows: Basle, 30-45 horse power Renault; Harding, 50 horse power Apperson Jack Rabbit; Strang, 60 horse power Fiat; Rutherford, 30-60 horse power Stearns;

National team drove a fast, hard race and were never once in danger. Strang quit on his second lap, owing to motor troubles. The two Nationals kept within a length of each other until near the fourth lap, when Aitken gradually drew away from Kincaid, while both cars were increasing their lead over Harding in the Jack Rabbit. At the finish Aitken led Kincaid by about 100 feet, and the Jack Rabbit by about a half mile.

In the third event, to miles for stock chasses of 161 to 230 cubic inches cylinder capacity, the contestants were: Jas. H. Rodger, 20 horse power White gasoline; Louis Scroitzer, 22.5 horse power Fuller: William Knipper, Chalmers-Detroit; Joe Matson, Chalmers-Detroit, and Joe Nelson 18 horse power Buick. Matson got away first, closely followed by Nelson in the Buick On the first lap Nelson had about one length lead over Matson, but at the finish of the second lap the Buick and the two Chalmers were bunched, with not over 20 feet between the first and third car. On the third lap Nelson in the Buick and Matson in the Chalmers were exactly abreast of each other, running a bonnet to bonnet race. Rolgers in the White gasoline was running a half mile back of the three leaders, with De Fuller a mile in the rear. On the fourth lap Matson was leading his team mate Knip per by only 20 feet, and Nelson by about 50 feet. At the finish of the fifth and last lap Matson crossed the wire first, closely followed by Knipper, with the Buick stiff 30 feet behind. The White gasoline for ished fourth and the Fuller last.

Of the eighteen entrants in the footh

THE PITS OPPOSITE THE GRAND STAND.

event, which was a free for all handicap, with first prize of \$150 and a second prize of \$50, only eight started. The starters and their handicaps were:

Harroun, Marmon, 70 seconds. Stillman, Marmon, 60 seconds. Disbrow, Rainier, 55 seconds. Cliquot, Renault, 45 seconds. Basic, Renault, 35 seconds. Kincaid, National, 25 seconds. Aitken, 60 b. p. National, scratch. Oldfield, 60 h. p. Knox, scratch.

Oldfield did not finish the first lap, his motor going wrong on the back stretch. The two Marmons seemed to be holding their own, while Basle in the Renault was gradually pulling away from Cliquot, also in a Renault; but the dashing driving of John Aitken in the 60 horse power National enabled him to pass one after another of the other drivers and establish a new world's record of 8m. 2.41s., breaking the record of the entrant) and \$600 in gold; the second prize \$300 in gold, and the third prize \$150 in gold. The starters were: Basle, 35-45 Renault; Lorimer, 40 Chalmers; Dingley, 40 Chalmers; Stillman, 35 Marmon; Chevrolet, 30 Buick; Cliquot, 35-45 Renault; Aitken, 40 National, and Kincaid, 40 National.

Chevrolet in his Buick early forged to the front and set the pace. In the seventh mile the National driven by Kincaid stopped, owing to trouble with the steering gear, and was out for seven laps. On the fourteenth mile the other National, driven by Aitken, withdrew definitely from the race. At the twentieth lap the race seemed to lie between the two Chalmers-Detroits and Chevrolet's Buick. In the forty-fifth mile Chevrolet overtook the Chalmers driven by Lorimer, and gained his first lap on this car since the race began. At the end of the fiftieth mile Chevrolet led his nearest

stretch. The crowds were now wild with excitement. World's records went to smash with the completion of the first 100 miles, Chevrolet covering the distance in th. 24m. 8.71s. The former record, held by Aitken in a National and at the Indianapolis Speedway, was 1h. 31m. 41.9s. At the 160th mile Lorimer was forced to stop for a few minutes for repairs. As he finished his 172d mile Dingley was forced to stop and change one of his rear tires. After 150 miles Kincaid was forced to retire because of engine trouble. In the 168th mile the Marmon car, driven by Stillman, which had up to that time been "neck to neck" with the two leaders, blew out a tire on the back stretch, and immediately all four wheels collapsed and the car skidded right side up like a stone boat off to the inside edge of the track. Stillman and his mechanic, Dawson, were thrown out, but neither suffered injury. The order of finish and the times were as follows:

- 1. Chevrolet, Buick, 2:46:48.47.
- Dingley, Chalmers, 2:53:33.91. Lorimer, Chalmers, 2:55:15.61.

#### Second Day's Races.

The attendance the second day was good, the crowd all but filling the bleachers and the grand stand being about three-quarters full. All of the races started promptly and there was none of the delay between events so common in connection with track races. The first event, which started at about II o'clock, was the 20 miles motorcycle race for professionals. While the time in this event was not as fast as in the events for larger cars, considering that none of the motors were over 7 horse power, it was very creditable, and considering that the machines were much more nearly matched than in most car events the race was quite interesting as a test of the driver's skill in handling the machine. The event brought out five starters. R. W. Gayle, Joyce and R. Stubbs rode 7 horse power Indians; Russell Walthour rode a 7 horse power Merkel, and V. Moss a 7 horse power R-S.

At the start Stubbs jumped into the lead and rapidly distanced the field, but in the fourteenth mile he unfortunately broke an exhaust valve and was obliged to retire. Then began a good race between the others for first place, Walthour finally winning, his time for the 20 miles being 20m. 16s.; second, Joyce, 20m. 27s.; third, V. Moss, 20m.

The second event was the 10 mile stock

AITERN AND KINCAID IN NATIONALS.

established by Oldfield in a Benz at Indianapolis by 13.49s. The event was won, however, by Stillman (Marmon), whose time was 8m. 54.96s., and Harroun, in the other Marmon, secured second place.

The fifth event was a 2 mile free for all. The starters were Strang, Fiat; Oldfield, Benz; Christie, Christie, and Aitken, National. Strang fairly ran away from the rest and won in 1m. 31.63s. Oldfield was second in 1m. 37.18s.; Aitken third in 1m. 43.72s., and Christie fourth in 1m. 51.4s.

The sixth event was a 200 mile race for stock chasses of 301-450 cubic inches displacement, the first prize being the Coca Cola Trophy (valued at \$5,000, which must be won three times to become the property competitor by nearly 2 miles, Dingley, of the Chalmers team, was second, and Lorimer in the other Chalmers third. At the sixty-ninth mile Chevrolet finally succeeded in gaining a lap on Dingley. The Buick passed its rival in front of the grand stand, and the spectators stood and cheered lustily.

As Chevrolet passed the grand stand in the seventy-third mile it was seen that his car was on fire. Smoke was pouring from the hood and it seemed he must quit. He did stop on the back stretch to extinguish the fire, and this delay cost him the lead he had on the two Chalmers cars, as they caught up with and passed him. In the seventy-fifth mile Chevrolet caught up with Dingley again and passed him on the back

START OF 200 MILE RACE (WEDNESDAY).

chassis race for cars from 451 to 600 cubic inches. This brought out four starters, viz., two 60 horse power Fiats, driven by Strang and Robertson; a 60 horse power Stearns, driven by Marquis, and the Apperson Jack Rabbit, driven by Harding. At the start Strang jumped into the lead and at the end of the first two mile lap he had a lead of about one-eighth of a mile. The Apperson was second, with the Fiat and Stearns in close pursuit. At the end of the third lap Strang was stopped by engine trouble and the Apperson took the lead. At the end of the fourth lap Robertson and his Fiat also withdrew. This left only the Apperson and the Stearns in this race. The Apperson finished first in 8m. 30.68s. The Stearns came in second.

The next event was one of the prettiest races of the day, being a 10 mile amateur free for all, the contestants being local men, and considerable enthusiasm was shown among the spectators. The entrants were Oldknow on a 30 horse power Buick. Calvin Travis on a "40" Chalmers and J. M. Rutherford on a Stearns.

The feature of the race was the battle royal between Travis and Oldknow. Almost all the way to the finish Travis led, but a blanket could have covered the two machines. Turning into the stretch Travis was leading by at least 20 yards, but Oldknow made one of the most spectacular sprints so far seen on the track and managed to beat Travis at the tape by not more than the front spring's length.

The 4 mile free for all brought out some of the most powerful cars on the track. Strang's 175 horse power Fiat, Christie's front drive 130 horse power, Aitken's 60 horse power National, Robertson's 60 horse power Fiat and Disbrow's 50 horse power Rainier. Strang, as usual, led the field at the end of the first lap. Robertson withdrew. The Rainier, on account of its smaller power, was hopelessly outclassed, but kept at it. Strang was never headed and finished first in 2m. 47.038. Christie was second in 3m. 7.63s., and Aitken a close third. Christie, whose car has only two gears, was at a disadvantage in not being able to get away as quickly as some of the others.

The star event of the day was the three cornered match race between Oldfield. Strang and Christie, the former on the 120 horse power Benz, Strang on his big Fiat and Christie on his front driven machine. After two false starts-the start in this event being a flying one-they finally got away with Strang in the lead and Oldfield a close second. Strang gradually increased his lead on Oldfield, and Christie, who had made a rather poor start, was gradually closing up the gap. At the end of the sixth mile Christie seemed to be in trouble and lost ground. Strang won in 7m. 1.94s., and Oldfield came in second, his time being 7 m. 27.71s.

The next event was the 100 mile stock chassis race for machines of from 161 to 230 cubic inches piston displacement. This

brought out six starters, viz., the two Chalmers, driven by Matson and Knipper; the Buick, driven by Nelson, and two E-M-F's, driven by Jones and Yeager. At the start the two Chalmers jumped into the lead, followed closely by the Buick, the others following in the rear. At the eighth mile the Buick passed Matson's Chalmers, but Knipper still maintained a good lead. Shortly after this Matson stopped for some repairs and then went on again. At the end of the fourteenth mile Knipper stopped to take on supplies when he had a lead of about a mile on the Buick. Matson's stop for repairs put him back to last position, but nothing daunted he restarted and kept steadily at it. This steady work soon told, and he gradually picked up car after car until he was in third position, Nelson on his Buick being now in the lead, with Knipper pressing him closely. This order conhorse power Marmon; L. Basle, 20 horse power Renault, and Joe Matson, 30 horse power Chalmers. The race was won by Harroun in the Marmon in th. 49m. 2648. Harroun did not stop his car during the entire race. Matson in a Chalmers was 6 miles behind the Marmon, while Basle in the Renault and Chevrolet in the Buick were 18 miles behind the winner. The Buick stopped five times with engine trouble and once caught fire. The Chalmers did not stop in the race, and finished second in th. 57m. 22.92s, The Renault finished third in 2h. 9m. 15s.; Buick last, time, 2h. 9m. 30.13s.

The 6 mile professional motorcycle race was next on the program, the motor displacement being limited to 60.32 cubic inches (5 horse power). Three cash prizes were offered of \$25, \$15 and \$10 respectively. The entrants comprised three Indians ridden respectively by Stubbs, Joyce and Gall.

CHEVROLET (BUICK), WINNING 200 MILE RACE ON TUESDAY.

tinued till the 90 mile mark was reached, when Nelson discovered that his oil supply was low. This caused him to slow down considerably, and Knipper gradually closed up the gap, and finally passed him on the last lap. Matson had also been keeping at it steadily, and he passed Nelson less than a half a lap from the finish, coming in second. The times were: Knipper, 1h. 40m. 46.82s.; Matson, 1h. 41m. 52.46s.; Nelson, 1h. 43m. 10:42s.

During this race a drizzling rain fell and made the track quite slippery, resulting in considerable skidding, and in one case an accident was narrowly avoided. For this reason the 20 mile handicap was postponed till the next day.

#### Thursday's Races.

Thursday opened with a 120 mile race for stock chasses of 231 to 300 cubic inches. The first prize consisted of the Atlanta Auto Association Trophy and \$600 in gold, the second prize of \$300 in gold and the third prize of \$150 in gold. There were four starters, as follows: Louis Chevrolet, 30 horse power Buick; Harroun, 30

and an Excelsior ridden by R. E. Walthour. Stubbs won in 5m. 18.11s., Walthour coning in second in 5m. 44.44s., and Gail third in 5m. 50.87s.

An interesting diversion was furnished after the motorcycle race by the old Haynes No 1, built in 1893. It came plugging down to the grand stand amid shouts and laughter and sincere applause. The fastest time this Haynes machine ever made was 5 miles in 26 minutes. In order to give the crowd an illustration of the progress of the infantry Lewis Strang brought out his 200 horse power Fiat and ran down the track for a few yards besides the Haynes, and then did an exhibition 2 miles in 1m. 21.51s.

In the 10 mile novice motorcycle rare, notor displacement not to exceed 30.5 mbic inches (4 horse power), for two silver medal prizes, G. W. Sisson won in & 53.58s., on an Excelsior; W. J. Friebuer was second on a Merkel. The other starten were Ray Seymour (Reading-Standard). Harry Klebes (Reading-Standard) and John Fahey (Indian).

While lining up for the 20 mile free for all handicap (first prize \$150, second print

Whalen, in a Matheson, was ruled rack for nearly running down Ed.

enault and Pope-Toledo withdrew fth lap, followed by the two Nahe Pope-Toledo and Fiat. Disbrow ier won in 10m. 51.15s., closely fol-Harroun in a Marmon, who came in 20m. 10.63s., and Stillman, also mon, third, in 20m. 23.41s.

ourth event of the day was the 10 ateur championship race of the stock chasses. Rutherford in a got away first, followed by Travis lmers and Oldknow in a Buick. In lap Oldknow overcame the lead got at the start, and it became a veen Rutherford and Oldknow, but a short time, as Rutherford ran om both the Buick and Chalmers in 8m. 42.63s.; Oldknow finished n 9m. 4.17s., and Travis third in 9m. This was vindication for Rutherford, now had bested him on Wednesday ne-hundredth of a second

ext event was easily the most inand most spectacular of the meet at time, and was for 20 mile stock of 301 to 450 cubic inches piston ment, with two cups as prizes. The were: Disbrow, Rainier 50; Lorialmers 40; Dingley, Chalmers 40; , Marmon 35; Aitken, National 40, caid, National 40.

ow was slow in bringing his car to and was not allowed to start. On lap the five leading cars came down ch with scarce 50 feet between them following order: Aitken, Kincaid, , Dingley, Lorimer. On the finish ext lap they were still together, but had advanced into third place. In rth lap Kincaid quit the race, In enth lap Lorimer in the Chalmers tken in the National crossed the a dead heat. Thus they ran up to th lap, when Aitken drew away e Chalmers and finished about 200 ad of Stillman's Marmon, which was feet ahead of Dingley. Aitken had Oldfield's 20 mile record of 16m.

53.8s., made at Indianapolis, by nearly 11 seconds. The results follow:

- Aitken, National, 16:42.76.
- Stillman, Marmon, 16:46.86.
   Lorimer, Chalmers, 16:49.63.

Event 8 was a 10 mile race for stock chasses of 600 cubic inches or under capacity. There were five entries, as follows: Robertson, Fiat 60; Disbrow, Rainier 50; Harding, Apperson Jack Rabbit 50; Aitken, National 40, and Marquis, Stearns 30-60. Robertson got away first; he had a lead of the field of an eighth of a mile at the end of the first lap, and rapidly increased it to a mile. Aitken and Harding ran a bonnet to bonnet race the entire distance. The Stearns went out of the running and had to be towed off the track. Robertson finished over a mile ahead of Aitken, who in turn finished 50 feet ahead of Harding in the Jack Rabbit. Results:

- 1. Robertson, Fiat, 7:47.71. 2. Aitken, National, 8:22.87.

The ninth event was a 4 mile race for stock chasses of 161 to 230 cubic inch capacity. There were four entries, viz., Knipper, Chalmers 30; Matson, Chalmers 30; Nelson, Buick Model 16-18 horse power, and Yeager, E-M-F. 30. Matson took the lead and maintained it, closely followed by his team mate Knipper until the finish. The Buick finished third and the E-M-F fourth.

Matson, Chalmers, 4:05.52. Knipper, Chalmers, 4:08.42.

The last event of the day was a 10 mile free for all handicap, in which two cash prizes of \$150 and \$50 were offered. Robertson in a Fiat 60 was scratch man, while Disbrow in the Rainier and Harroun in a Marmon 32 had 55 seconds, Harding in a Jack Rabbit 50 seconds, Stillman in a Marmon 35 seconds and Aitken in a National 40 had 32 seconds handicap. Robertson made up his handicap and passed every car on the track in the fourth lap and finished half a mile ahead of the field after a very pretty driving exhibition. Results:

- r. Robertson, Fiat, 8:39.8. 2. Aitken, National, 8:50.25.
- Stillman, Marmon, 8:50.53.

#### Friday's Races.

Friday opened with what might have been a serious accident. During the pre-liminary tryouts before the races began the Pope-Toledo "oo" driven by H. I. Kilpatrick, with R. Church as mechanician, blew off two cylinders, caught on fire and turned over on its side, throwing Kilpatrick 150 feet over the bank into a bed of pine shrubs, while Church went rolling down the track. Neither of the men was injured seriously.

The first event of the day was a 10 mile motorcycle race for amateur trade drivers. Teubner on a Merkel got away first, but Klebes on a Reading-Standard took the lead on the first lap and lapped Fahey on an Indian in the third. Fahey quit in the fourth, leaving the contest to the other three riders. The results were:

- 1. Klebes, Reading-Standard, 8:47.17.
- Teubner, Merkel, 8:53.17. Seymour, Reading-Standard, 8:53.77.

Next came the all-professional motorcycle contest for 10 miles. There were five starters as follows: Stubbs, Indian; Joyce, Indian: Gail, Indian: Walthour, Merkel, and Moss, Reading-Standard. At the start they were well bunched, with Gail slightly in the lead. Walthour, however, took the lead in the second lap and led Stubbs, the next closest man, by half a mile at the finish. Result:

- 1. Walthour, Merkel, 8:36.60.
- z. Stubbs, Indian, 8:55.40. 3. Gail, Indian, 10:22.60.

The third number on the program was a 24 mile race for stock chasses of 161 to 230 cubic inches. There were but two entries, both Chalmers-Detroits, driven by Knipper and Matson, respectively. This was a seesaw affair, which was finally won by Knipper in 23m. 40.43s., Matson's time being 23m. 40.77s.

The fourth event was a 20 mile handicap, restricted to contestants in the New York Herald-Atlanta Journal-Constitution tour. There were but three starters, viz.: Whalen, Matheson; Shaab, Renault, and Stoecker, Benz. The honors went to Stoecker, who made the distance in 20m.

KNIPPER (CHALMERS) WINNING 100 MILE RACE (WEDNESDAY).

RAY W. HARROUN (MARMON), WINNER OF THE 120 MILE RACE, NOVEMBER 11.

36.86s. Whalen was second in 21m. 15.64s. and Shaab third in 21m. 55.83s. Stoecker was scratch man, Shaab had 30 seconds, and Whalen 55 seconds handicap.

Next came a 12 mile race for stock chasses of 301 to 450 cubic inches. Aitken in a National led in the first lap, with Stillman in a Marmon 50 feet behind a close second. The Marmon, however, went out in the third lap, leaving the contest to Aitken, Dingley on a Chalmers, Lorimer in a Chalmers, and Disbrow in the Rainier. For the last three laps the National and two Chalmerses were less than 50 feet apart and Disbrow far behind. Results:

- t. Aitken, National, 10:07.65. 2. Lorimer, Chalmers-Detroit, 10:09.28.
- 3. Dingley, Chalmers, 10:10.13.

The sixth event proved to be a 10 mile stock chassis handicap battle, limited to cars of 231 to 300 cubic inches capacity, between Ray Harroun (Marmon), Knipper (Chalmers) and Matson (Chalmers), for two prizes, both cups, the Chalmerses having 15 seconds handicap over the Marmon. By the third lap the Marmon had overcome the lead of the Chalmerses and worked into first place, which position it maintained to the finish, gaining a lead of 50 feet over Matson, its nearest competitor, all three driving furiously. Results:

- Marmon, Harroun, 9:51.01.
- 2. Chalmers, Matson, 9:51.23. 3. Chalmers, Knipper, 9:51.27.

The seventh event was to have been a 2 mile free for all, best two out of three heats, but after the first heat, by unanimous consent of the drivers, it was decided not to run the other heats. Strang in his 200 horse power Fiat got away first with about 50 feet lead, while Christie got away last, but managed to overtake Robertson in the Fiat 60 on the back stretch. Results:

- Strang, Fiat, 1:34-47.
- Christic, Christic, 1:41.70. Robertson, Fiat, 1:42.30.
- The eighth event was a 6 mile race for

stock chasses of 451 to 600 cubic inches. Robertson drove the Fiat 60, Disbrow the Rainier 50, Harding the Apperson Jack Rabbit 50 and Aitken the National 40. Robertson got away first but was closely pressed by the other three cars. On the first lap Robertson led the field by half a mile, with the National, Rainier and Jack Rabbit running in a bunch in the order named. At the finish of the second lap Robertson led by at least a mile, which lead he held to the finish. Results:

- 1. Robertson, Fiat, 4:43.37.
- Aitken, National, 5:11-17.
- Harding, Apperson, 5:13.02.

Next came a 24 mile stock chassis race, open only to amateur drivers, with the Kriegshaber Trophy as the prize, and contended for by Travis in a Chalmers, Oldknow in a Buick, Rutherford in a Stearns, and Kiser in a Pope-Hartford.

The Buick went out in the second lap, and the Chalmers out on the back stretch of the fifth lap, leaving only the Stearns and Pope-Hartford in the race. On the eighth lap Rutherford in his Stearns lapped Kiser in the Pope-Hartford, and finished three miles and a half ahead on the final round. Results:

- 1. Rutherford, Stearns, 20:35.25.
- Kiser, Pope-Hartford, 23:44.53.

There were eight starters in the 50 mile free for all, the next event, and of these two, Harding in the Apperson Jack Rabbit and Lorimer in a Chalmers-Detroit, were destined not to finish through serious accident, though no one was injured. On the thirteenth lap the Jack Rabbit blew a tire, skidded and collided with the Chalmers, putting both cars out of the running, breaking one front wheel of the Blue Bird and disabling the Jack Rabbit. In this race Robertson, in a Fiat, broke, by more than 4 minutes, the record established by Aitken in a National, at Indianapolis, for 50 miles. Results:

- Robertson, Fiat 60, 40:14.02.
- Aitken, National 40, 43:11.41.
- Stillman, Marmon 35, 43:30.56.

Saturday's Races.

Saturday opened with a four mile amateur motorcycle race, in which there were three starters, viz., Seymour, Fahey and Klebes, all on Reading-Standards. Fahey was unable to get started and Klebes won in 3m. 22.19s. This event was to have been followed by a race for professionals, but the starter ruled the race off.

Then followed a 10 mile event for stock chassis of 161 to 230 cubic inches. There were but two starters in this, both Chalmers, driven by Knipper and Matson. Matson had to stop on the first mile with motor trouble and never got closer than 11/2 miles to Knipper again, who won in 10m. 41.06s., Matson finishing in 13m. 35.73s.

Strang then gave a 2 mile exhibition with a flying start, going the circuit in Im. 22.078.

The fourth event was a 10 mile handicap, in which started Arthur Chevrolet, Buick 30; Ray Harroun, Marmon 32; Matson, Chalmers 30, and Knipper, Chalmers 30. The two Chalmers had 30 seconds over the Buick and Marmon, these two being scratch men. Chevrolet drove a fast race from the beginning, and lapped the others in front of the grand stand in the third lap. In the eighth mile the Buick was leading a lap, while the Marmon had about overcome the handicap of the Chalmers cars, and finished in second place a wheel diameter ahead of Knipper's car, which was third. Results:

- 1. Chevrolet, Buick, 9:03.18. 2. Harroun, Marmon, 9:18.07.
- 3. Knipper, Chalmers, 9:18.09.

The fifth event was an 8 mile free for all handicap. There were five starters, viz., a Matheson, with Whalen driving, 1:40 handicap; Rainier, Disbrow, 1:10; National, Kincaid, I minute; National, Aitken, # seconds handicap, and Fiat 60, Robertson, scratch. In the second lap Kincaid's National lost a wheel. The Matheson pulled into the paddock at the finish of the third. Aitken in the National won by 9 seconds. Results:

- 1. Aitken, National, 7:42.73
- Disbrow, Rainier, 7:48.63.
- Robertson, Fiat, 7:59.50.

The sixth event was a 12 mile race for stock chasses 301 to 450 cubic inches, with four entries, as follows: Rainier, Disbrow; two Chalmerses driven by Lorimer and Dingley, and a Buick, driven by Louis Chevrolet. The Buick and both Chalmerses got away in a bunch, and on the finish of the first lap there was scarcely 100 feet between the first three cars. At the fmish Chevrolet led Dingley by 200 yards, Lorimet by 300 yards and Disbrow by 450 yards Results:

- Chevrolet, Buick, 10:12.66. Dingley, Chalmers, 10:28.83. Lorimer, Chalmers, 10:37.76.

The 6 mile stock chassis handicap, 231 16 300 cubic inches, had four entries and had the appearance of a fast contest. Knipper and Matson in Chalmers-Detroits and In seconds handicap, and Harroun was in hite 5 seconds over Arthur Chevrolet in Buick, but Chevrolet disqualified by ing before the signal. The Marmon allo a very pretty exhibition of driving by Harroun, made up the advantage of the Oul mers' handicap and finished first Re-

- 1. Harroun, Marmon, 05:40,83.
  2. Knipper, Chalmers, 05:42.
  3. Matson, Chalmers, 05:50.52.
- The last event of the several days' me cessful racing was a 200 mile race for stock chasses of 451 to 600 cubic inches

cylinder capacity. The first prize in

event was the City of Atlanta ny, valued at \$10,000 (which must won three times to become the rty of the entrant), and \$1,000 in gold, second prize was \$500 in gold; third \$300 in gold; fourth prize, \$200 in

ere were eleven entries, some of which been in nearly every contest during reek, and surely showed their mettle gain entering this grueling grind. were: Robertson, Fiat 60; Charles Renault 35-45; Disbrow, Rainier Lorimer, Chalmers 40; Hard-Apperson Jack Rabbit 50; Ding-Chalmers 40; Stillman, Marmon Louis Strang, Fiat 60; Chevrolet, 30; Harroun, Marmon 32, and L. Renault 35-45.

first 40 miles were covered in record by Robertson, Chevrolet and Strang. whom had lapped the other cars in ace at the completion of the fortymile. At the end of the fiftieth the four leaders were Robertson, olet, Strang and Disbrow. Roberttime for the first quarter of the race, 41:02.98, was far ahead of the d established by Oldfield at Indianwhich was 44:31.2. In the sixmile Lorimer, driving a Chalmers, ed out with axle trouble. In the sevighth mile Chevrolet had to stop on ack stretch for motor adjustment, but back in time to maintain his position cond.

cars were traveling at such a rate eed, and so bunched, that it was alimpossible to keep tab on any but eaders. At the end of the eightymile Chevrolet was forced to take uick out of the race, on account of nission trouble. At the one hundredth mark the order of running was Rob-, Strang, Disbrow, Stillman. Just completing his one hundred and ieth mile Strang blew a tire, stopped pits and changed the tire in less

RAINIER (DISBROW), WINNER OF ATLANTA TROPHY.

than a minute. At the end of the one hundred and twenty-second mile the Apperson Jack Rabbit, then in fourth position, was forced into the paddock with a broken spring. Strang continued to have tire trouble and went to the paddocks in the one hundred and twenty-sixth mile. At the end of his one hundred and sixty-second mile Robertson stopped for the first time. His car came to a standstill on the turn into the home stretch on account of a broken chain. As the Fiat was being repaired the Rainier, driven by Disbrow, shot into first place. Robertson finally completed his repairs and re-entered the race 8 miles behind Disbrow, but finished less than two laps behind. Results:

- 1. Disbrow, Rainier, 2:53:48.32.
- Robertson, Fiat, 2:57:47.05. C. Basle, Renault, 2:58:43:93.
- L. Basle, Renault, 3:13:41:87.
- Summary of the Week's Events.

The results of the Atlanta speed meet show several remarkable things. One is a record showing the winnings of the many makes of cars. Nearly every make entered figured "inside the money" during some oneor other of the races. The absence of any serious accidents was in itself remarkable, since every event was a fast one in which records were broken or equaled.

The manner in which the different events were handled, there being no unnecessary delay between them, was also a notable feature. There was only a minimum of tire trouble, though several of the cars seemed to be on the track continually. Notable among those who were constantly on the fly were the two Marmons, the two Chalmerses and the Rainier. Michelin tires were used on the winning cars in every event except the two amateur events. Rutherford, driving the Stearns and winning two events, used Fisk rims and bolted on tires. The following summary will convey some idea as to how the glory and the money were divided:

Fiat-9 firsts, 1 second, 2 thirds. Chalmers-Detroit-5 firsts, 11 seconds, 7 thirds. National-4 firsts, 5 seconds, 3 thirds. Marmon-4 firsts, 4 seconds, 3 thirds. Buick-4 firsts, 1 second, 2 thirds. Stearns-2 firsts, 2 seconds. Rainier-2 firsts, 1 second. Apperson-2 firsts, 3 seconds, 3 thirds. Benz-1 first, 3 seconds. Christie—2 seconds, r third. Matheson—r second. Pope-Hartford-2 seconds. Renault-3 thirds.

The various drivers who competed in the races signed a statement in which they highly praised the Atlanta Speedway, stating that the surface is all that could be asked, and that after the very hard test it had received during the week it was still in perfect condition. They also acknowledge the cordial treatment given them at Atlanta

### Portland (Ore.) Show Plans.

Plans for the annual automobile shows were discussed at a joint meeting of the Portland Automobile Club and the Dealers' Association held at the Commercial Club November 4. It was decided to hold the show during the last week in January. It is probable the Armory building will be selected for the exhibits, as on former occasions, providing suitable space can be allotted. If that cannot be done, a plan to hold the show on the ground floor of one of the new downtown skyscrapers now under construction will be considered. A show committee is to be appointed to take the arrangements for the show in hand.

STILLMAN (MARMON), WINNER OF SEVERAL EVENTS.

# The Los Angeles to Phoenix Race.

The last starter in the race from Los Angeles, Cal., to Phœnix, Ariz., a two cylinder, 20 horse power Ford, arrived at the finish three days and a half after the beginning of the race, after encountering and overcoming a multitude of accidents and mishaps. Of the ten cars that lined up at the starting line in Los Angeles at 10 p. m. on Saturday, November 6, not one came through without an accident or break, more or less severe, on the scarcely discernible desert trail by courtesy called road, but despite the damages sustained eight of the cars reached Phœnix and participated in the track races at the Territorial Fair. Though the roads were in no better condition than during the first race over the same stretch last year, the winning car, the Buick, driven by two brothers, J. and L. Nikrent, managed to reduce the running time from 30h. 25m. 33s. to 19h. 13m. 3s., a gain of 11h, 121/2m, over the record established by F. C. Fenner in a White steamer last year.

The condition of the roads over which the race was run can hardly be exaggerated. The first 109 of the 419 miles between Los Angeles and Whitewater do not .present great difficulties and make possible fair speed. Between Whitewater and Palm Springs in the desert washes and deep silt begin to make themselves felt, though the real fight with the desert trail does not begin until Indio is passed, where the trail leaves the railroad to strike off into the waste of the Colorado desert. For 94 miles the parallel ruts of the trail lead through silt as fine as flour in its texture, through gullies with almost sheer sides, across the dry beds of streams strewn with bowlders, over steep rocky or sandy grades, with puffs of alkali dust rising continually in front of the cars and blinding the drivers in the glaring desert sun. At one place the sand is so deep, the silt so tenacious that on a down grade not only has full power to be applied, but the mechanic has to get out and push. Not a human habitation is to be found along this entire stretch of almost 100 miles. Water is to be had in only two places-at Dos Palmos and Chuckawallawhere the checkers kept lonely vigil waiting for the racers. Bucking the fine silt on the low gear availed the racers not at all. By experience they learned that such a proceeding would only make the spinning wheels dig deeper and deeper into the silt, until in one case an inexperienced tourist endeavoring to go over the course was discovered by racing crews out on practice after his car had been buried more than 4 feet in the bottomless silt. Only by backing out of the silt that packs in front of the wheels and taking it on the intermediate gear could the drivers extricate themselves out of dozens of spots without recourse to the shovel.

The first stage of the race ended at Ehrenberg, a settlement of a few houses on the banks of the Colorado River, 248 miles from Los Angeles. Officials of the Maricopa A. C. checked the cars in as they arrived on the afternoon of Sunday, November 7, took charge of the cars and checked them out again at fifteen minute intervals beginning at 5:15 Monday morning, in the order of their arrival. During the time spent at the Ehrenberg control, and while being ferried in a scow across the river, no work was allowed on the car, and the taking on of water, gasoline and oil had to be done after the cars were checked out again. From the river to Phœnix the roads improved slightly and the worst of the high centres had been removed a week previous to the race, but at best the roads were a succession of bumps.

Trouble began almost immediately after the starting of the entries between 10 and 12 p. m. Saturday night. Though the Los Angeles police enforced the speed limits, fully 50,000 persons lined the streets, and automobiles had gone far into the country to catch a glimpse of the racers' headlights. In consequence of a false alarm a machine containing four spectators turned out of the road at full speed, struck a pole and hurled the occupants into the ditch, injuring one of them probably fatally. Before the racers had reached San Bernardino, & miles, the accidents began. When an automobile standing at a road intersection three its searchlight rays straight into the face of Rose, the Elmore driver, it blinded him, and in consequence he hit a culvert at full speed. The shock knocked loose every portion of the equipment not riveted to the car. Tools, provisions, spare parts, everything went overboard, but despite the loss the driver continued. The Pennsylvania and the Columbia, following in the wake of the Elmore, hit the wreckage. The Pennsylvania escaped with a sheared pin on a brake rod, losing an hour and a half in repain in San Bernardino. Despite the handicas the Pennsylvania was the third car to reach the Colorado River control, but more trouble at Vicksburg, in Arizona, forced it to drop into sixth place. The Elmore, after a game fight, limped into Phœnix Monday night with a patched transmission, the intermediate gear alone having escaped strip-

The Columbia also struck the wreckies, cracked its frame and stopped-for more than two hours in San Bernardino to patch the crack with a plate and bolts. The weakened frame notwithstanding. Driver Stone nursed his car along and landed in second place, making the run in 23h 35m 20s. The Studebaker E-M-F., driven by Bert Latham, landed in third place, th. 21m. behind the Columbia. To the Colorado River the little car escaped serious trouble but when it finished it had been running 70 miles without water, with the front axk badly bent on the rough roads. The Kisselkar broke a steering knuckle. The driver replaced the broken part after several hours' delay in hunting up the car of the owner, and continued, only to hit a rock between the river and Phoenix. It captured fourth place with a bent front axle and steering rod. The Dorris was put out of

THE WINNING BUICK ON THE EAST BANK OF THE COLORADO RIGHT.

the race when, in a narrow gulch, it hit the only tree, a willow, growing on the desert for many miles. It was disabled and gave up the race. The Franklin injured the housing of the rear axle near Palm Springs and returned to Los Angeles after repairs under its own power. The Ford smashed a wheel at the beginning of the desert trip, wired to Los Angeles for a spare wheel and

gamely kept on,

The fight for first honors between the winner, the Buick, and the Isotta-Fraschini did not end until Phœnix was almost in sight. At Mecca, where the racers left the railroad and struck into the wilderness, the Isotta was thirty-five minutes ahead of the Buick in elapsed time; but the splendid driving of the Nikrena brothers told in the desert run, and at the river the Buick had gained forty minutes over the imported car. On Monday morning the Isotta started east at 5:15. with the Buick following fifteen minutes later. Both cars had escaped accidents so far and both struck a terrific clip over the rough road, regardless of high centres, in an effort to get in first. At Quartzite, 19 miles from the river, the Isotta stopped to change a tire, and the Buick overtook it. Four times the cars changed position. The Buick lost four screws out of the false bottom containing the oil below the crank case, lost 6 gallons of oil and had to stop twice to take on a new supply. It lost the road and ten precious minutes, but the Isotta also had its share of trouble. The imported car broke the feed pipe to the carburetor, and, as a result of striking a high centre, it bent its front axle and had to be towed into Phœnix the last 4 miles, arriving 3h. 23m. after the leader. The judges disqualified the Italian car, and as a result second place went to the Columbia.

As we go to press our Los Angeles correspondent writes as follows:

"After a number of consultations the officials of the Maricopa A. C. decided to award second place to the Isotta, the entry of the Motor Car Import Company, the head of which concern, F. C. Fenner, was the winner of last year's race. The Isotta was towed in the last few miles of the race, but since Rule 7 provides that contestants may use any means except transportation on a railroad to reach the finish line, it was decided that the towing of the disabled car did not disqualify the entry. By the decision the Columbia entry moves from second to third place, the Studebaker E-M-F from third to fourth and the Kisselkar from fourth to fifth place. Fenner did not protest the ruling of the judges when they unofficially disqualified his entry, and the unofficial action was set aside voluntarily.

"The official figures increase the running time of the winner, the Buick, from 19h. 13m. to 19h. 40m."

Entry blanks have been issued for the Fort Lee (N. J.) hill climb to be held Thanksgiving Day.

#### Business Opportunities.

Howard Case & Co., Lethbridge, Alberta, have sold out certain branches of their original business, with the intention of devoting their whole time to the automobile and are prepared to consider district or provincial agencies for medium priced touring cars. They would also like to hear from manufacturers of high wheel motor bug-

#### A. C. of Vermont Annual Meeting.

The A. C. of Vermont met at the Pavilion Hotel in Montpelier, Vt., October 21, for its annual meeting. The election of officers resulted as follows: President, W. W. Brown, of Springfield; first vice president, James M. Boutwell, of Montpelier; second vice president, Dr. J. Holmes Jackson, of Burlington; secretary and treasurer, S. S. Ballard, of Montpelier; director, G. H. Morrill, of St. Johnsbury. The date of holding the annual meeting was changed from the third Thursday in October to the first Saturday in September. A vote of thanks was tendered Hon. C. W. Gates, the State Highway Commissioner, for the efficient manner in which he has conducted improvements upon the highways of the State the past year. The club voted to L. H. Greene the sum of \$50, as compensation for his faithful labors as secretary and treasurer the past year. It was voted to start a campaign for the erection of danger signs and direction signs.

#### Recognized Automobile Clubs to Discuss Racing Question.

The recognized national automobile clubs will hold a joint conference at Paris on December 7, at which time general rules for automobile racing during the season of 1910 will be decided upon. The Automobile Club of America, the recognized club in this country, has been consulting with the Motor Contest Association regarding suggestions to be offered by the club's representative at the Paris conference. It is believed that the club will urge that in future all' international road races be restricted to stock chasses.

#### Three New Member Clubs for A. A. A.

Three new clubs were elected to membership in the A. A. A. at the regular monthly meeting of the executive committee in New York, viz., Atlanta A. A., of Atlanta, Ga.; Waco A. C., Waco, Tex., and the Rowan County A. C., of Salisbury. N. C. At the same time reports were received indicating that work is progressing toward the formation of State associations in Texas, North Carolina, Alabama and Florida. Ralph W. Smith, president of the Denver, M. C. and the Colorado State A. A., was named a member of the A. A. A. executive committee.

#### Speed Trials on Indianapolis Speedwav.

About one-half of the brick roadway of the Indianapolis Motor Speedway has been completed, and it is expected the remainder will be finished early next month. E. A. Moross, director of contests of the speedway, while attending the Atlanta race meet announced that on December 11 an attempt would be made to break all world's records from 1 mile to 1,000 miles by such drivers as Strang, Oldfield, Christie and others.

#### Coming Events.

November 6-17-San Antonio, Tex., Race Meet,

San Antonio A. C.
November 14-17—San Antonio, Tex., Four Day
Track Race, San Antonio A. C.
November 20-21—New Orleans, La., Two Day

Track Race, New Orleans A. C.

November 22-Flag-to-Flag Reliability Run, from

Denver to City of Mexico.

November 25—Redlands, Cal., Hill Climb, Mile Hill Climb Association.

December 12-San Antonio, Tex., Annual En-durance Contest, San Antonio A. C.

December 25 to January 1-Columbus, Ohio, Automobile Show, Auditorium.

December 29-30-Philadelphia (Pa.) Annual Midwinter Endurance Contest, Quaker City M. C.

December 31 to January 7-New York City Annual Show, Grand Central Palace, American Motor Car Manufacturers' Association.

January 8-15-New York Annual Show, Madison Square Garden, Association of Licensed Automo-

bile Manufacturers,
January 10-16—Portland, Ore., Annual Automobile Show.

January 15-29—Philadelphia, Pa., Automobile Show, Second Regiment Armory.

January 24-29-Detroit, Mich., Automobile Show,

Wayne Hotel Gardens. February 4-6-New Orleans, La., Annual Mardi Gras Speed Carnival, New Orleans A. C.

February 5-12—The Ninth Annual National Show at Chicago, Ill.

February 14-19—Buffalo, N. Y., Automobile Show, Broadway Arsenal, A. C. of Buffalo.

February 14-21-St. Louis, Mo., Annual Auto-

mobile Show, National Guard Armory.
February 19-26—Newark, N. J., Automobile Show, Essex Troop Armory. February 19-26-Salt Lake City, Utah, Automo-

bile Show, Auditorium.

February 21-26—Binghamton, N. Y., Automobile Show, State Armory.
February 22-26—Kansas City, Mo., Fourth An-

nual Show, Convention Hall, Kansas City Automobile Dealers' Association.

February 22-27-Milwaukee, Wis., Automobile Show, Auditorium, Milwaukee A. C. March-Denver, Col., Automobile Show, Denver

March 5-12-Boston, Mass., Automobile Show, Mechanics Building, Boston Automobile Dealers' Association

March-Rochester, N. Y., Automobile Show. March-Syracuse, N. Y., Automobile Show.

#### Foreign Events.

November 12-20-Annual Olympia Automobile Show in London, England.

November 19-27-Thirty-third Annual Stanley Show of Motor Vehicles in Agricultural Hall, London, England.

December 5-19—Reliability Trial for Light Cars, under direction of L'Auto, Paris,
January 28 to February 5—Automobile Exhibition at Waverley Market, Edinburgh, Scotland, under direction of Scottish Motor Trade Associa-

### THE FIELD OF COMMERCIAL APPLICATIONS.

#### Motor Police Patrol for Washington, D. C.

The H. H. Franklin Manufacturing Company have recently delivered to the police department of Washington, D. C., a motor police patrol notable for the completeness of its equipment. It has an 18 horse power engine, Bosch high tension magneto and pneumatic tires. The car body is of Prussian blue, with Usatonia red running gear; the panels are of three ply bent wood; the body is of strong and light construction. The upper part is entirely encased with wire grille work; the rear part is protected on all sides with curtains. The driver is protected from the weather by a glass front, by a mackintosh apron and by side curtains.

The vehicle is fully equipped to serve as a temporary ambulance. The cushions on the inside seats are removable and the seats are hinged so as to lift and provide space for stretchers and other paraphernalia. The space under the seats is accessible by small doors in the rear of the body. There is a medicine chest under the driver's seat, and another compartment for supplies back of the seat, accessible from the inside of the body. Two brass lanterns are instantly detachable, but are held securely against rattling when in place. The car is equipped with an 11 inch gong.

The pneumatic tires, 37x5 inches in size, are specially large for this comparatively light vehicle, thus insuring durability. Pneumatic tires have been placed on Franklin commercial cars after an experience with both solid and pneumatic tires. In front

the vehicle has full elliptic springs and at the rear semi-elliptic and coil. The weight of the car, fully equipped and with gasoline and oil, is 2,980 pounds.

#### Commercial Notes.

The authorities of Savannah, Ga., have decided not to buy any more horse drawn fire apparatus,

J. F. Hunt, of Waterville, Wash, who operates several stage routes out of Waterville, will replace his horse drawn vehicles with automobiles.

The city of Houston, Tex., has ordered a combination automobile chemical fire engine, capable of carrying a crew of nine men, which is to be delivered early in the winter.

The Pueblo (Col.) Automobile Company has placed in service a new combination passenger and freight automobile. The passenger body is capable of accommodating sixteen passengers, and may be replaced with a truck body for hauling baggage, etc.

Work has been completed on the new road between Valdez and Fairbanks, Alaska, and an automobile mail service will be inaugurated between these two points. A ferry is in operation across the Tazlina River, which is encountered on this northern roadway.

Tacoma, Wash., has recently received a 75 horse power automobile chemical and hose wagon, which negotiates some of the steepest hills in fast time. The city commisioner has also advertised for bids on two automobile fire engines and two ordinary steamers.

The Compeer Cigar Company, of Indianapolis, has placed an order for fire one cylinder runabouts to be used by incity and road salesmen. This is the company's first venture with automobiles in us business, but later, it is understood, the company will add one or two gasoline delivery wagons.

#### Parts Manufacturers Consolidate.

The Muncie Clutch and Gear Company, of Muncie, Ind., and the Wabash Ger Works, of Terre Haute, Ind., have been consolidated. The Muncie Clutch and Gar Company is a new firm, having been in business only for a few months, while the Wabash Gear Works has been operating some years. The business will henceforth be mder the control of A. W. Wagner, president and manager of the Terre Haute Malleible and Manufacturing Company, who has become president of the Wabash Gear Works in reorganization, and H. L. Hooke, formerly of Muncie, Ind., who becomes the secretary. The consolidated firms will continne the manufacture of automobile parts, such as transmission gears, progressive and selective control levers, clutches, etc.

President Clarke S. Drake of the Milwaukee (Wis.) A. C. has been appointed general manager of the Milwaukee automobile show, to be held from February 22 to 27, inclusive, in the Milwaukee Auditorium. Allotment of space will begin January 26. Pleasure cars will occupy Section A, spaces 20x20 feet costing \$125.

REAR VIEW.

### AUTOMOBILE LAW AND LEGAL EVENTS.

# Chauffeurs to Be Bonded in Louisville.

The City Council of Louisville, Ky., recently passed a measure which requires all chauffeurs to be registered and to furnish a bond for \$2,000. The registration fee is \$3 a year, and the bond costs the chauffeur \$40 a year. This measure was passed at the instance of the Sinking Fund Commission, and took the place of a former ordinance advocated by the Louisville A. C., which also required chauffeurs to take out a license at \$3 a year and to furinsh a bond for \$500. Under the new ordinance the bond must be furnished by a bonding company, which makes it quite expensive, while the \$500 bond provided for in the old ordinance would have cost only \$5 a year to carry. The ordinance has not yet passed into effect, and the Louisville A. C. held a meeting on November 9 to discuss the new ordinance and protest against it.

# To Test Washington, D. C., Wheel Tax Ordinance.

Le Roy Mark has filed in the Supreme Court of the District of Columbia a petition for a writ of certiorari, with the object of testing the constitutionality of that section of the District appropriation bill for the fiscal year ending June 30, 1910, imposing a wheel tax on automobiles in the District of Columbia. Mr. Mark contends that the present statute amounts to double taxation, as Congress in 1903 passed a law imposing a personal property tax of 11/2 per cent. ad valorem on autos, etc. He states that there are now 4,532 automobiles in the District, and that the District Government would derive about \$27,000 from the wheel tax. It has been found that the statute creating the wheel tax is defective, in that it does not provide a penalty for nonpayment.

#### No Provision for Highway Maintenance in Ohio.

All improved highways of the State of Ohio are left without any provision for their care and maintenance by a decision of the Ohio Supreme Court handed down recently. Conflicting and special laws under which pikes have been cared for a score of years were swept away by the court's decision, and the Legislature will be called upon to enact a law to fill the void. The case was that of Thorniley, auditor, and Kerr, treasurer, of Gallia County, against the State of Ohio, in which the court held that the Gallia County commissioners are not entitled to draw pay as a board of turnpike directors. The decision upholds the opinion of Attorney General Denman.

#### Business Troubles.

Lindsay Russell has been appointed receiver for the Ennis Rubber Manufacturing Company, 165 Broadway, New York, with a factory in Newark, N. J. The company was financed by Thomas A. Ennis, of the failed brokerage firm of Ennis & Stoppani, who advanced \$86,000 to the company and held \$50,000 of its capital stock. The company was incorporated under New York laws with a capital stock of \$50,000 to manufacture a flat tread automobile tire, and Fred J. Ennis, son of Thomas A. Ennis, was president. It is stated that the assets are \$15,000 and the liabilities \$130,000.

#### Indiana Registrations.

Figures taken from the record of the Indiana Secretary of State throw some interesting light on the automobile situation in that State. During the present year there have been 5,795 new registrations to November 1, as compared with 3,317 registrations during the first ten months of last year. The comparative figures are as fol-

•	1908.	1 90 <b>9</b> .
January	54	93
February	44	138

July	544	795
August	485	716
September	413	497
October	210	379

# Dust Preventives to Be Used in Milwaukee.

The city of Milwaukee, Wis., will use 200,000 gallons of a petroleum by-product, known as asphaltum oil, for treating the streets and parkways next season. An order has been placed with the Standard Oil Company for this amount. A receiving and distributing station has been built in Riverside Park. The cost will be borne by property owners, as water sprinkling now is. The latter method costs owners of property about \$1 a season, while one application of oil, sufficient for a season, will cost only from 60 to 85 cents.

#### Traffic Census in Massachusetts.

The Massachusetts Highway Commission has been taking a census of the vehicles using the improved roads of the State. The first enumeration began August 22, and the count was made from 240 stations. For that week there were 37,591 horse drawn vehicles to 27,309 automobiles. In another count beginning October 10 were found 34,423 horse drawn vehicles and 18,500 automobiles of all kinds. The percentages changed from 58 of teams to 42 of automobiles in August, to 65 of teams and

35 of automobiles in the month just closed. While the single horse, light and heavy vehicles were in a large majority, there were almost three times as many touring cars as runabouts in the automobile showing.

# Star Motor Car Company to Build Cars in Indianapolis.

Within a short time the eleventh automobile factory in Indianapolis will be established by the Star Motor Car Company. This company has just been organized with an authorized capitalization of \$100,000 and will manufacture a five passenger touring car and a line of trucks and delivery wagons. The officers are: Guy G. Shaw, president; Dr. J. W. Berauer, vice president; S. J. Summers, secretary, and W. A. Rowland, treasurer. Other directors are J. A. Diggle, J. F. Morgal, H. B. Canine, George V. Bedell, Nicholas Noe, C. J. Olson and Charles Brown. It is the company's intention to build a factory as soon as a site can be agreed on. The first cars will be brought out about January 1.

#### Auto Instruction in Indianapolis.

A number of automobile men have arranged to establish a school of instruction in Indianapolis, to be known as the Indiana Automobile College. The second floor of the building at 27-33 North Capitol avenue, formerly occupied by the Indiana Carriage and Automobile Company, has been leased, and classes will be started in repairing, assembling, driving, drafting and other branches of the industry. It is also the intention to establish night classes for those who cannot attend during the day. These classes will be held Monday, Wednesday and Friday evenings. Some time ago the Indianapolis Y. M. C. A. attempted instruction in automobile lines, which did not prove successful, and the classes were abandoned.

# Public Building for Dead Auto Storage.

Milwaukee automobile owners have been offered the use of the basement of the new \$500,000 Milwaukee Auditorium for storing their cars during the winter. The governing board has issued a circular describing the advantages of the fireproof basement. This is a new departure, and the revenue is to assist in maintaining the big public hall, which is still governed by a board of citizens representing contributors to the \$250,000 building fund. The city appropriated the remaining \$250,000 to erect the building.

The latest issue of the Reo Echo, the house organ of the Reo Motor Car Company, of Lansing, Mich., contains the 1910 announcement of the company.

### GARAGE AND SALESROOM.

#### Garage Notes.

LEBANON, IND.—Alfred and Will Lofland's garage and machine shop was destroyed by fire last week. It was insured for \$1.800.

ELGIN, Tex.—John Puckett will open a garage in W. T. Sewell's new brick building on Main street as soon as it is ready for occupancy.

AKRON, OHIO.—Martin Brothers have purchased the Wickware Building on Main street, which they will remodel for a garage and machine shop.

TOLEDO, OHIO.—The Twenty-third Street Garage Company has been incorporated with a capital stock of \$35,000 to conduct a garage and sales agency business. George C. Craig is the moving spirit.

JACKSONVILLE, ILL.—The new Estaque Garage, on West Court street, has been completed. S. R. Southerland, formerly with the Olds Motor Works, will have charge of the new establishment.

CHEYENNE, WYO.—Frank V. Wright, formerly proprietor of the Capitol Garage, has moved to Denver, Col., where he has purchased an interest in the Place Garage Company, at 1453 Clarkson street.

Los Angeles, Cal.—Blinn & Kumchan, agents for the Welch car, have secured a six years' lease on a garage now in course of erection at Nos. 1246-8 South Flower street. The building will be 50x150 feet and will cost \$12,000.

MINNEAPOLIS, MINN.—George D. Dayton is having plans prepared for the erection of a one story pressed brick and concrete garage on Tenth street and Mary place. The building will be 125x158 feet, with steel truss roof, to cost \$15,000.

COLUMBUS, OHIO.—Dr. L. M. Early has leased a 40x187 foot room at Town and High streets, in the old Lazarus Building, and will open a salesroom for the Rambler, Babcock electric and several other lines. In a few days the Early Motor Car Company will be incorporated to take charge of the business.

OMAHA, NEB.—The Capron-Wright Company have been organized with a capital stock of \$25,000, and have secured temporary quarters in the Paxton Block pending the completion of their salesrooms on Farnam street. The company will handle the Moline, Speedwell and other lines. O. J. D. Capron is president of the new company and E. E. Wright treasurer.

COLUMBUS, OHIO.—The Madison County Automobile Company, of London, Ohio, was incorporated recently by W. E. Jones, W. J. Boyd, R. W. Mead, W. H. Riddle, M. L. Burnham and J. Scott Chenoweth for the purpose of conducting a garage business and sales agency. The brick building formerly used as a livery stable by Burnham & Gordon has been leased for the ga-

rage. A number of different cars will be handled.

PORTLAND, ORE.—The Standard Motor Car Company have entered the Portland field for the purpose of handling the Ford car, and will be temporarily located at 86 Tenth street.

SACRAMENTO, CAL.—Joseph Ollier has sold his interest in the firm of Ollier & Worthington to Leon T. Shettler, a well known Pacific Coast dealer, and the firm will henceforth be known as Shettler & Worthington Company.

CANANDAIGUA, N. Y.—E. T. and H. E. Semans have purchased a property at the corner of Phœnix street and Lafayette avenue, 57x155 feet, upon which they will erect a garage and repair shop in which to conduct a general automobile agency, repair and rental business. The building will be concrete construction, and will cover the entire lot, 8,850 square feet; it will be steam heated and electrically lighted, and will cost about \$9,000.

COLORADO SPRINGS, COL. — Albert W. Marksheffel, for several years proprietor of the Colorado Automobile and Supply Company, has bought out the Miller Automobile Company. He will amalgamate the two concerns under the name of the Colorado Auto and Supply Company and will move to the Miller Garage, where he will conduct a general automobile and repair business. He is the agent for the Ford and Speedwell cars.

#### New Agencies.

UTICA, N. Y.—I. R. Gardinier, Franklin. ARCADIA, WIS.—Geo. Bohrnstedt, E-M-F. BELLINGHAM, WASH.—R. P. Rice, Ford. GRAND RAPIDS, MICH.—J. Dwight, Velie. ST. CLOUD, MINN.—The Grinols Co., Ford. CLEVELAND, OHIO.—C. F. Condon, Badger. ST. LOUIS, MO.—James J. McDonald, Knox. PERRY, N. Y.—Geo. H. Peddle, Great Western 30."

LOS ANGELES, CAL.—Ralph J. Leavitt, Renault.

WASHINGTON, D. C.—Flynn Motor Car Co., Stearns.

INDIANAPOLIS, IND.—Rambler Auto Co., Rambler.

HELENA, OHIO.-J. F. Metzler, Great Western "30."

PORTLAND, ORE.—The Standard Motor Car Co., Ford. LOS ANGELES, CAL.—H. O. Vogel, Great

Western "30."
DULUTH, MINN.—William Buchanan, Inter-

state, Peerless.
HARTFORD, CONN.- Foster & Co., 183 Allyn

street, Rambler.
NICHOLASVILLE, KY.—C. A. Kenny, Great Western "10."

PORTLAND, ORE.—Polson Implement Co.,
American Roadster.

SHELDON, ILL.—The Sheldon Automobile Garage, Great Western.

HARRISBURG, PA.—The Keystone Motor Car Co., Kline Kar. INDIANAPOLIS, IND.—Royal Wilke, 439

Tenth street, Winton.

DETROIT, MICH.—The Neal-Kitchel Motor Sales Co., Parry car.

PERU, IND.—O. B. Shutt, Great Western "10."

LONE GROVE, IA.—H. W. Meier Auto Co., Reo.
YOUNGSTOWN, OHIO.—E. J. Davis Sons,

Lozier.

MARSHFIELD, WIS.—Lang & Scharmann.

Maxwell.
CLEVELAND, OHIO.—Joseph H. Greenwald.

CLEVELAND, OHIO.—Reeves Motor Car Co.,

Detroit electric.
CINCINNATI, OHIO.—Chas. Behlen Sons Co.,

Bailey electric.
WATERTOWN, WIS.—Edward G. Buroff, 418

Main street, Buick.

JAMESTOWN, N. DAK.—The James River

Motor Co., Hudson.
WOONSOCKET, S. DAK.—The Schuyler-Me-

Curdy Auto Co., E.M.F. ST. LOUIS, MO.—Albert Stearne Motor Car Co., Great Western "30."

PORTLAND, ORE.—The Crowe Automobile
Co. of Portland. Thomas Flyer.

PHILADELPHIA, PA.—The Motor Supplies Co., 615 North Broad street, Empire "so." COLUMBUS, OHIO.—Central Ohio Motor Car

COLUMBUS, OHIO.—Central Ohio Motor Car Co., 61 East Spring street, Oakland and Oldsmobile.

BOSTON, MASS.—The Hub Automobile and Renting Co., 366A Columbus avenue, Pullman and Black Crow.

#### Trade Literature Received.

R. L. Morgan Co., Worcester, Mass.—Specifications of the Morgan 5 ton motor truck. The Waverley Co., Indianapolis, Ind.—Catalogue

of Waverley electrics for 1910.

Peerless Motor Car Co., Cleveland, Ohio.—Catalogue of the Peerless 1910 models.

Matheson Motor Car Co., Wilkesbarre, Pa.— Catalogue of the Matheson 1910 models. Murphy Electricity Rectifier Co., Rochester, N. Y.—Catalogue of the Murphy electricity rectifier.

W. H. McIntyre Co., Auburn, Ind.—Catalogue of the McIntyre motor buggy models for 1910.
Flavius G. W. Sudrow, 64 Chapin Block, Buffalo, N. Y.—Catalogue of the American Auto

Acheson Oildag Co., Niagara Falls, N. Y.— Booklet entitled "Oildag, Its Merits as a Lubricant"

Garage Equipment Manufacturing Co., Milwakee, Wis.—Catalogue of the company's automobile specialties.

S. Wohlfeld & Co., 538-540 North Third street. Philadelphia, Pa.—Circular of Wohlfeld's waterproof tire trunk.

Dover Stamping and Manufacturing Co., Cambridge, Mass.—Catalogue No. 11 of Dover automobile specialties.

Davis-Bournonville Co., 90 West Street, New York.—Catalogue of the company's oxy-acetylene welding and cutting apparatus.

The Biddison Manufacturing Co., Madison, Wa.—Catalogue of mechanical force feed lubricators for gas, gasoline and oil engines.

The American Oil Pump and Tank Co., Dayton, Ohio.—Catalogue of the company's self measuring oil pumps and tank outfits.

The Gilbert Manufacturing Co., New Haves, Conn.—Advance catalogue of Gilbert motor or accessories for the season of 1910.

S. Strunz & Son, 708 Bingham street, Pittsburg.
Pa.—Booklet entitled "How to Preserve the Bessty
of Your Automobile," expounding the merits of

Chalmers-Detroit Motor Co., Detroit, Mick.—Folder entitled "The Consistent Car," giving the record of the Chalmers-Detroit "40" in the Fairmount Park race in which it won the Consistency prize and finished second. A number of photographic views of the race are also shown.

# NOTES OF THE INDUSTRY AND THE SPORT.

#### Miscellaneous Notes.

The Motor Supply Company has been organized in Boston to deal in second hand cars.

The Muncie Gear Works, Muncie, Ind., have succeeded the High Wheel Auto Parts Company.

The Covert Motor Vehicle Company, Lockport, N. Y., have just completed a new two story 150x50 feet addition to their factory on Grand street.

Sheriff W. J. Bates, of St. Louis County (Duluth), Minn., is urging the purchase of a motor patrol for transporting prisoners between the jail and the new court house.

Thomas B. Jeffery & Co., Kenosha, Wis., announce that they will manufacture 2,500 cars during the coming year, which estimate appears quite conservative, considering the immense size of the Rambler plant.

The Phœnix Auto Supply Company of St. Louis have moved to their new building at 3974-6 Olive street, and are utilizing their former building as a wholesale office. They have also opened a branch in Kansas City.

The Michigan Steam Motor Company, Pike and Garland streets, Detroit, Mich., have begun the manufacture of steam trucks equipped with the steam motor which has been manufactured by the company for some time.

Ralph Owen, formerly with the Olds Motor Company, is to be head of a new company to be formed in Detroit with a capital stock of \$500,000, and to be known as the Owen Motor Car Company. The new concern will manufacture a four cylincar.

The Great Southern Automobile Company has been organized at Birmingham, Ala., and is remodeling an old cotton mill at the corner of Third avenue and Eighth street, that city, as an automobile factory. The car to be turned out is to be known as the Great Southern.

The Buffalo Auto Truck and Motor Company have purchased a two acre site, with a concrete factory building, in Leicester, near Mount Morris, N. Y. The factory will be reconstructed, after which the manufacture of motor trucks and delivery wagons will be taken up.

The Waldron Runabout Company, of Waldron, Ill., will shortly occupy a 50x100 feet addition to its plant, and then enter actively into the manufacture of runabouts and business vehicles. A. C. Gaylord is superintendent of the plant and E. O. Parker general manager of the company.

The Ewing Automobile Company, of Geneva, Ohio, which is now controlled by the General Motors Company, will start up again after having been idle for some months. It appears that when the General Motors Company secured control of the

concern the plan to remove to Easton, Pa., was given up.

The Behen-Faught Motor Car Equipment Company, of St. Louis, Mo., have opened a distributing depot at Farmington, Mo., in charge of Frank Kingston.

The Motor Accessories Association of St. Louis, Mo., has obtained a legal opinion to the effect that it can legally maintain a "dead beat" list for the use of its members.

The Tacoma (Wash.) Auto Drivers' Association has recently been organized with S. Blanchard as president, Guy Younie treasurer and Oscar Selzberg conductor. The association now boasts of thirty-five members.

The E. W. Clark Motor Company is successor to the Worthing-Clark Auto Company, of Fond du Lac, Wis. A reorganization has been effected, George W. Worthing retiring. The capitalization is increased from \$20,000 to \$30,000.

The Motor Supply Company, of Cleveland, Ohio, have built new offices and a new tire repair room, with additional equipment for the handling of the Empire tires, Stewart speedometers, Morgan tire chains and Galvin wind shields, for which they are distributors. The store has now an arcade running from Euclid avenue to Huron road.

The dealers of Wichita, Kan., plan to hold an automobile show in connection with the convention of the Southwestern Kansas and Oklahoma Implement and Hardware Dealers' Association December 7, 8 and 9. No building has as yet been selected for the exhibition, but it is believed that at least twenty dealers will take part.

The hill climb on the Edgewater-Fort Lee hill, across the Hudson River from New York city, on Thanksgiving Day morning, has been definitely decided on. The Edgewater-Fort Lee Motoring Society was organized for the purpose at a meeting held in the Casino Hall in Edgewater, N. J. W. J. Morgan is the representative of the society in New York.

The automobile truck department of the Brodesser Elevator Company, of Milwaukee, Wis., has been incorporated under the name of Brodesser Motor Truck Company. The elevator plant at Weil and Burleigh streets, Milwaukee, is being devoted almost entirely to the manufacture of motor trucks. The capital stock of the new concern is \$125,000. Peter H. Brodesser is president and general manager.

The Thermoid Rubber Company, Trenton, N. J., have just completed a new building of brick and steel construction. 120x120 feet, and two stories high. This building will be devoted entirely to the manufacture of automobile accessories and parts, such as brake lining, tubings, shoes, inner tubes and bumpers. All of the ma-

chinery in the new building is motor driven. Another building of the same dimensions is now under consideration.

The automobile dealers of Omaha and Council Bluffs, Ia., have agreed to hold an automobile show during the last week of February, and have formed a permanent organization for the purpose, of which Clarke Powell is secretary. There are now thirty-three automobile dealers in Omaha and three supply dealers.

The dealers of Cincinnati, Ohio, will hold their second annual show in the Music Hall February 21-28, under the auspices of the Cincinnati A. C. Gus W. Drach has been appointed chairman of the show executive committee, which also comprises J. K. Merkel and Geo. W. Cleveland. Ten other committees have also been appointed.

The Maxwell-Briscoe Motor Company, Tarrytown, N. Y., have acquired the Tarrytown Tire Works factory, which gives them 62,520 square feet additional floor space. This factory is already in operation. The company now control six plants, and upon the completion of those now in process of erection will employ nearly 6,700 people.

The Spalding Manufacturing Company, Grinnell, Ia., are erecting a three story 60x220 foot brick building, which will be devoted to the manufacture of automobiles. For 1910 the company will build about 200 cars in two models, a 30 horse power car with planetary transmission and a 40-45 horse power car with sliding gear transmission

We are informed that a Stoddard-Dayton car, Model 10-H, won the *Light and Gazette* endurance run from San Antonio to Dallas, Fort Worth, Austin and back to San Antonio, Tex., a total distance of 736 miles; that it secured a perfect road score, but was penalized 2.6 points by the technical committee. None of the other contestants finished with a perfect road score.

The American Society of Mechanical Engineers will hold its annual meeting in the Engineering Societies Building, 29 West Thirty-ninth street, New York, December 7-10. A considerable number of technical papers will be read at the meeting, and several reports will be submitted by committees of the gas power section. For Wednesday afternoon, December 8, an excursion is planned.

The Philadelphia Automobile Trade Association has secured the Third Regiment Armory, Broad and Wharton streets, for a period of two weeks, from January 15 to 29, for its annual show. Owing to the inadequate size of the building it will hold its show in two instalments, as it were, each of one week's duration, all commercial and some pleasure cars being shown the second week. The committee in charge

of the show this year consists of President Wister, W. F. Foss and James L. Gibney.

The latest addition to the firms engaged in the automobile business in Detroit is the Dearborn-Detroit Motor Company, whose organization was reported last week.

The E. Z. Auto Go-Cart Company, which recently moved its plant from Beloit, Wis., to Monroe, Wis., following its reorganization, has appointed Henry Gottstein, of Beloit, as general superintendent.

#### Club Notes.

It is reported that the A. C. of Canada has decided to take up aviation, and will in future be known as the Automobile and Aerial Club of Canada.

The recently organized Austin (Tex.) Motor Club has appointed a committee to confer with Mayor Woolbridge and other city officials regarding more satisfactory municipal automobile regulations.

The A. C. of Delaware County, Pa., is offering a reward of \$100 for the arrest of the driver of an automobile who ran down and seriously injured a man on Westchester Pike on November 6, and then escaped in the darkness.

The annual meeting of the American Automobile Association will be held at the Hotel Belmont, in New York city, on November 30, and the first meeting of the new board of directors for the election of officers will be held on the following day, December 1.

The Chattanooga (Tenn.) A. C. at a meeting held on November 5 appointed a committee to look into the matter of municipal automobile regulations in other cities and draw up an ordinance based on the results of their research for submission to the City Council.

The Upper Westchester A. C., of Ossining, N. Y., plans to conduct a hill climb on the Sunset Hill near that village on Thanksgiving Day, starting at 10 a. m. There will be events for different classes according to price, as well as for stripped stock chasses, and a free for all and a steam car event.

The New Jersey Automobile and Motor Club, of Newark, has appointed a special committee, with Joseph H. Wood as chairman, to look around for more commodious quarters, as the present clubhouse at Park place and East Park street has become inadequate with the growth in membership.

The Wisconsin State A. A., at its meeting in Milwaukee last week, elected the following officers for the ensuing year: M. C. Moore, Milwaukee, president; F. P. Hickson, La Crosse, and H. L. Halverson, Whitewater, vice presidents; G. A. West, Milwaukee, treasurer, and J. T. Drought, Milwaukee, secretary.

The A. C. of Hartford, Conn., at a meeting held on November 9, criticised the manner in which the improved roads of Connecticut are being constructed, and it appeared that there was considerable bad feeling between the club and the State Highway Commissioner. It was stated that the

new Berlin turnpike. which was opened recently, is rapidly being destroyed and should be oiled at once.

The A. C. of St. Louis, which withdrew from the A. A. A. about two years ago because it could not get a sanction for a race in the vicinity of St. Louis, has returned to membership in the national organization, and an application for membership has also been received from the Detroit Motor Club.

The Worcester (Mass.) A. C. plans to repeat its annual endurance run about December 16. Official observers will be carried this year on all cars, and the members of the engineering class of the Worcester Polytechnic Institute will be asked to officiate. The event will consist of two or three daily runs of about 200 miles each.

The A. C. of Maryland held a meeting at its clubrooms, 12 West Mt. Royal avenue, Baltimore, on November 9, at which a resolution was passed recommending the following maximum tax rates for automobiles: Care of less than 20 horse power, \$6 per year; between 20 and 30 horse power, \$9; between 30 and 40 horse power, \$12; above 40 horse power, \$15.

The Chicago A. C., at a meeting held last week, passed a resolution urging the city government to properly safeguard the approaches to the bridges over the Chicago River. It is claimed that red lights and bells are not a sufficient warning, especially to strangers in the city, and the provision of gates that close automatically every time the bridge is opened has been suggested.

#### New Incorporations.

The Kentucky Quick Repair and Automobile Company, Cincinnati, Ohio.—Capital stock, \$12,000.

The Oklahoma Automobile Company, Enid, Okla.—Capital stock increased from \$10,000 to \$25,000.

Virginia Motor Car Company, Inc., Roanoke, Va.—Capital stock, \$25,000. Incorporators, W. P. Crumpacker and James Frantz.

Tidewater Automobile and Garage, Richmond, Va.—Capital stock, \$15,000. Incorporators, C. P. Weston, G. F. Burke, H. T. Gathmey.

The California Auto Livery Company, San Francisco, Cal.—Capital stock, \$50,000. Incorporators, W. R. McWood, I. M. Mauley and I. S. Lillick.

The Winters Automobile Company, Scranton, Pa.—Capital stock, \$25,000. Incorporators, A. Adair, R. Winters and J. R. Wilson. They will have the agency for the Apperson car.

The Standard Automobile Company, Wheeling, W. Va.—Capital stock, \$25,000. Incorporators, E. J. Becker, Geo. W. Row, C. E. Morris, Herman L. Abenz and Albert L. Lohm,

The Webb Motor Fire Apparatus Company, St. Louis, Mo.—Capital stock, \$300,000. Incorporators, A. C. Webb, Vincennes, Ind.; D. B. Blossom, Frank R. Tate, John

O. Glanville and H. W. Femmer, of St. Louis.

Hanley Motor Car Company, Kittery, Me.—Capital stock, \$125,000. Incorporators, A. H. Peavey, G. E. Burnham and others.

Fawcett Motor Company, Denver, Col.—Capital stock, \$50,000. Incorporators, John H. Gabriel, W. C. Fawcett and D. G. Packer.

The Chicago Auto Supply House, Chicago, Ill.—Capital stock, \$10,000. Incorporators, J. E. Brennan, Wm. J. Maher and Fred G. Allen.

Motor Car Inn Company, Wabash, Ind.—Capital stock, \$10,500. Incorporators, F. B. Walter, S. C. Cowgill, Burat Blizard and M. C. Honeywell.

The Rogers Motor Car Company, Omaha, Neb.—Capital stock, \$250,000. Incorporators, Ralph Rogers, C. A. Overholt, C. A. Ralston and T. G. Travis.

The Jacksonville Motor Car Co., Jacksonville, Fla.—Capital stock, \$20,000. Incorporators, S. A. Morris, T. J. Mason, C. B. Sloan and W. L. Muser.

The Van Da Grift Auto Car Company, Louisville, Ky.—Capital stock, \$10,000. Incorporators, Lewis J. Perkins, Geo. W. Buck and Wm. J. Van Da Grift.

The Lemly-Wood-Brownlee Auto Company, of San Antonio, Tex., has filed an amendment to its charter changing its name to the Brownlee Auto Company.

The Brosius-Sesline Automobile Company, Fort Wayne, Ind.—Capital stock, \$5,000. Incorporators, Jesse Brosius, W. O. Sesline, Henry Brosius and Andrew Brosius.

#### Trade Personals.

J. D. Donahue has been appointed manager of the Ford Kentucky Auto Company, Louisville, Ky., which has been organized to handle Ford cars in Kentucky and southern Indiana.

HERBERT McDermott, formerly with the Gibson Automobile Company, of Indianapolis, Ind., has resigned to become manager of agencies for the Motor Car Sales Company, Indiana distributors for the Peerless, Regal and Jackson cars.

CLAUDE E. Cox, who was at one time connected with the Overland Automobile Company, and later with the Interstate Automobile Company, of Muncie. Ind., is now engineer of the Wilcox Motor Car Company, Minneapolis, Minn.

NELSON T. GUTELIUS, late automobile editor of the St. Louis Dispatch, and formerly publisher of the Automobile Review, has been appointed advertising manager of the automobile department of the St. Louis Car Company, manufacturers of the Standard Six.

A. P. SLATER has severed his connection with the Aluminum Castings Company as superintendent of the Eclipse Foundry (their Detroit plant), to accept a position with the Willys-Overland Company, of Toledo. The Overland Company intend to make their own aluminum and bronze castings.

NUMBER 21

### Nut and Bolt Locking Devices.

By E. J. Bartlett.

Like the ideal non-refillable bottle, locking devices for nuts and bolts have always been a favorite problem for inventors. It would be interesting, though tedious, to review all the patents which have been issued for schemes of this nature. Probably few, if any, draughtsmen and designers have resisted the temptation to spend odd moments now and then

FIGS. 1, 2 AND 3.

in sketching out locking constructions, and many become infused with the idea that they have devised a valuable improvement, only to find that it has been covered years before or lacks some requisite of cheapness, simplicity or effective-

The locking devices mentioned below are all those which are in more or less common use in automobile practice and familiar to most readers. That they cover the ground pretty fully will be seen. Some little data is given which may be found useful, as well as suggestions for applying the constructions mentioned.

If an effective lock was the only consideration, forming a head on the end of the bolt would of course be the simplest and cheapest, but the majority of automobile nuts need to be removable without spoiling the bolt. In some few cases, where rivets are not deemed feasible, the end of the bolt may be distorted at a single point by a sharp, pointed tool. The nut may be relocked perhaps a half dozen times without necessitating the renewal of the bolt. Such a construction is permissible to lock the nuts on the bolts securing the bevel driving gear on the differential case, as removal of the gear is not often necessary, many manufacturers even using rivets.

#### JAM NUTS.

One of the oldest forms for securing nuts is the common lock or jam nut shown in Fig. 1. The ordinary proportions are to make the thickness of the heavy nut equal to the diameter of the bolt and the light nut one-half the diameter.

They are locked together by screwing them tightly against each other. When they are also tightened against the piece held in place a greater stress is brought upon the nut nearest the end of the bolt, which, therefore, should be thicker than is necessary for the one next the clamped piece. In practice the thin nut is frequently placed on top, but this is not the correct position. It is probably due to the facts that this arrangement makes a better appearance, and also that ordinary wrenches are not thin enough to turn the thin nut, when it is under, without catching against the top one.

This construction is not so frequently used in automobile practice as the cotter locked castle nut or the spring lock washer. It is not generally regarded as positive as the former, where there is any danger of the nuts working entirely off and falling into moving parts, and it is more bulky, larger and more expensive than the spring lock washer. There are places, however, where it is superior to the others, as it is tightly locked on the bolt and will stand intermittent strains. It is also convenient in some places to use the thin lock nut, as for securing a screw or stud which is adjustable for a ston.

#### SPRING LOCK WASHERS.

There are large varieties of spring lock washers regarded as standard. Like many other parts of the automobile there is very little difference in many of the so called standards which have been developed by similar specifications placed with the manufacturers. The engineers of the Association of Licensed Automobile Manufacturers are now at work selecting types and sections for a real standard which will cover all ordinary requirements. Such a standard, widely adopted, will simplify the lock washer requirements to a reasonable variety.

At the present time washers may be bought from stock varying in size from a No. 6 screw to seven-eighths of an inch in diameter. Each bolt or screw size has from five to twenty different sections of washers, clearly an unnecessary range. There are three general types, the plain, positive and ribbed. The other variations are made by the different sections employed.

The plain washer shown in Fig. 2 depends for its locking quality entirely on the pressure exerted, causing a considerable friction on the threads of the nut and bolt. The nut may be easily removed any number of times without scarring it, and there is little danger of breaking the washer.

The positive type illustrated in Fig. 3 has its ends formed in chisel shaped cutting edges or barbs. The ends are tapered, allowing the cutting edges more freedom to seat in the nut and piece which is clamped, the body of the washer carrying the compression load. This type is very positive, but if the cutting edge imbeds in the nut there is more danger of breaking the washer and mutilating the nut if often removed.

There are modifications of this type which are also widely used, which have the outer corners only turned so as to present a cutting point rather than an edge. As they are a cross between the plain and positive types in construction, so their locking effectiveness is in proportion. This latter type is preferred by many as possessing sufficient locking qualities and allowing the nut to be easily removed. As a matter of fact any of the types mentioned above give very satisfactory results and have the added advantage over the ribbed pattern of holding equally well under the head or nut of a bolt.

The ribbed type of washer shown in Fig. 4 does not seem to be so generally used now as formerly. Aside from the

FIGS. 4, 5 AND 6.

pressure it exerts on the threads its locking feature is the thin upturned rib which wedges in the thread groove on the under side of the nut. This, of course, does not apply when used under a bolt or screw head.

Lock washers are made of a crucible spring steel and well tempered to give them a maximum resistance against pressure. The inner diameter is made onethirty-second of an inch larger than the bolt size for the most common sizes.

Table I gives the sections and pressures of the most common sections of the ordinary bolt sizes. This table is based on washers with a square or rectangular section.

TABLE I.				
Bolt	Washer	Washer	Pressure When	
Size.	Width.	Thickness.	Flat in Pounds.	
3-16	1-16	1-16	150	
3/4	7-64	5-64	350	
5-16	3/8	3-32	500	
3%	5-32	34	650	
7-16	5-32	3/6	600	
3/2	5-32	34	550	
9-16	7-32	1/8	550	
36	7-32	36	500	

SPECIAL LOCK WASHERS.

Occasionally the old fashioned tail washer is employed in special places. A type of this washer is shown in Fig. 5. The washer is punched from soft steel which will bend readily, and the tails are formed at any desired angle with each other. At assembly one tail is turned upward against the flat of the bolt head or nut and the other downward over some flat adjacent surface. It may be used for locking a nut which is not often removed, but more often it is applied to the head of a bolt where the construction does not readily allow a projection to be formed on the piece against which the flat of the head could rest to keep it from turning.

One of the important parts of a car which requires secure locking is the axle nut. Popular locking devices for this part are the D washer shown in Fig. 6 and the tongue washer shown in Fig. 7. Both act in the same manner. The former is secured against rotation by slabbing off one side of the spindle and the

FIGS. 7 AND 8.

latter by milling a narrow slot in it. Either forms a positive lock and prevents any rotative movement from the bearing to be communicated to the axle

Where double nuts are used, as on the axle spindle of the full floating construction, where the nuts cannot be locked by cotter or taper pins, a lip on the outer edge of the D or tongue washer holds the inner nut stationary, and allows the outer nut to serve the function of a jam nut. Such an arrangement is shown in Fig. 8.

#### SLOTTED NUTS.

Aside from the spring lock washer the familiar cotter pin and castle nut are most frequently used. Another well known lock is the taper pin with either the small end solid or, to be more secure. slotted and spread when in place.

Nuts are sometimes made self locking,

at least partially, by slotting and pinching together, as in Fig. 9, or slotting, as in Fig. 10. In the former case increased friction is brought on the thread at one point, as the thread contour is distorted. In the latter case the same result is ob-

Figs. 9 and 10.

tained by the pressure of the nut on the piece. The harder this pressure the more distortion.

One form of patented double lock nut

trequently seen has a portion of the nut proper threaded on the outside tapered surface, and the end slotted. The jam nut screws on the taper, closing in the slots and distorting the threads, the taper thread between the two nuts locking them tightly together.

With the advent of the annular ball bearing the wire locking ring for nuts clamping such bearings on their shafts came into general use. The nuts are usually made round on the outside, with a groove for holding the wire ring. One end of the ring is bent sharply in toward the centre, passing through a drilled hole in the nut and entering the shaft.

### A Home Made Tire Tread.

#### By Theodore M. Prudden.

An armored tire tread is very desirable to a motorist, especially if the roads over which he travels are poor, but this is often an accessory which cannot be afforded. By actual trial and account an armored tire tread can be satisfactorily constructed for less than \$3.

A piece of harness leather, 21/2 inches wider than the width of the tire and about an inch longer than the circumference, should be procured for the foundation of the tread. The circumference is found by multiplying the diameter of the tire, which is marked on every tire, by 3 1-7. The leather should be nearly three-sixteenths of an inch thick, and should be examined for flaws or grub holes. Next procure at a hardware store about 400 belt hooks an inch long. In the middle of the leather mark off a strip as wide as the tire, as shown in Fig. 1, and, beginning at either end, drive the belt hooks into the leather, as shown in Fig. 2, clinching them on the other side. This order of arranging the hooks is chosen because the hooks, which slant, as shown in Fig. 3, not only afford a grip for ordinary work but also afford a side grip to prevent skidding.

Moreover, this arrangement does not weaken the tread, since, if so arranged, the holes caused by the hooks piercing the leather come in line with each other less than in any other order of placing. After the entire tread has been armored in this manner more hooks should be placed in the end which is to lap over, as shown in Fig. 4. Then one-quarter of an inch from the marked off strip punch holes 5 inches apart

and cut the leather away slantingly to the edge, as shown in Fig. 5.

This is to prevent the puckering formed by the tread when it is placed on the tire. Above each hole place a belt hook to prevent any possible ripping of these cuts. Punch two holes between each of these

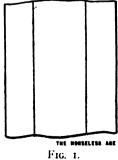

F1G. 3.

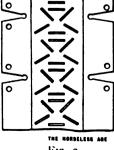

F1G. 4.

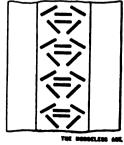

gashes through which to lace the tread to the tire. Now soak the tread in viscol or neatsfoot oil to waterproof it. Buy at some upholsterer's a piece of webbing as wide as the tire and as long as the tread. Catch it with thread in a few places to the middle of the leather and over it paste a strip of heavy paper of the same length and width. The webbing is to prevent the clinched ends of the belt hooks from chafing the tire, and the paper prevents the heat generated by a tire from sticking the rubber in a tire to the webbing.

The tread should be laced around the tire and rim, not around the tire alone, with rawhide or stout cord. It should occasionally be treated with viscol or neatsfoot oil to maintain its waterproof qualities.

The cost of the tread sums up as follows: Leather ..... \$2.00 Belt hooks.... Webbing ..... .15

\$2.90

### A Continuous Explosion Engine Indicator.

#### By Dr. Charles W. Snyder.

A satisfactory gas engine indicator would be most useful to both the builder and repair man working on internal combustion engines; not a com-

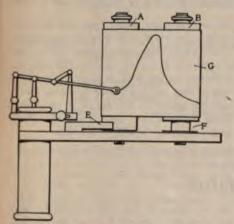

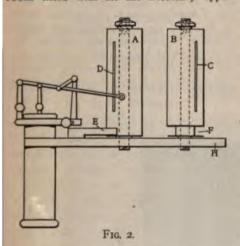

FIG. 1.-CONTINUOUS INDICATOR,

plicated, expensive apparatus which requires the motor to be on the block, and which takes a day or more to apply, but something small and light enough so that it can be attached to the engine in most any position in a minimum of time, cheap enough to be within the reach of the ordinary garage proprietor, and at the same time an instrument giving data which are fairly reliable.

The large manufacturer has his testing room fitted with all the necessary appli-

ances, but the man who does a smaller business and those who are called upon to keep cars in order have nothing whatever to tell them the condition of a motor, except its sound and action on the road. The ordinary steam indicator using a 1/2 inch or 1/4 inch piston and the hundred pound spring will be of some assistance, but it is deficient in several respects. The reciprocating motion of the drum almost prohibits securing a card at any considerable speed. The drum has two dead points where the direction of motion is reversed. The angular velocity of the drum varies

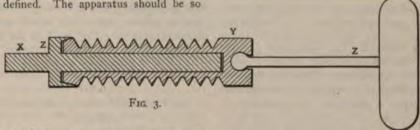

with the position of the crank. The explosion "curve" is a vertical line, as though the expansion was instantaneous, and it is almost impossible to get a single card, usually several being superimposed.

The so-called "inertia effects" in a spring operated mechanism of this kind will, of course, always be found, but my experience leads me to believe that they may be so reduced as to be negligible. I have found that in my own work most of the "waves" usually seen were due not to the vibration of the piston or its spring, but to the pencil arm, which is always light, and to lost motion in the various joints between the pencil and the piston. If these latter were set tight, just tight enough to act as a slight "drag" on the pencil arm, but few waves appeared.

For practical work the gas engine indicator should be able to operate at speeds up to at least 1,000 r. p. m. Each card should be separate, so that the lines are well defined. The apparatus should be so

parts in the ordinary steam indicator, the arm H being of sufficient length so that the two drums A and B may be mounted upon it. These drums are 1½ inches in diameter and revolve freely upon their spindles. They are slotted at C D in the same manner as the small wooden rollers carrying photographic films. A is a plain cylinder but B has a portion F cut out in the manner shown, upon which the operating cord is wound. E is a small spring brake used to produce sufficient tension on the drum A so that there will be no slack in the paper as it is wound from A to B.

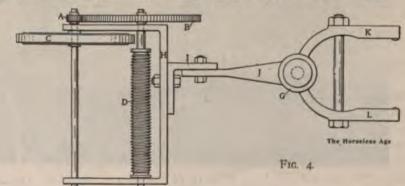

There are two methods of operating this indicator, one directly from the end of the crank shaft and the other from the rim of the flywheel. The former is the most positive, but the latter is much more convenient. We built the spindle X, Fig. 3, with the "squared cone" clutch Z and screwed the short end of the spindle into

constructed that it can be applied to any automobile engine by simply removing the hood, and used on the road if desired; and as it is impossible to get the reciprocating motion of the piston, each revolution of the crank shaft should produce a card of a given length regardless of the speed. These cards will show the efficiency of the engine, whether or not the valve openings are of sufficient size; whether the valves are suitably timed, the work required in expelling the exhaust and drawing in the new charge, the time the spark occurs; whether or not the mixture is properly proportioned, the cylinder compression, and a very close approximation of the mean effi-

These requirements seem to be fulfilled by the double drum indicator shown in the cuts. The piston, spring and linkage are practically the same as their corresponding the end of the crank shaft, then made the hollow worm Y an easy fit over the spindle.

In operation, this indicator is screwed into a plug hole in the cylinder, providing the cylinder is tapped for two plugs; otherwise a special plug may be used having an attachment at the side for the indicator in the same manner as some spark plugs are provided with a "priming cup." The end of the paper-about 5 feet longis inserted in the slot D of the drum A and the remainder of the paper is wound on this drum. The cord is wound on B at F, and the loose end of the paper is "tucked" into the slot C. The cord is then carried over a small pulley placed in a position so that it will wind on the worm Y at the end of the crank shaft, and the cord is made fast to this worm.

The engine is started and the worm is slipped over the spindle and held by the hand from rotating until the time arrives that the card is to be taken. The worm is then pushed suddenly into the clutch and the paper is wound under the pencil from one drum to the other a given distance for each revolution of the crank shaft.

In working out or adjusting an engine, the device shown in Fig. 4 is most convenient. In this appliance the jaws K L are clamped to the frame in any position where the rubber tired wheel C may be brought in contact with the flywheel, motion being secured through the joints F and G. The indicator is placed as in the first instance and the cord is brought through the pulley and attached to the worm

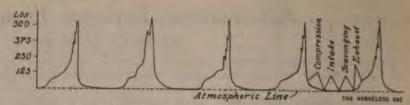

FIG 5.-CARD FROM AN AIR SCAVENGED TWO CYCLE MOTOR,

D, the engine is started and when the card is desired the wheel C is simply pressed against the face of the flywheel, and through the reducing gears A B it turns the worm D and winds the cord upon the worm. This is very convenient in carburetor adjustments and like operations. The apparatus may be applied in a few minutes, two or three "cards" run on the paper,

the driving wheel lifted from the flywheel, observation made of the card, new adjustments made and another card taken, thus getting the result of several different adjustments on one strip of paper. This work may be done at the shop or by a man on the running board as the car is being driven along the road, and the "tuning up" of an engine becomes a simple operation

# New Warner Timing Apparatus.

At the Atlanta Speedway races there was used for the first time a new electric timing apparatus invented by C. H. Warner, of the Warner Instrument Company, of Beloit, Wis., which times accurately to 100th of a second and automatically records the results on a tape similar to that used in an adding machine. The instrument consists of a relay connected with a special ship's clock or chronometer. The recording device consists of a shaft revolving at thirty revolutions a minute or one revolution in two seconds. This shaft is driven by a small electric motor, governed by an electrical governor, to run one-half of I per cent. faster than 30 r. p. m. In order to insure absolute accuracy, a disc clutch, composed of six hardened and lapped steel discs, separated by discs of parchment, is located between the recording wheels and the motor. This allows the shaft to be automatically set to the tick of the chronometer every second.

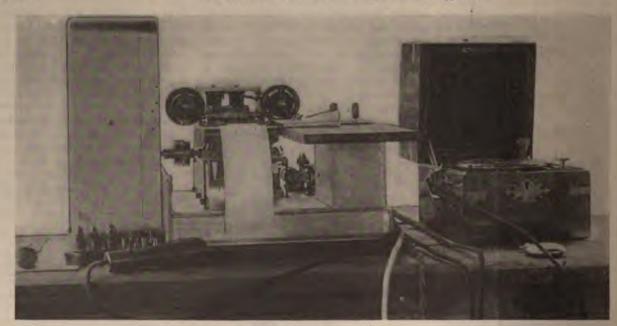

The driven shaft carries four number wheels, the first, or hundredths-of-a-second wheel, being driven by a ratchet from the shaft; the second, or seconds wheel, being held in position by a pawl which is tripped over a second by the first wheel, and a spring mechanism whereby it is indexed forward 1-60th of a revolution or one second. The third, or minute wheel, and the fourth, or hour wheel, work in the same manner. Above the number wheels is a strip of paper 2th inches wide, on which a magnetically operated hammer strikes whenever a car passes the line.

At the start of a race all these wheels are held in the zero position. The first blow of the hammer prints ciphers on the paper, and at the same time locks the hundredths second wheel to the moving shaft, which begins its task of counting. The return move of the hammer shoots the paper forward, showing the time of start recorded. Then, if desired, the time

can be caught at the mile stretch, by simply pressing forward a small switch key, such as used on a telephone switchboard.

The apparatus is operated automatically in the following manner: Across the track, about 3 inches above the ground, is stretched a small wire, one end of which is securely anchored to a post, and the other end attached to a device known as a trap which opens an electric circuit, allowing the circuit to close after the car has passed. The instant the circuit is opened the record is made, and so quickly that the eye cannot follow the movement. This electric circuit is connected in series with a pony relay, a battery, a telephone and a second trap placed at the mile line. Opening this circuit at either the mile or finish operates the relay, which in turn closes a second circuit which operates the recording hammer.

The photo below gives a good idea of the apparatus.

# Revocation of Automobile Patents in Great Britain.

The recent revocation of several of the Renault patents in Great Britain under the new Patent Act making it obligatory upon inventors to work their inventions in that country if they wish to keep them alive brings the import of this act more closely home to automobile engineers and inventors. The Renault system of locating the radiator at the dashboard so as to make the engine perfectly accessible when the bonnet is raised is meeting with considerable favor, and evidently some British manufacturer to whom this arrangement appealed, and who wished to embody it in his cars, in order to forestall any possible infringement action, made application for the revocation of this and the other patents.

Since the United Kingdom is still the best foreign customer of our auto industry it might be concluded that our trade with

that country would likely be injured by the revocation of British automobile patents held by American manufacturers, on the application of rival British manufacturers. Fortunately the success of our manufacturers in the British markets is based not nearly so much on patent protection as on superior factory organization and large scale operation. However, we should think that American inventors would in future be less eager to take out British patents unless the inventions are such that they can be readily sold to established firms, or of sufficient importance to warrant the formation of new companies in Great Britain for their exploitation. There is, of course, some possibility of an agreement being reached between our Government and that of the United Kingdom whereby the "working clause" requirement is waived in the case of American inventors. Such an agreement has just been concluded between this country and Germany, and we understand that negotiations are about to be opened with the British Government in reference to this matter. May they be successful!

# Economizing Alcohol Cooling Solution.

Solutions of alcohol are being used more extensively every year as non-freezing cooling fluids, as, aside from the fact that the alcohol evaporates rather quickly, these solutions are the most all around satisfactory cooling fluids for winter use. The question has naturally come up as to how this rapid evaporation of the alcohol may be prevented. The use of a layer of oil on top of the liquid in the radiator has been suggested, and this expedient would, no doubt, be successful in a stationary plant, but where the surface of the fluid is so much disturbed as in the cooler of a motor car it would be practically impossible to maintain a protective layer of oil on top of it, especially if the return connection to the radiator were near the level of the fluid in the cooler, in which case certainly more of the oil would circulate with the solution than would remain in the top of the radiator.

There is, however, a far more effective way of preventing the loss of alcohol which is applicable to all cars operated under such conditions that the cooling fluid does not reach a temperature above the boiling point, which applies to practically all cars during the winter months. It consists of completely closing the cooling system so

that there is no chance for the alcohol vapors to escape. The overflow pipe should be hermetically closed, as well as any vent there may be in the filling cap or elsewhere. To prevent injury to the radiator from steam pressure a small spring check valve should be secured to the filling cap or the overflow pipe so that when a pressure of one or two pounds per square inch is reached in the cooling system the steam will escape and relieve the pressure.

The advantages of this arrangement are not limited to the economy in the use of alcohol which it effects; it also should insure much greater constancy of the density of the solution, and hence of the freezing point, and would consequently relieve the operator of worry or of the duty of making constant hydrometer tests.

# "No Inherent Right to the Use of the Highway."

One more attempt to overthrow the State licensing system failed last week, when Justice Alfred Reed, of the New Jersey Supreme Court, rendered a decision in the test case brought by the White Company, holding that the law is valid in all points. The campaign planned before the case was inaugurated miscarried at the very beginning, owing to a mistake in the procedure. It may be recalled that a representative of the White Company, accompanied by a lawyer, went on a trip in one of the company's cars loaded with advertising literature from the headquarters in New York to the company's branch in Philadelphia, and the car was therefore evidently engaged in interstate commerce. Not being provided with a New Jersey State license, the driver of the car was arrested at Trenton and haled before a judge. In order to save him all inconvenience his legal counsel at once arranged for his release on bail and simultaneously applied for a writ of habeas corpus to the United States Court, overlooking the fact that there was no occasion for habeas corpus proceedings, since his client never was incarcerated. The United States Court promptly rejected the application, and the case once started had to be fought out in the State courts.

The grounds on which the constitutionality of the Frelinghuysen act was contested were, briefly, that the license fee, in so far as it exceeds the amount necessary to defray the legitimate expenses of the licensing bureau, is a tax which in connection with the personal property tax con-

stitutes double taxation; that the tax is illegally based on the rated horse power of the car instead of on its actual value, and that the State has no right to interfere with vehicles engaged in interstate commerce. All of these points were negated by Justice Reed.

There is one most remarkable passage in Justice Reed's opinion, in which he holds that there is no inherent right in any one to use the road for automobile traveling, and that the license is a privilege under restrictions. This is undoubtedly contrary to the views most motorists have held up to this time, and seems to be contrary to the other earlier court rulings, to the effect that automobiles have the same rights on the public roads as horse vehicles. We had always supposed that the public roads were for the free use of the public; that the public had an inherent right to their use in traveling about on foot or in horse vehicles. However, for New Jersey, at least, this matter seems to have been finally settled in the contrary way.

The attempts to upset the State licensing system through the courts have so far been very unsuccessful, and for the future it will probably be the best plan to seek relief from the requirement of registration of non-residents at least through the State legislatures. While opinion among motorists is divided as to the justice of taxing them for road construction purposed in their home States, there is practical unanimity regarding the injustice of taxing non-residents who may want to tour in a State for a few days, and this view has gained so much ground in recent years that now nearly all States allow non-resident motorists to use their roads for a limited time without becoming regis-This exemption of non-residents should become universal. Whether there is chance of successfully attacking the tax on resident motorists appears to be extremely doubtful after this latest decision.

#### Some Developments Due to Racing.

There is no doubt that certain improvements in construction and developments in the line of accessories and equipment during the past decade have been due to the rules made by those governing the sport to keep either weight, horse power or outside help in races within reasonable bounds. It was rather amusing in the earlier races to see a car enter a control or supply station, and perhaps as many as a score of men jump to different parts of the machine to

replenish water, oil or gasoline, or to clean or adjust various parts and perhaps to replace tires. As car speeds increased the tires could not well withstand the strain of the long races, and tire controls became more and more frequent until a race became largely a matter of the number and celerity of the control attendants rather than the intrinsic merits of a car. To put an end to this abuse a rule was adopted in France for 1006 which forbade anyone but the driver and his mechanic doing any work on the car other than the possible replenishment of supplies. The designers at once saw that this rule would have the most important effect in connection with tire changes, and they naturally set about for some means of reducing this labor as much as possible. This effort resulted in the invention of the demountable rim. The results of the races of 1906 clearly showed the benefits of this device to the industry, and it became universal on all racing cars

The rule of 1906 and the demountable rim also brought on another improvement. Formerly it had been the custom in case of tire trouble to run into the nearest control on the rim. As under the new rule no outside help could be obtained at the control it soon became the custom to carry the extra tires and rims on the cars, and to make the changes on the spot. It did not take long to discover that if the tools and tires were readily accessible, considerable time could be saved on the change. Hence considerable ingenuity was used in the method of carrying the tires, as well as in the position and method of carrying the tools. The jack was placed convenient to the mechanic so that he could get hold of it before the car came to a standstill, and the bit used for the removal of the rim was placed handy to the driver. However, it is probable that the greatest ingenuity has been exercised in the method of carrying the spare tires.

On the other hand little has been done in this direction on pleasure cars which have been equipped with demountable rims. In fact, it is probable that the removal of the spare and the replacement of the damaged tire in the tire carrying device of the average pleasure car equipped with this type of rim takes more time than all the other operations put together. In many cases the irons and straps used for carrying spare casings are used without any change. These were well enough when it was the exception rather than the rule to change a shoe on

the road when tire trouble occurred. Many of these devices use three or more inaccessibly placed straps, and require one person to hold the tires in place while another secures them by the straps.

An examination of various cars in two recent road races showed quite an interesting variety of ways of carrying spare tires so that they might be instantly accessible in case of need. In one case, at least, no strap or other fastening was used to secure the tires in their place, the rack being a sort of skeleton basket. In another instance a spring actuated bolt or locking bar was used. In most instances a single trap and buckle were very accessibly located. In fact the method of carrying tires seemed to reflect the individuality of the drivers, as they often differed widely on the same make of car. Many of these devices may appear unsightly to some persons, but in cases of this sort one should bear in mind the old saving, "handsome is that handsome does."

It is to be hoped that those manufacturers who equip their cars with demountable rims for 1910, either regularly or as an option, will give more attention to the method of carrying the same than has been given the problem heretofore.

# Novelties in Car Design and Accessories Seen at the Atlanta Show.

By H. H. Brown.

There is one fact which is so evident to those who attend the larger automobile shows with anything like regularity as to be almost unnecessary to mention it, and that is the tendency of the older makers to stick to what may be called standard construction, and to avoid anything in design which may be said to have the taint of freakishness about it. There is also a tendency, which grows stronger and stronger every year with these same established makers, to stick to the general lines which have made them successful, and not to alter their models except in the smaller details and what may be strictly called refinements. However, now and then we come to some exception to this rule.

#### VALUE OPERATION

One firm, the Dayton Motor Car Company, for instance, who have for a number of years been successful with an overhead valve motion employing a single rocker arm actuated by a single rod which operates both inlet and exhaust valves, have this year abandoned this form of valve motion, although in the past it was, from a purely mechanical standpoint, all that could be desired. This change was made because they believed. after trial, which was satisfactory to themselves, that better results could be obtained from their motor if the inlet valve were opened slightly before the closing of the exhaust. Of course with the single rocker arm this was impossible, hence the change. In place of the single rocker arm two are employed, each worked by a separate cam shaft on opposite sides of the motor. The valves are placed on the same diametrical line of the cylinder, and are not offset; in fact, except for the lugs which support the pivot bearings of the rocker arms, the cylin-

ders remain precisely the same as with the old form of valve motion.

#### DEMOUNTABLE POWER PLANT.

The introduction of the automobile for commercial purposes has led to various modifications to reduce the cost of repairs and the time taken to effect them. A rather interesting example of an effort in this direction is a form of construction used on the Sultan taxicab. In this machine the motor and its auxiliaries, including the radiator, as well as the clutch, transmission and dash, are mounted on a sub-frame in such a manner that they can be removed bodily from a cab and an entirely new power unit substituted for it inside of thirty minutes. It will be readily seen that this reduces the amount of capital necessary to invest in order to keep a certain number of cabs running. Also, the amount of necessary garage space is greatly reduced, and, owing to the much greater accessibility of the parts when the power unit is removed from the cab, repairs can in many cases be accomplished with much greater ease and celerity.

#### CARBURETOR NOVELTIES.

The carburetor question seems to be as yet an unsolved problem to quite a number of the makers. Many still stick to the type which employs a fixed size of jet while running, and attempt to keep the mixture constant by means of some sort of a suction operated air valve. There seems, however, to be a decided tendency toward that type of carburetor in which it is attempted to solve the problem by altering the jet area as well as the air opening in order to maintain the mixture constant. The Stevens-Duryea Company have this year introduced a new model in which this form of regulation is used, the suction operated air valve opening the needle valve wider and wider as the auxiliary air valve is opened, the spring being so proportioned as to give almost a constant tension throughout its range of action. The Stoddard-Dayton firm this year employ a carburetor that has two jets, one with a constant opening and the other controlled by a needle valve, which is opened by the action of the auxiliary air valve. Wheeler & Schebler, one of the best known firms making carburetors for the trade and individuals, have this year introduced a carburetor designed to work along these lines. However, in this case the needle valve is controlled by the action of the throttle.

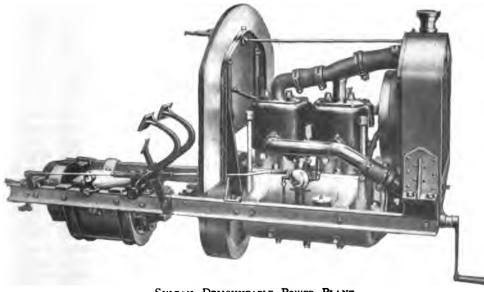

#### PREVALENCE OF MAGNETO IGNITION.

While carburetion practice is by no means near standardization, the matter of ignition seems to be in a fair way toward that end. Magneto ignition is all but now universal; in fact, the lowest priced car in the show was equipped with a magneto. However, there is a great tendency on the larger cars to provide another complete ignition system, using coils and batteries for a standby. This is also very useful in detecting faults in the magneto system, as well as for starting up either on the switch or by the crank when cold. In this case there seems to be no decided tendency one way or the other, either toward the single coil and distributor or toward the four or six unit coil. There does, however, seem to be a decided tendency toward the use of the master vibrator of some form or other, either of the unispark or the regular magneto type. In fact, almost the only exception to the universal use of the magneto was furnished by the manufacturer of a car equipped with a two cycle motor, who employs a well known unispark system which is inoperative when the machine is turned over backward. This is a very desirable feature with most two cycle engines, which run with equal facility in either direction.

#### THE MASTER VIBRATOR.

An interesting new construction is used this year by the Connecticut Telephone and Electric Company, who have for the first time shown a master vibrator at this show.

A rather novel feature is the use of a double master vibrator. The unit on which this is mounted has a vibrator at either end. Simply placing the unit in the coil box connects up the upper vibrator so that it will operate. In case of the vibrator in action getting out of adjustment it is only necessary to remove the unit, turn it over and replace it, and the other vibrator blade will be brought into action. A minor feature of this coil is the use of hard rubber cylindrical coil cases, with metallic bands sur-

SULTAN DEMOUNTABLE POWER PLANT.

rounding them, which serve to complete the contacts with the springs in the coil box. A button is placed on top of each of these units for the purpose of breaking the primary circuit to that coil, and thereby cutting out the ignition to any particular cylinder. This new form of unit is also made in the regular vibrator type as well.

#### NOVEL MAGNETO.

A rather interesting form of magneto which is used to spark a four cylinder coil without a distributor, known as the "S X," is shown by the Lutz-Lockwood Company, of Aldene, N. J. With this magneto two

TYPE "S X" MAGNETO.

separate transformer coils are employed with spark plugs in series, one coil sparking cylinders 1 and 4 and the others cylinders 2 and 3. Two contact breakers, spaced 180 degrees apart, are employed. The current is led to the live points of both circuit breakers by means of collector rings and brushes.

The circuit breaker levers ground their respective terminals to the frame of the magneto; therefore, ordinarily the magneto is working under a short circuit. The live ends of the circuit breakers are connected to one pole of the primary of one of the coils, and a common wire leads the current back to the frame of the magneto from the coil box. Now, when the current is interrupted by the breaker cam striking either of the circuit breaker levers, the current will flow to the particular coil which that particular circuit breaker operates, thus inducing a current in the secondary, the return, of course, being by the ground wire which is common to both coils.

A rather interesting development in con-

COIL USED WITH "S X" MAGNETO.

nection with battery ignition on motorcycles is the use of a specially wound coil which will operate on two dry cells. The object of this is to save weight and space on the machine. It is said that these coils give remarkably good results in battery economy.

#### PRACTICE IN LUBRICATION.

In the line of car lubrication there is a decided tendency toward simplicity and the use of splash systems and circulating systems in which the coil is led through large ducts to the various parts, the excess oil falling into a sump to be again circulated as needed. This system has been successfully used on the Chalmers-Detroit and also on the Marmon cars. On motorcycles splash systems, pure and simple, are employed, and these have been so thoroughly worked out and perfected that probably no change is desirable. However, this year has brought forth a marked change among almost all of the American makers in the method of feeding the oil. Formerly, this was done intermittently at stated periods by a small hand pump or measure. This year most of the makers have adopted some constantly operating measuring or pumping device. The Indian and Merkel employ a small plunger pump, with adjustable stroke, this making about one stroke to thirty revolutions of the motor. The Thor Type IV, however, employs a small revolving measuring device.

#### TIRES AND RIMS.

In the line of tires nothing of a very radical nature was shown. There were none of the solid rubber tires designed to replace the regular pneumatic in its proper field, although there were a number of solid tires shown designed to be used for heavy commercial machines. There is one tendency which seems to be growing more marked every year, and that is the tendency for every tire maker to adopt some form of all rubber non-skid tire. The projections on these are of various shapes and variously arranged. The latest shapes seen are Maltese crosses. A rather interesting example of this type was a motorcycle racing tire. This tire was designed for racing on board tracks which are insufficiently banked for the speed the machine is capable of making.

A non-skid, as is well known, will to a certain extent slow any machine. To overcome this difficulty this tire is made with three ordinary circumferential corrugations at the centre of the tread, which when the machine is running straight ahead are alone in contact with the ground, but on rounding a curve when the machine lays over there are two rows of cylindrical projections on either side, which then perform their non-skidding functions.

#### NOVELTIES.

Probably the majority of the cars exhibited were fitted with quick detachable rims. Comparatively few are equipped with clinchers, and there seemed to be an increasing tendency toward the use of demountable rims. The new Marsh rim has been considerably altered from the last year's pattern. In the first place, only one ring is used, the ring which was formerly placed next the tire having been dispensed with, the locking ring now performing the functions of both. The ends of this ring have hooks which fit into an open slot in the side of the rim and face toward each other. This virtually forms a T shaped slot into which a T shaped bolt of ample dimensions is fitted. A box shaped piece, known as the cap, fits over

the hooks. The outer sides of these are somewhat tapering in a direction radial to the wheel, and the sides of the cap are flared to fit this taper. The result is that when it is put in place and the nut screwed up against the lock washer there is a powerful contracting action on the ends of the ring and it is securely locked in place. It is practically impossible for this rim to rust in place so that it cannot be removed with ease.

Quite a number of demountable rims were shown, most of these having been on the market for some time. Among these was the Firestone. This is practically unchanged as far as the rim itself goes, but a rather neat idea was shown in connection with it which greatly facilitates the change. Instead of using the ordinary nut which is affixed to the valve stem after the rim is in place on the wheel, a sleeve is placed around the valve stem against which the valve cap is screwed. This permits the tire to be removed or replaced with-

WOODWORTH TIRE CHAIN.

out the necessity of screwing and unscrewing the valve cap and washer each time that a change is made. The valve hole, of course, is enlarged to allow the passage of the cap. The new Empire rim was exhibited for the first time at this show. This rim was described in a recent issue of this paper.

Rather a novelty in the way of a nonskid chain is the Woodworth self tightening chain. A unique feature of this chain is the use of leather pads underneath the chains which protect the tire tread from undue wear. The self tightening feature of this chain consists in the use of a "cinch" strap on either side, the two ends being connected by a strap which is given a turn around one of the spokes, the whole being drawn up reasonably taut. When any looseness occurs the chain will, of course, tend to creep. The strap is passed around a spoke forward of the "cinches," so that the creeping tends to tighten up the "cinch."

A little device known as the universal anchoring device for securing "blow-out" sleeves in place is rather interesting. This consists of a small casing which contains a couple of reels on which are wound straps. Small ratchets are fitted to the reels, and the ends of the straps have hooks to secure them to the tire

UNIVERSAL ANCHORING DEVICE.

sleeve, which has suitable arrangements for this purpose. A U shaped piece is fitted to the device to secure it in the proper position on the felloe of the wheel. Two of these are used to a tire sleeve. A strap is also fitted to the sleeve which is used to prevent creeping.

#### SEAT STARTERS.

Self starting or seat starting devices do not seem to make much headway. Two cars were seen equipped with devices of this sort, in which compressed air is used to turn the engine over until it has picked up its cycle. There is one advantage about devices of this type, and that is that the method of getting up the pressure, whatever it may be, is capable also of use for power tire inflating. The desirability of such a device is apparent to almost any experienced motorist. The Pierce car had a small pump fitted simply for this purpose. It is of the two cylinder opposed single acting type, the two pistons being integral and a single connecting rod being used. The dimensions are about 1x2 inches. The pump is secured to the chassis frame on the left side. It is driven by a sliding gear which is placed on the circulating pump shaft. This gear slides on a feather and has a ball catch which holds it in or out of engagement with the pump gear. To put the pump in action the gear is put in position by hand with the motor at rest, no lever or other shipping mechanism being employed. There is a reduction of about one to two to the

Returning, however, to the matter of self starting devices—a spring actuated device of this sort was on exhibition in one of the tent shows, and it certainly worked all right on the car to which it was fitted, a small Ford runabout. A pedal operated device was also in evidence at the show which was very well worked out. A safety device is fitted to

this which automatically throws the dog catch out of gear as soon as the flywheel commences to move backward. The mechanism is quite ingenious and is worthy of a more extended description

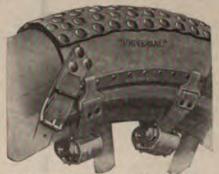

#### SIGNALING DEVICES.

Probably there is no accessory on which more ingenuity has been lavished than on signaling devices. The Gabriel Horn Company are regularly marketing this year a four note keyed horn on which bugle calls can be played. Besides this they also have a ten note horn on which most of the simple melodies can be performed with more or less artistic effect, depending on the musical ability of the driver.

Probably there is no motorist of any experience who has not got caught out after dark with some trouble where a light in the right place would have been a great boon. The Standard Auto Supply Company, of Chicago, showed a device of this sort which will appeal to those who have met with trouble at night. It consists of a small incandescent lamp mounted in a reflector with a band attached to it by means of which it can be secured to the forehead, thus leaving both hands free to work and at the same time throwing the light in the direction in which the wearer of the device is looking.

#### SPEED INDICATORS.

Perhaps one of the greatest novelties in the show was the Shipman speed indicator, made by the Shipman Instrument Company, of Sudbury, Pa. In the first place, the principle of operation of this device is one which heretofore has not been applied to automobile speedometers, although it has been used very successfully for obtaining the velocity of the wind in connection with anemometers. The principle referred to consists in timing motion through a fixed distance. The

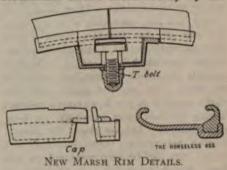

· Universal Emergency Tire Sleeve.

instrument, in addition to giving the speed at any given time in miles per hour, also keeps track of the actual running time of the machine. It is made in various models, and one of these is arranged with two hands, one a long one indicating the speed in miles per hour, the other a shorter one on the same shaft being a trip running time dial indicating the number of hours the machine is run-

ning. Above this is a counter which indicates in figures the number of running hours in a season. To the left are placed a trip and season odometer. It will be seen that the average rate of speed can be easily calculated at any time from the two trip records. This feature is especially useful on commercial cars, particularly of the heavier type, when it is desired to make sure that the driver does not habitually exceed a given rate of speed.

This device has its time recording mechanism wound automatically by the

motion of the driving mechanism of the odometer. One specially good feature of the device from the mechanical standpoint is the fact that all parts are comparatively slow moving.

#### The Canadian Show.

The Canadian Automobile Show will be held in the St. Lawrence Arena, Toronto, under the auspices of the Ontario Motor League, from February 24 to March 3, 1910. E. M. Wilcox, secretary of the league, will be manager. He believes that the show will be the largest of its kind ever held in Canada, as there is an unprecedented increase in the sale of automobiles in Canada at present, and the number of automobile and accessories firms in business in Canada is double that of last year. The Ontario Motor League, which is the association of automobile owners for the Province of Ontario, is taking an active interest in promoting the show. It proposes to have the annual convention of members and others interested in goods roads during the week of the show. consisting probably of a three days' session and a banquet. Leading authorities on good roads from the United States will be invited to attend and address the convention. The St. Lawrence Arena, in which the show will be held, is a large building owned by the city. An elaborate plan of decoration will be carried out, and every effort made to make the show of national character.

#### Pittsburg Show.

The Pittsburg Automobile Dealers' Association at a meeting held on November 11 decided to hold its annual show in the Duquesne Garden in April, immediately after the closing of the ice skating season there. The following show committee was appointed: Frank Saupt, chairman; Geo. P. Moore, Mr. Newell, W. M. Murray. The association now comprises twenty members.

### GARAGE AND SALESROOM.

# The Sea Gate Garage, Sea Gate,

Situated on the outskirts of Sea Gate, a private residence park at the extreme southern end of Coney Island, N. Y., this garage enjoys unique opportunities for securing business during the summer season. The main building is located just within the private grounds, about a block from Surf avenue, and the repair shop is on the opposite side of the boundary street (West Thirty-seventh street). The main building is one story in height and of reinforced concrete construction throughout, including the roof. It is 100 feet square, with the roof supported on one large central column, leaving the floor space unusually free from encumbrances. The cut shows the general interior appearance. One hundred and twelve cars can be accommodated on this floor, though seventy-five is as many as have yet been stored in the building at any one time. As will be seen from the floor plan, the window lighting is liberal, and is augmented by a skylight 12 feet square in the centre of the roof. Four flaming electric arc lights furnish ample illumination at night. There are two entrances, one on West Thirty-seventh street and one within the park. No provision is made for heating either of the buildings, for the business season lasts only from May I to October 1. Both buildings are fireproof, and no fire

extinguishing apparatus other than a few hand extinguishers and sand in barrels is

The supply room and office, 16x20 feet in

kinds. On sales here, as well as on gasoline, oil and all repairs, the triplicate check system is in use. The room is furnished with three large show cases, and all the

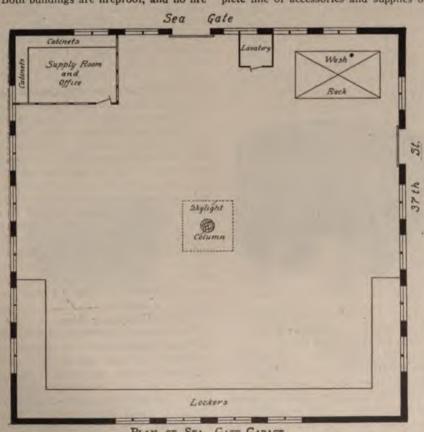

INTERIOR OF THE SEA GATE GARAGE.

dimensions, is located in one corner of the building, and is stocked with a very complete line of accessories and supplies of all

available wall space is used for cabinets and drawers. Gasoline is stored below ground, 30 feet from the building, in a 315 gallon Bowser tank, from which it is pumped as needed. Seven grades of lubricating oil are carried in stock, the oil sold by measure being stored in 60 gallon portable cans. One wash rack, fitted with overhead water connections, is located in a corner of the room. Large, roomy sted lockers for the use of patrons are arranged nearly half way around the building, and a lavatory, about 8 feet square, is located conveniently near both entrances.

All repair work is carried on in the smaller building, which is a one story structure, 40x100 feet. The machine shop occupies a space 20x25 feet in one corner of this, and is equipped with two lathes, a planer, a milling machine for cutting gears, a large and a small drill press and a grinder. A 5 horse power electric motor furnishes the power to operate these tools, and also drives the air compressor. The latter is so arranged as to automatically keep up a pressure of 110 pounds in a 10% cubic foot storage tank. From this tank a pipe line 550 feet in length conveys the air to the main building, where it is distributed to various wall connections. Here also is located a General Electric rectifier for transforming the alternating current supplied from the mains into direct current for charging storage batteries. The charging outfit is capable of charging the batteries

PLAN OF SEA GATE GARAGE

of four ordinary electrics at one time. Benches are liberally provided. The equipment of the shop also includes a complete brazing outfit and a vulcanizer for tire repairs. The floor space will comfortably accommodate about eight cars on repair, and there is one concrete pit.

Comparatively little renting business has been done in the past, but for the next season this garage will be a branch headquarters for the W. C. P. Taxicab Company, with main headquarters at Broadway and Fifty-sixth street, New York city. Twentyfive taxicabs are to be stationed here, and a flat rate of \$6 will be charged for the trip from that section to any part of the Borough of Manhattan. The local agency for the Stearns cars is also to be placed with the proprietors of this garage, but no display stock will be carried.

While in the past a considerable amount of transient business has been done in addition to that regularly obtained from the local summer residents, it is quite probable that there will be an increase in transient trade with the opening of two new streets terminating at Sea Gate, one leading to Coney Island and the other along the Bay Shore to Bath Beach and thence to Brooklyn. Both of these streets are to be made excellent automobile roads, and will undoubtedly attract many motorists. Practically all the automobilists going to "the island" now travel over the roads entering at a considerable distance to the north of Sea Gate, but with the opening of a route along lower New York Bay it is to be expected that a great deal of the auto traffic will be diverted in that direction, and this garage will then be on a direct highway from Coney Island to Brooklyn and New York.

Motor Mart for Columbus, Ohio. Columbus, Ohio.—The Charles Schiear Motor Car Company, which has a Columbus branch managed by C. Roy Clough, has closed a lease for a salesroom at the corner of Fourth and Spring streets. The new building will be ready for occupancy about December 15. The company will handle the Hupmobile and the Velie. The Franklin Motor Car Company will take a portion of the same building for salesrooms for the Franklin and the Reo. The Speedwell Company, of Dayton, have taken a lease on the south room of the same building for a Columbus agency for the Speedwell. The building is being constructed by Caleb L. McKee.

#### San Diego Dealers Form Association.

The San Diego Automobile Dealers' Association has been organized at San Diego, Cal., with J. W. Swan as president; F. B. Nailor, vice president; Wilson Smith, secretary, and Warner M. Bateman as treasurer. The association starts with a membership of sixteen, including practically every dealer in the city, as well as several

garage owners who do not handle cars. The objects of the association are to prevent price cutting, to work together for the improvement of roads and to boost the fair planned for 1915.

#### Fenestra Metallic Sashes.

We show herewith a photograph of a . Fenestra steel sash window, the construction of which was described in our last week's issue. This sash, which is particularly adapted for garages, etc., offers the advantage that it forms a steel grating and gives protection from thieves.

#### Garage Notes.

BAINBRIDGE, GA.—The Caldwell Automobile Company are now occupying their new garage.

SCRANTON, PA.—The Anthracite Motor Car Company will occupy a garage at 625 Lackawanna avenue.

PITTSBURG, PA.—D. A. Dyche is preparing plans for the erection of a \$50,000 garage at Center and Craig streets.

PEORIA, ILL.—The Country Club is endeavoring to secure a site for a garage to house the cars of its members.

CHESTERTOWN, DEL.-J. H. Sides has purchased the Armstrong Hotel property, which he will convert into a garage.

KANSAS CITY, Mo.—S. E. Montgall has secured a permit to build a garage at 1011 East Fifteenth street, to cost \$16,000.

FALMOUTH HEIGHTS., MASS .- J. F. Randall has purchased a lot at No. 117 Grand avenue and will build a garage on it.

PHILADELPHIA, PA.—A. C. Trammell, of the local Vesta Battery agency, has joined G. Hilton Gantert in conducting the Stearns agency.

LAKEFIELD, MINN.-N. W. Weis has gone to Osage, Ia., to engage in the automobile repair and general machinery business in that town.

MILWAUKER, WIS .- Dr. Fred Heinemann has let a contract for the building of a 40x70 foot solid brick garage at Juneau, and Market streets.

PHILADELPHIA, PA.—Solomon Greenberg has bought the southeast corner of Broad and Dauphin streets, upon which he will erect a four story fireproof garage.

MINNEAPOLIS, MINN.—The garage of Dr. C. D. Whipple, 2737 Chicago avenue, was destroyed by fire. A \$3,500 automobile and a stock of supplies were also consumed.

DENVER, COL.-Milo A. Smith has plans for a \$6,000 garage to be built at Colfax and Josephine streets, facing the City Park esplanade. Work will begin immediately.

NEW YORK CITY, N. Y .- W. & J. Sloane, the large carpet house, have bought a plot of land, 541-547 West Twenty-ninth street, upon which they will build a garage and stable combined.

DETROIT, MICH.-The Great Western Automobile Company, of Peru, Ind., have established a sales branch at 878 Woodward avenue, under the corporation name of the Great Western Automobile Company of Detroit. The new branch opened for business on the 15th.

WICHITA, KAN.—E. W. Ames Motor Car Company, corner of Water street and West Douglas avenue, will soon move to their new white stone and concrete garage on North Main street.

Louisville, Ky.—The Banks Motor Company, agents for the Ford car, are located in temporary quarters at King's garage, on Second and Guthrie streets, until their new quarters are finished.

SCHENECTADY, N. Y.—B. A. Burtiss has arranged for a course of instruction for automobile owners and drivers at his garage in Barrett street. Lectures will be given three nights a week, beginning Novem-

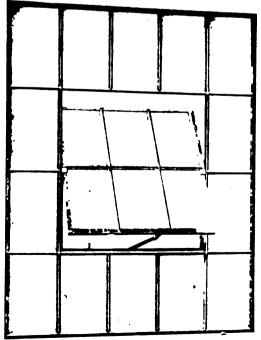

PHILADELPHIA, PA.—The Motor Supplies Company, agents for the new Empire "20." have secured permanent quarters at 608-10 North Broad street. The building has been remodelled to meet the requirements of its new occupants.

PORTLAND, ORE.—Howard M. Covey, of the Covey Motor Car Company, has purchased the one-third interest of Dr. E. G. Watts in the company for \$25,000. Mr. Covey is now the sole owner of the busi-

NEWARK, N. J.-James S. Holmes will erect a garage in the rear of his residence on Park avenue and Day street. It will have twelve apartments, which he will rent to automobile owners in the neighborhood.

SEATTLE, WASH.—The Buick agency is to be managed this season by Louis Cohen. who has secured temporary quarters at the Eureka Garage on Broadway. Before the season is well advanced, however, the agency expects to have a well equipped garage of its own.

VINCENNES, IND .- The Johnson Auto Company, whose garage is on South Second street, in the old skating rink, have in-

FENESTRA WINDOW SASH.

augurated an automobile service to and from Union Station on a popular rate basis. A night service will be maintained for the accommodation of theatre parties, dances and trains.

ROCKVILLE, IND.—The Rockville Automobile and Harness Company's building in the Harrison block was destroyed by fire last week. There was only \$4,500 insurance on the building.

METUCHEN, N. J.—A garage is to be opened by the Metuchen Automobile and Garage Company, of which John C. Bowers is manager. The building is of concrete and will be ready for occupancy November 25.

DENVER, COL.—Harold Brinker has retired from the Brinker-Vreeland Company and joined the Johnson-Fletcher Company. B. F. Vreeland will continue the business of the first mentioned firm, which handles the Moon and Matheson, and the Rauch & Lang electric.

Los Angeles, Cal.—The Angeles Motor Car Company has been organized here with L. L. Brentner, formerly manager of the Standard Motor Car Company, president; S. M. Dutcher, treasurer, and C. W. Mc-Cabe, secretary, to handle the Coast agency for the Rider-Lewis car.

INDIANAPOLIS, IND.—The Shoemaker-Smith Automobile Company is being organized for the purpose of conducting an agency for the Parry cars. A lease on quarters in the new Pennway Building has been arranged and the company will begin business about December 1.

COLUMBUS, O.—The McDonald Automobile and Livery Company, with a capital stock of \$50,000, was incorporated recently to establish a garage and sales agency at 1082 North High street. M. J. McDonald has been elected president; J. A. Taft, secretary, and Fred T. Jones, treasurer.

SEATTLE, WASH.—The F. A. Bardshar Automobile Company has been formed to handle the Stevens-Duryea car in Seattle and western Washington, and will soon erect a garage. The company is composed of F. A. Bardshar, formerly Stevens-Duryea agent in California, and Thomas G. Young, formerly with the Olympic Car Company, of Seattle.

TOLEDO, OHIO.—Alfred W. Norris, formerly manager of the Norris Auto Company, of Saginaw, Mich., and more recently Buick branch manager in Toledo, has organized the Norris-Toledo Motor Sales Company, of which he is treasurer and manager. The company will handle the Demot, Parry and Velie cars. A salesroom has been opened at 623-625 Madison avenue.

Boston, Mass.—The Overland Motor Company of Boston has been organized here to take over the Overland business in this city from the Linscott Motor Company, who have been handling the Reo and Overland. The new company will have temporary headquarters at 124 Columbus avenue until the new salesroom at 161 Columbus avenue, now occupied by the B. F.

Goodrich Company, is fitted up. Chas. G. Andrews, who has long been associated with the Linscott Company, will be manager of the Overland Company.

FORT SCOTT, KAN.—Kearns & Glunz, who recently secured the Mitchell agency, will erect a 50x120 feet concrete garage and salesroom in a central location.

PATCHOGUE, N. Y.—W. F. Morell & Son have torn down the north part of their building on Peconic avenue, and will build a two story garage in its place.

· SALEM, ORE.—The Cherry City Auto Company, recently organized, have secured the building to be vacated by the Portland Railway Light and Power Company for a garage. They are agents for the Rambler.

POUGHKEEPSIE, N. Y.—Charles H. C. Tiffany, of the Tiffany Machine Company. has purchased a plot of land on Market street opposite the Adriance Memorial Library, on which he will erect a garage and machine shop.

ASHEVILLE, N. C.—The Asheville Cycle and Automobile Company, on Lexington avenue, utilize the surplus heat from the boilers of an adjacent laundry to heat their garage. A hood was placed over the boilers, and an electric fan draws the heated air into the garage.

GERMANTOWN, PA.—George Waldman has submitted plans to the Pomeroy Construction Company for the erection of a two story and basement brick garage on Johnson and Jefferson streets. The building will have a finish of ornamental stone and terra cotta trimmings.

CREIGHTON, NEB.—The Creighton Automobile Company have reorganized, and will install a complete modern garage and repair shop. They will also carry a full line of supplies and accessories. F. C. Largen will have charge of the repair shop. They will handle the Jackson car.

INDIANAPOLIS, IND.—G. H. Westing & Co., who have been engaged in the motorcycle business for a number of years, will add a line of automobiles as soon as a new building they have leased is completed. The building will be a three story, fireproof structure, located in North Delaware street, in Motor Row.

COLUMBUS, O.—The Love Garage Company, recently incorporated, has been organized by the election of J. P. Love, president, and F. E. Love, secretary and general manager. The concern will occupy its new building on North High street by December 1. The structure will have 15,000 square feet of space. The concern will handle the White steamer and gasoline cars.

Boston, Mass.—The Peerless Motor Car Company of New England have taken a twenty years' lease of a new six story building to be erected on Beacon street, between Raleigh and Deerfield streets. The building will have a frontage of 90 feet and an area of over 10,000 square feet, and work on it will be started at once. The deal was put through by the real estate firm of Whitcomb, Wead & Co., of which Lawrence Whitcomb, treasurer of the Na-

tional Brake and Clutch Company, is the senior member.

Kennebunkport, Me.—Henry Heckman is building a 40 foot addition to his garage.

WAKEFIELD, MASS.—Plans are being prepared for the erection of a garage at 503 Main street.

STRONGHURST, ILL.—James Brewer has purchased the Fred Fox garage, and will continue the business.

New Haven, Conn.—The Yale Field Construction Company will erect a concrete garage at 7 Dixwell avenue.

FORSYTH, GA.—The Georgia Automobile Comany, agents for the Ohio car, will soon open branch offices in Macon and Atlanta.

KANSAS CITY, Mo.—Hall Brothers, agents for the Dorris car, have moved into permanent quarters at 1110 East Fifteenth street.

OKLAHOMA CITY, OKLA.—The White-head-Thurber-Backus Company will soon move into their electric garage at 13 Harrison avenue.

JACKSON, TENN.—The Dixie Motor Works expect to be in full operation in a new automobile shop and garage by the first of the month.

PENN YAN, N. Y.—A garage and repair shop is soon to be erected in the rear of the Sherman House. The upper floor will be used to store carriages.

St. Louis, Mo.—The Central Garage Company have opened a new place at the corner of Twelfth and Chestnut streets. C. C. James is president.

GAINESVILLE, FLA.—The Gainesville Motor Car Company have taken possession of their new garage. C. W. Hill and G. Henry Davis are the proprietors.

NORWALK, OHIO.—A. W. Carpenter & Son have opened an automobile and supply store at 15 Maple street. They have the agency for the Maxwell car.

CHIPPEWA FALLS, WIS.—The "Home Gaage" has been opened by the Barker Automobile Company, representative of the Jackson and Fuller. The building, recently completed, is situated on East Spring street.

MISHAWAKA, IND.—John Z. Wilklow will erect a 100x50 feet two story brick garage at 214 Main street, on the site now occupied by his residence. The present building is being moved to the rear to afford room for the garage.

MILWAUKEE, Wis.—A. Bonnell has been appointed general manager of the New Milwaukee branch of the Mitchell Motor Car Company, of Racine, Wis. The company have erected a 60x120 foot garage at 526 and 528 Broadway.

COLUMBUS, O.—The Broad-Oak Automobile Company, which has been operating a garage and sales agency on East Broad street, has been reorganized by the election of Charles C. Kouns, president, and A. B. Whitney, vice president, to succeed O. W. and M. F. Loofborrow, respectively. Dr. I. Hoch remains as secretary and treasurer. The concern has the agency for the Pierce-Arrow, Hudson and Chalmers-Detroit.

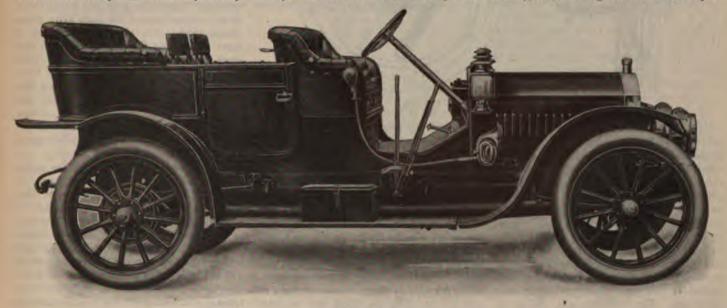

### DESCRIPTIONS OF NEW VEHICLES AND PARTS.

#### Novel Elmore Two Cycle Motor-Elmore 1010 Models.

There are a number of remarkable changes in the design of one of the models of the Elmore Manufacturing Company, of Clyde, Ohio, for 1910. The company will manufacture two chassis models for next year, known respectively

case compression used in the Elmore cars for years, but the 46 horse power motors are of entirely new design, known as the high duty type, using cylinder precompression, which is accomplished in the following manner: The cylinders have a double bore, and double concentric pistons are used. The lower portion

The incoming gas is drawn into the annular chamber D during the entire downward stroke of the piston. The gas passing from the carburetor through the manifold A, into the distributor E (which resembles a rotating valve on a steam engine, and is driven by a gear from the crank shaft), then through the distributor port

ELMORE MODEL 46.

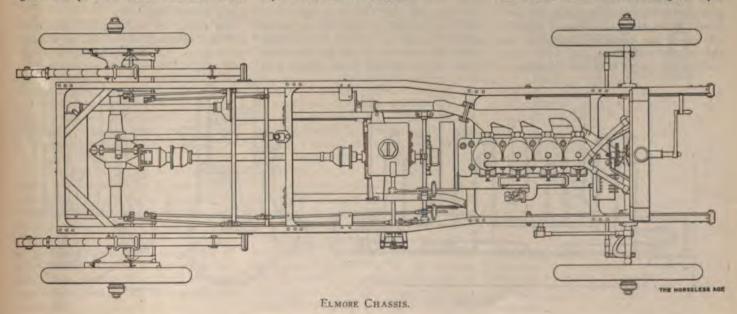

as Model 36 and Model 46, of which the former will be equipped with either a touring car, a demi-tonneau or a landaulet body, and the latter with either a seven passenger touring car or a limousine body.

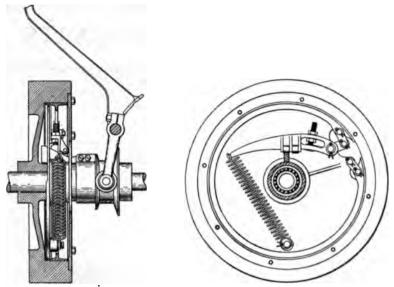

The motors of both models are four cylinder, two cycle, water cooled, with 4½ inches bore and 4 inch stroke. The 36 horse power motors use the crank

of the cylinder, where the new charge of gas is compressed before being admitted into the explosion chamber, is 6½ inches in diameter, while the upper portion, where the firing takes place, is 4½ inches in diameter. The four cylinders are cast separately and a five bearing crank shaft is used. The pistons are fitted with three compression rings at the top and two at the bottom.

B and pump by pass C, entirely filling the annular chamber D around the piston and below the firing chamber.

At the same time the gases in chamber D have been compressed in No. 2 cylinder while the previous operations were taking place in No. 1, No. 2 piston moving up while No. 1 moves down, forcing the new gas through the by-pass of No. 2 into the distributor, which has now changed its po-

ELMORE EXPANDING RING CLUTCH.

sition to admit the new gas, and on through port by-pass F, and ports H into the combustion chamber, where, upon being compressed, the gases are ignited, and at the conclusion of the downward stroke of the piston escape through port K. There is no intermingling of new and old gases, for several reasons. In the first place, there is not time enough; and the escape of the exhaust gas through the port K has an ejector effect, creating a tendency to draw in the new gas through a partial vacuum caused by the rapid discharge of the exhaust gas. The incoming gas, owing to the timing of the inlet port and the shape of the deflector plate on top of the piston, must first pass to the top of the cylinder. then filling the partial vacuum caused by the discharge of the spent gases. The motor fires 1-3-2-4.

The Model 36 motor is a simple three port motor. The top of the piston is flat, with a deflector cast on the inlet port side, while a back firing screen is located in the transfer port. The pistons are also fitted with bronze bushings in which the piston pin works, while the piston pin itself is solid nickel steel and is clamped firmly in the top of the connecting rod. The top end of the connecting rod, after being bored, is split so as to permit tightening to

the piston pin with a set screw. The rod itself is of drop forged steel, with the lower bearing cap of manganese bronze held in place by two studs. The lower connecting rod bearings are 1½ inches in diameter and 1½ inches long.

The crank shaft, which is of high carbon steel drop forged, has five main bearings, 3½ inches long by 1½ inches diameter, and is heat treated and ground. The crank case is of aluminum alloy and cast in two pieces with four separate compartments, which are used as compression chambers, as well as for oiling the crank pin bearings on the Model 36 motors, but for oiling purposes only on the Model 46 motors. The cylinders are also lubricated by the special Elmore system, the oil being forced into the intake pipe by a mechanical oiler, a method which insures that all cylinders are lubricated alike.

The cooling water is circulated by thermo-siphon action, and the cooling system comprises a belt driven fan and a tubular radiator. Ignition is by the Atwater Kent generator. The clutch is of the expanding ring type, being bronze to iron; the bracket carrying the expanding member running on annular ball bearings. This is the same clutch that has been used heretofore, except that improvements have

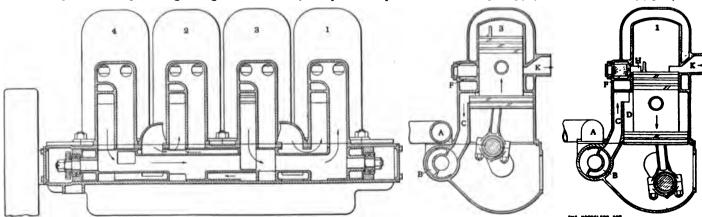

been made, making it self adjusting, self aligning, and automatically self slowing when thrown out. The clutch releasing yoke is equipped with rollers, thereby reducing the wearing surfaces. The transmission is the same as used formerly, that is, a three speed forward selective type, except that on Model 36 a vertical type is used, and on Model 46 a horizontal. The main drive shaft and countershaft are carried on annular ball bearings, and the whole contained in an oil tight aluminum case.

The propeller shaft is provided with two universal joints, the rear one being fitted to the squared end of the main drive bevel pinion shaft. The pinion is keyed to a taper bearing on the opposite end of this shaft and held in place by a lock nut. This bevel pinion shaft is mounted on two New Departure ball bearings. These hold the shaft securely in line at all times with the driven bevel gear. The differential, which is of the bevel gear type, is also carried on two ball bearings which are counterparts of those mentioned above.

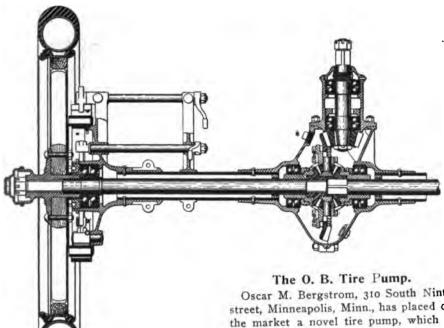

The rear axle, while it is of the same floating type, differs from most others of this type in that it does not require the total tearing down of the rear axle to remove the differential. The live axle shafts are not held in place by lock nuts inside the differential bevel gears, but instead are squared and slip into the differential gears. The shafts are held from working out endwise by a shoulder next to the outer ball bearing, which is also of the New Departure type and designed to take end thrust as well as radial load. The bearing in turn is held in place by an adjusting nut. The outer or wheel end of the live shaft is also squared and fits into the squared hub barrel with a lock nut outside.

The front axle is a single piece I section drop forging, with spring pads forged integral. The knuckle pins are hardened and ground, and fitted with force feed grease cups. The tie rod between the two steering knuckles is placed back of and protected by the front axle.

The wheels are twelve spoke, both front and rear, with the front carried on annular ball bearings. The tire equipment on Model 36 is 34x4 inches; on Model 46, 36x4 inches.

ELMORE HIGH "DUTY" Two Cycle Motor.

SECTIONAL VIEW OF REAR AXLE (ELMORE).

The steering wheel is 18 inches in diameter, and the spark and throttle levers are located on a stationary quadrant on top. The steering gear consists of a bevel gear and pinion.

The frame is cold pressed nickel steel of channel section, inswept in front to assist in short turning, and dropped at the rear, to give a lower centre of gravity. The speed control lever and emergency brake lever are set at a comfortable angle to insure ease in operation. The brake pedal and clutch pedal are of the sickle type, giving great leverage and thereby making operation easy. There are two sets of brakes, both operating on the 16 inch rear wheel brake drums, and working through equalizers, thus reducing the possibility of skidding. The internal brakes are the emergency, and operated by hand lever at the driver's right, the service brakes are the external ones, and are operated by pedal.

The gasoline tank is located under the front seat and holds 15 gallons, while the lubricator holds 5 pints of oil. The springs in front are semi-elliptic, 42 inches long, with three-quarter elliptic scroll, 52 inches long, in the rear. The wheel base of Model 36 is 110 inches, and that of Model 46 120 inches.

The torque is taken on a pressed steel spring cushioned rod. All brake cables are carried through to the inside of the frame, leaving the outside entirely clean. All cars are equipped with two gas headlights, generator, two oil side lamps, one oil tail lamp, horn, muslin cover, tool kit with special wrenches, wheel puller and jack. The weights are given as 2,400 pounds for Model 36, and 2,800 pounds for Model 46.

Oscar M. Bergstrom, 310 South Ninth street, Minneapolis, Minn., has placed on the market a novel tire pump, which is attached to the hub of one of the road wheels and operated by the motor while the wheel is jacked up, by holding it from rotation by means of an anchor chain. The pump is exceedingly simple for a two cylinder pump, a good many parts having been saved by special construction. A double piston is employed, which permits of doing away with one connecting rod and one wrist pin, and there is only one bearing for the whole crank. Aside from the two valves there are only three moving parts, the double piston, the connecting rod and the crank. The double piston arrangement possesses the advantage that it gives a very long bearing on the cylinder walls, thus reducing the friction when pumping against high pressure.

Instead of the ordinary crank shaft a disc is used which is provided on one side with four adjustable, leather faced jaws for attaching the pump to the hub, and the other side of the disc forms one race of an annular ball bearing, the other race of which is integral with the cylinder casting. In the annular ball bearing mentioned to inch balls are used. The pistons are fitted with two rings at each end. These rings are first turned eccentric, then split and reground to perfect size on three sides, to insure a perfect fit. Between the two ring grooves an oil groove is turned in the piston to insure perfect oiling of the cylinders. The main bearing is packed in grease, and one oiling of the pump is claimed to last for a long time.

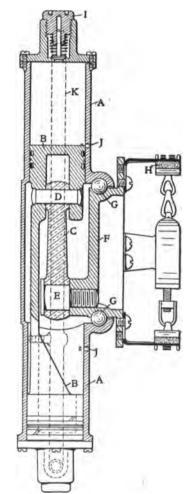

The discharge valves of the pump are of the same construction as the exhaust valves on gasoline motors, and before being assembled are tested to 200 pounds pressure, to insure against leaks. It has been found that the greatest care must be exercised in grinding the valves in order to make them perfectly airtight at high pressure. The air is admitted to the cylinders through port holes in the cylin-

der walls at the end of the suction stroke, these port holes being covered with fine mesh wire screens to exclude dust and dirt

After the double piston is assembled with the cylinder it is moved to one extremity of the stroke, and the outer end of that cylinder is then turned flush with the end of the piston; in fact, a cut is taken over both the piston head and the end of the cylinders at the same time, whereby it is insured that absolutely no dead space is left in the end of the cylinder, and the same operation is then repeated for the end of the other cylinder.

This pump is designed primarily to be operated from the rear hub of the car, but it can also be fitted to be operated from the motor of any exposed shaft, or it may be driven through spur or bevel gears, chain or belt. The inventor, however, thinks that the average owner would prefer to use the rear wheel for driving the pump, as there would always be some additional expense in fitting the pump for driving it from the motor or any other part, unless the manufacturers of cars make special provisions for it.

Practical tests with this pump are said

O. B. Auto Power Pump.

A A, pump cylinder; B B, double piston; C, connecting rod; D, piston pin; E, crank pin; F, crank disc; G, annular ball bearing; H, friction clamp for fastening pump to wheel hub; I, delivery valve fitting; J J, inlet valve ports; K, delivery pipe.

O. B. TIRE PUMP.

to have shown that a flat 34x4 inch tire can be fully inflated in one minute, including the time required for taking the pump from the tool box and placing it there again. At a speed of 200 r. p. m. the pump will fully inflate such a tire in 40 seconds, and other sizes in proportion, and it may be run as high as 300 revolutions. The compressed air delivered by the pump may also be used for cleaning cushions and machinery, and for this purpose a special concentrating air nozzle is used.

The weight of the pump complete is 8 pounds, and it is regularly supplied with 12½ feet of hose, with a hose connector

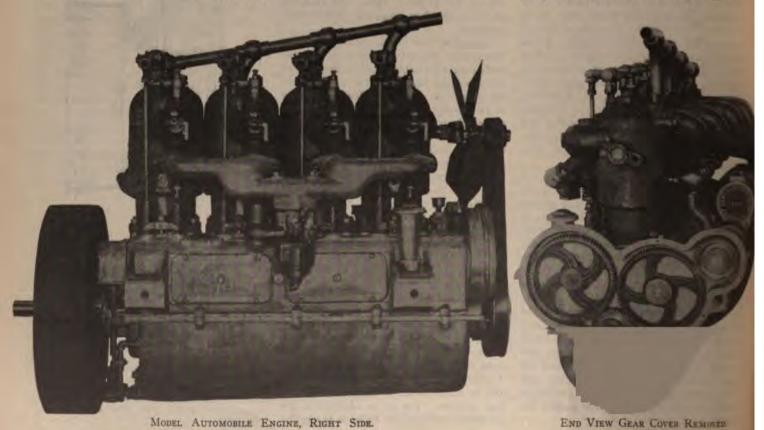

at the free end, as shown in the illustration. The pump is said to be made from the best of materials and to embody high class workmanship. All pumps are shipped to fit one size hub, but they can be easily fitted to any size hub over 3 inches in diameter by simply moving the four leather faced jaws in or out, and shortening or lengthening the binding chain. After the adjustment is once made for a particular size of hub no further adjustment is necessary. Two screw hooks are furnished with each pump, which are screwed into the rear ends of the two running boards respectively, and left there permanently. When it is desired to inflate the tires the pump is placed over the hub and locked there by tightening the adjusting screw on the tightening chain. Then the anchor chain is placed over the screw hook, the motor is started up, the rear wheel to which the pump is attached is jacked up, the high gear is engaged, and the clutch let in.

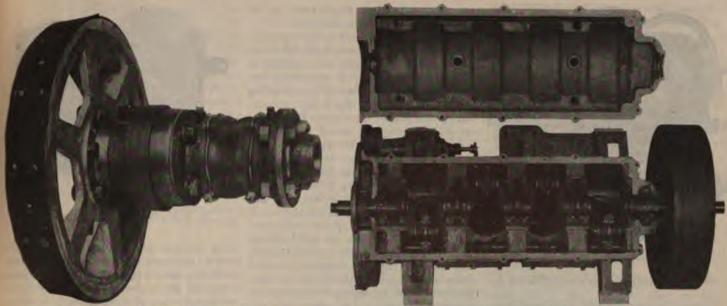

The Jewel Carriage Company, of Cincinnati, Ohio, inform us that the models which they had on exhibition at the Atlanta Show were exhibited in the name of the Ohio Motor Car Company, the automobile end of what was formerly the Jewel Carriage Company. The bore and stroke of this motor are 4½ inches each, and not 4¼ inches, as stated in our report, and the company say that they do not claim 40 horse power for the car, but 35 to 40. The wheel base is 110 inches, instead of 115 inches. They also make another model, which is known as 40A and has a bore of 4¼ inches and a stroke of 4¾ inches.

#### Model Gas Engine Auto Power Plants.

The Model Gas Engine Works, of Peru, Ind., are building this season five different sizes of automobile engines, combined with clutches and double universal joints. All of the engines are four cylinder, and the cylinder sizes are as follows: 4x5 inches (30 horse power), 41/4x5 inches (35 horse power), 41/2x51/2 inches (40 horse power). 5x51/2 inches (50 horse power), 5x6 = (55 horse power). The arrangement of the valves-exhaust valve in the head and btake valve in a side pocket-as well as operation through a single cam shaft remains the same as formerly. The former practice of using an I section in the construction of the crank case, with steel rolrunning clear through, one end of which supports the cylinders, while the other bolds the adjacent crank shaft bearing caps, thus relieving the crank case of the working stresses, has also been retained. The piston heads are made convex as formerly, and the cylinder heads are finished on the inside to eliminate trouble from carbon deposits. Following are some of the most important changes for the coming season:

A self contained oiling system has been adopted of approximately 2 gallons capacity, making it possible to run from 600 to 800 miles without adding lubricating oil. The cam gears are enclosed in an oil tight compartment to eliminate noise. An idler pinion has been inserted between the crank shaft pinion and the pump gear, thus getting the drive of both the pump and magneto away from the cam shaft gear. The pump and magneto are now set on opposite

CLUTCH AND DOUBLE UNIVERSAL JOINT.

BOTTOM VIEW OF ENGINE-LOWER CRANK CASE REMOVED.

sides of the motor in such positions that both can be removed quickly without interfering with other parts. Flexible couplings are inserted between the pump and magneto and their respective driving gears.

The lower part of the crank case is so arranged that it acts only as an oil reservoir and a cover, and is entirely independent of the bearings, thus making it possible not only to remove the lower half of the casing quickly but to run the motor with all bearings in place and the lower half of the casing removed, thus permitting of readily making any adjustments required. A vent pipe is provided so designed that it acts as a filling cap and makes it impossible for oil to escape.

All bearings are of the genuine nickel Babbitt die cast type. All bearing caps are of manganese bronze into which the die cast bearings are fitted. The cam shaft is a solid forging. The cylinders are bored, reamed and ground. The pistons are all finished except grinding, then annealed so as to prevent change of shape and afterward ground. The piston pins, rocker arms, rocker arm pins, valve lifters and all other parts on which there is any wear are also hardened and ground. The gradual increase of the exhaust pipe as each cylinder leads into it is clearly shown in the photograph, the outlet being approximately four times the area of the exhaust port from each cylinder. Special atention has also been given to the question of accessibility, as may be judged from the illustrations. The motor is said to be very light for the horse power developed, owing largely to the steel rod construction referred to above, yet the bearing surfaces are claimed to be large, and this, together with the five bearing shaft, is claimed to insure a motor of long

The clutch is of the cone type, covered with Raybestos (six engaging springs being placed under the Raybestos to insure smooth working of the clutch), and is equipped with ball bearing release collar. It has a flange connection for the double universal joint. The universal joints are of the well known slot and trunnion type, with all parts hardened and ground, and is protected by a boot.

#### Gilliam Engine Hood Cover.

One common annoyance attendant upon the operation of an automobile during the winter is the difficulty experienced in starting the motor after it has stood idle in the cold for any considerable length of time. Exposure to a low temperature chills the cylinders, the intake piping and the carburetor to such a degree that an explosive mixture can only be secured after considerable labor at the crank, and sometimes only after the cylinders have been primed. So long as the motor and its auxiliaries are kept warm starting is readily performed, and many operators make a practice of throwing a robe over the hood and radiator when the engine is stopped, thus confining the heat so that cooling shall be retarded as much as possible, and so that the motor and intake pipes shall be reasonably warm even after a stop of considerable duration. This is, however,

THE GILLIAM ENGINE HOOD COVER.

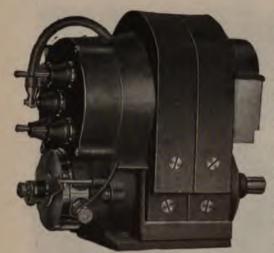

rather a crude and not entirely satisfactory expedient.

In order to retain the heat of the motor in an effective manner the Gilliam Manufacturing Company, Canton, Ohio, has brought out the Gilliam engine hood cover. This consists of a lined, heat insulating fabric covering, so arranged as to fit closely over the entire bonnet and radiator front of any make of car. Three qualities are made, the materials used being, respectively, as follows: Waterproof rubber drill, lined with heavy wool felt; pantasote, with the same non-conductive lining of wool felt, and genuine hand buffed grain leather, with wool felt lining.

As soon as the motor is stopped the hood cover is put into place, and radiation and convection of engine heat are thereby greatly reduced. The cover may be used as a lap robe or driver's storm cape while the car is running, and in case repairs become necessary it may be used for the mechanician to lie or kneel upon.

#### Pfanstiehl Magneto.

The Pfanstiehl Electrical Laboratory, of North Chicago, Ill., have placed on the market a new magneto of the lowhigh tension type, in which a low tension current is generated in the armature, which is transformed into a high tension current by a stationary induction coil. The chief point of difference between this and other magnetos of the same type is that the induction coil is built into the magneto, being located in the hollow of the permanent magnets, above the armature. The manufacturers recommend the use of the magneto in connection with a complete auxiliary battery system, using two sets of spark plugs, so that no matter what may happen to one system the other will not be affected. The company have had con-

PEANSTIEHL MAGNETO.

siderable experience in manufacturing ignition coils, and the coil of the magneto is manufactured by the same methods as their regular coils and is guaranteed for five years against breakdown. The high tension windings are sealed up in a watertight case.

The magneto is provided with liberal bearing surfaces and has provision for holding a considerable quantity of oil, so that it is not necessary to give it frequent attention in this respect. It is claimed to generate a spark at a very low speed of rotation, and to afford a wide range of spark advance. When the magneto is used in combination with a battery system, a kick-switch is fixed to the battery coil by means of which it is possible to change from battery to magneto and vice versa.

#### The Ever Ready Taximeter.

The Auto Improvement Company, 316 Hudson street, New York, have recently added a taximeter to their well known line of accessories. The machine contains a number of novel features, and a careful examination shows that considerable thought has been put into the design to render the instrument strong and durable. The casing is a single carring with both front and rear covers litted so as to break joints and render it both dust and water proof. The mechanism is driven by a worm about 8 inches in diameter, which drives a four toothed star wheel on the end of the flexible shaft. This shaft makes about 160 turns to the mile with the average taxicab wheel, or about forty revolutions per minute. This comparatively slow movement reduces the wear and strain on the flexible shaft, and the comparatively large diameter of the worm gives a high peripheral speed which makes it to a certain extent self cleaning by virtue of centrifugal force.

The most novel feature of the machine itself is probably the fact that restoring the flag to the disengaged position does not set back the fare indicating wheels to zero, the full amount of the last fare remaining on the dials until the flag is pulled to the engaged position for the next fare.

A spring latch is fitted to the flag which must be pulled out before it can be moved from either the engaged, non-recording or vacant position to any of the others. The back of the machine contains five recording dials for the use of the owner or company. The first of these shows the amount of initial fares, the second that of the extras, and the third the amount due for mileage and waiting time in excess of the initial fares. All of these dials read in dollars and cents. In order to find the number of trips that the machine has made during the day the amount of initial fares is divided by the amount of the initial fare. The fourth dial shows the total mileage covered by the machine in miles and tenths. and the fifth the total recorded or "live" miles in miles and tenths. Both the clock key and the key for setting the "extras" are secured to the machine; in other words, the machine is stem winding. Special attention has been given to the securing and sealing of all parts, to make the machine as water, dust and fool proof as possible.

#### U. & H. High Tension Switch.

In connection with the latest type U. & H. Master magneto, intended for dual ignition, which are imported by the J. S. Bretz Company, Times Building, New York, an improved form of high tension switch, which is mounted integral with the coil box, is furnished. The high tension switch has been one of the most trouble-

EVER READY TAXIMETER.

U. & H. HIGH TENSION SWITCH.

some features of the dual system of ignition, owing to the difficulty of securing sufficient insulating surface between the contacts. By mounting the switch directly in the coil box, a construction is said to be obtained, whereby the requisite amount of insulating material can be employed without making the device cumbersome and unsightly.

With this magneto, practically two systems of ignition are secured, both systems operating through the same set of spark plugs, thus avoiding the fouling of the idle set where two separate systems are employed. The battery timer is incorporated directly within the magneto, and is an integral part of same. The coil, which is located on the dash, is in use only when the battery system of ignition is being employed.

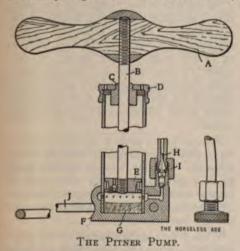

#### The Pitner Automobile Pump.

D. H. Lawrence Company, Sterling, Ill., manufacture a hand pump for inflating automobile tires, which is claimed to be of particularly substantial and durable construction. A sectional view of the pump, with the middle portion of the pump barrel cut away, is shown herewith. The general arrangement of the pump is conventional, but the details have all been well worked out. The wood handle A is made of selected, seasoned hardwood and driven into a brass collar. Then a hole is drilled through one side of the brass collar and the wood, and a thread is cut through the lower side of the brass collar and slightly into the wood. The top end of the piston rod B, which is cut with a thread for a length of 13% inch, is screwed into this hole, cutting its own thread in that portion of the wood which has not been tapped. It is claimed that the handle cannot come loose or split in use.

The piston rod is guided in a hardened steel bearing C, which is securely threaded into the pump cap D, which latter is machined out of solid rod brass. The piston E of the pump consists of a solid rod brass disc, which is securely screwed to the piston rod. The outside diameter of the piston is 0.004 inch less than the bore of the barrel. A thick leather strip is located in a groove

cut in the outside surface of the piston disc, and serves as a packing ring. The leather strip does not quite fill the groove, but leaves an empty space underneath it, which space communicates through four air passages with the compression chamber, so that as the piston is forced down the compression in the chamber forces the packing ring outward against the wall of the barrel. The pressure of the packing ring against the barrel wall is, therefore, always in direct proportion to the pressure beneath the piston, and is released instantly on the upward stroke. A ball check valve is located in the piston for transferring the air to the lower part of the barrel. The pump barrel is made of 14 gauge cold drawn seamless

The lower end of the pump barrel is set into a brass base F, and is securely soldered or sweated. There is an interior circumferential groove in the base which becomes a circular passage when the base is attached,

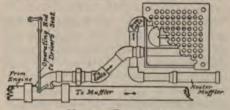

and there are twenty little holes through the wall of the barrel, spaced evenly around the circumference, whereby the compression chamber is placed in communication with a circular chamber in the base communicating with the outlet opening. A thick felt disc G is placed at the bottom of the pump barrel, filling it to within a short distance of the twenty holes in the wall. This felt serves for retaining lubricating oil. As soon as the piston on its downward stroke closes the holes in the wall of the barrel an air cushion is formed which makes it impossible to bump the piston against the bottom of the pump with any force.

A special hose connection is used for connecting the hose to the pump. A small hollow metal part H, referred to as the hose wedge, is forced into the end of the hose, expanding it, and a coupling nut I is then drawn tight on the connection piece of the base, forcing the conical head of the hose wedge against the conical seat in the connecting piece. A ball check is provided at this point, and a small slot is made in the head of the hose wedge to prevent the ball from closing the opening in the wedge. The pump is provided with a hinged foot piece J, which folds up to the pump barrel when the pump is not in use.

#### American Auto Heater.

The American auto heater marketed by Flavius G. W. Sudrow, of Buffalo, N. Y., is designed to promote the comfort of automobile users during the cold and chilly months. It comprises a T connection inserted into the exhaust line ahead of the

HEATER COMPLETE.

muffler. In this T is a butterfly valve which regulates the amount of exhaust directed through the heater coils. A portion of the tonneau floor is removed and a register inserted, directly underneath which are the coils of the heater. At the outlet end of the coils is a small muffler which allows a free circulation of the exhaust gases through the coils, but prevents any noise therefrom. The amount of heat can be regulated from the driver's seat.

#### Binks Compound Air Pump.

The Star Brass Works, of Chicago, Ill., have brought out an improved model of their Binks compound air pump. The pump can be used either for portable or stationary purposes. It has been changed from their former model in that the cylinders are now placed side by side instead of tandem as before. This latter arrangement is claimed to add greatly to the ease of operation, since a different leverage can be obtained for the separate cylinders. Another step in the direction of easy operation is the use of large roller bearings in the loops of the plunger rods. The cylinders are of seamless brass tubing. The large cylinder measures 4x51/2 inches, and the small cylinder 21/2x5 inches.

On the forward stroke the air is forced into the high pressure cylinder, and on the return stroke it is compressed into the tire. The pump is fitted with three valves, one valve preventing air from returning to the pump after being discharged. The valves,

BINKS COMPOUND PUMP

plunger rods and all connections are of brass, but the frame and its parts are of iron, and enamelled.

#### Cameron Automobile Cranes.

The Cameron Engineering Company, of Brooklyn, N. Y., are producing a very complete line of portable cranes and trolleys, especially adapted for use in manufacturing and repairing automobiles. The portable cranes are made in five sizes, from one-half ton up to and including 3 tons. They are constructed of channel steel with four small truck wheels, which are so arranged that in turning corners the front or guiding wheels will not cramp and stick. Any style, chain block, hoist, may be used from the single to the triplex. The I ton crane is perhaps most applicable to ordinary automobile work, and has a lift of 7 feet 4 inches with the triplex block. The crane is

PORTABLE PULLEY BLOCK CRANE.

so designed that it can be backed in between the wheels of an auto to remove the motor or other members of the car.

Their trolleys are specially adapted to large factories where many cars are being constructed, as by suspending an I beam above the chassis assembling floor and using the trolley a chassis when completed can be picked up and carried out of the way by one man and without interfering with the other workmen. The trolley has four flanged wheels, which are carried on ball bearings and set at the proper angle to insure full bearing on the surface of the I beam. The trolley tramways can be provided with turntables and switches so as to cover every part of the factory. The turntable is a short I beam supported from above, carried on rollers which in turn. are carried in a steel angle circle with the flat flange turned into the centre.

# COMMENTS AND QUERIES OF READERS.

#### Air Cooling Two Cycle Motors.

Editor Horseless Age:

There seems to be a few points in relation to the two cycle engine which should not be overlooked in connection with Mr. Clough's able article on "Air versus Water Cooling." I believe the two cycle engine has a very great future for auto work, and on this account it should not be neglected. It has no valves nor valve jackets, so there can be no valve pitting, and since the cylinder heads are symmetrical they can be machined inside and out and be quite certain to expand and contract without distortion. On these accounts the second "end" mentioned by Mr. C. is hardly applicable to the two cycle, especially if of the air cooled type.

The fourth "end" also hardly applies because the new charge is not drawn into a hot cylinder through hot valves, but into a relatively cool crank case. Once in this case every bit of heat it absorbs increases its pressure and certainty of quick transference and increases rather than decreases the size of the transferred charge.

This leaves only ends one and three to be sought for in the well made two cycle engine. Lubricating oils can be had with flash temperatures well up to 700° Fahr., so there need be little thought given the cooling problem if proper oil is used and lubrication the only requirement

lubrication the only requirement.

The third "end," prevention, not of self-ignition, for this is not objectionable, but of preignition, by which I mean selfignition so early as to result in back pressure and loss of power, is in this type of engine the great desideratum. Preignition may result from excessively heated walls, high compression, over-fat mixture, hot carbon particles left by excessive lubrication or by faulty design of motor, which may have parts not properly cooled. In a well designed motor the first and last of these should not exist. Carbon deposits should not be formed, but if formed should be cleaned out, by scraping if necessary.

The one ever-present cause of heat troubles is the quality of the mixture, particularly in conjunction with the compression. In general the lower the compression the hotter the walls may be, or with a constant wall temperature the fatter the mixture may be. There seems to be exceptions to this statement, due to causes not necessary to include here; but the point is that preignition can often be prevented by adjusting the mixture. Hot walls and lean mixtures are conducive to great economy, and because of this fact a low compression engine with hot walls may be more economical than one of

higher compression with colder walls. All of these things favor the air cooled two cycle engine.

The only fly in the ointment is the fact that the average user judges his motor by its maximum performance rather than by its average. He may not need its maximum capacity but a few times per year, and if wise will be satisfied to drive a little slower, take the low gear a little sooner, or even ignore a little pounding on these few occasions rather than avoid them by increased complication and general lowered economy.

CHAS. E. DURYEA.

#### Rejuvenating Old Dry Cells.

Editor Horseless Age:

In the Scientific American of October 23 is a short article by Dr. E. M. Hanson, in which he states very positively that old dry cells may be rejuvenated as follows: Midway between carbon and zinc hore a & inch hole to within 11/4 inches of the bottom. On the opposite side of the carbon bore a he inch hole 3 inches deep. In the larger hole pour I ounce c. p. hydrochloric acid. and follow with I ounce water. Seal with stationers' sealing wax. Being interested we tried it. After the liquids were in (which, by the way, took forty-eight hours) the cells tested by ammeter between 3 and 4, but the next day they had dropped back to I, where they remained at last accounts. I would like to know if anyone has tried this plan with any better success.

We have tried various methods before, but always without success, and I would like to ask if it is possible to bring a dead cell up to a working amperage.

JOHN J. SHAW.

# Magneto Ignition of Motors at Slow Speed.

Editor Horseless Age:

As a footnote to my contribution on this subject, page 501 of your issue of November 3, 1909, you say: "We would like to know what Mr. Hess means by 'a spark of full value.' He certainly cannot mean that his magneto will generate as large a spark at 35 r. p. m. as it will at any higher speed of revolution. Are we to understand that at 35 r. p. m. the magneto will generate a spark of sufficient volume to ignite a charge just at the limit of ignitibility; that is to say, a charge so poorly dosed and so much contaminated with spent gases that it is barely possible to ignite it by the most powerful spark?"

To answer your question absolutely would be necessary to know what you have in mind by a large spark. I did not refer to a large spark: I did refer, and as you quote me, to "a spark of full value." By full value I mean a spark that will ignite such a mixture as is apt to be present when a motor is running at its slowest speed. If the mixture is so poor or so rich that it is not ignitible then no spark will ignite it. The main point is that the magneto that I refer to, which is the one my company is now handling, will give a spark that will ignite a proper gasoline mixture at as low a speed as 35 r. p. m. I believe that I am correct, and I know that I am correct so far as the actual testing out of a considerable number of magnetos of various makes is concerned; that this ability to give a spark having ignition power, or even any spark, even in air, at so low a speed as 35 r. p. m., is found in no other

As the editor has brought up the question, I should like to have a few words to say concerning sparking in general. Every automobilist is familiar with such phrases as "a fat spark," "a hot spark," "a cold spark," "a large spark," etc. Possibly these mean something to someone, but it is apparently the fact that there is no actual definition of the real meaning of these various terms.

This confusion could be avoided if terms were used that referred to absolute measurements. Possibly the most valuable quality of a spark is that which can be defined by the amount of heat energy it contains. That heat energy is rather difficult of measurement by ordinary means.

When I took up this matter of the magneto I was met at the outset with this confusion of terms and definitions of sparks. I therefore first tried to procure instruments which would allow me to measure the heat energy of a spark. Being unsuccessful in that I devised an apparatus which was shown at last winter's shows in New York. Briefly, that apparatus consisted of a small vial or tube into which two wires, having a proper spark gap, were sealed hermetically. This tube was enclosed in a second rather larger one containing a definite quantity of water at a known temperature. Into this water there was inserted also a bulb and the lower end of a sensitive thermometer; the whole was then enclosed in a specially made Thermos bottle. The two terminals were then connected to the magneto in the same way that a spark plug would be connected. The magneto was then run at a low speed for a certain definite time, and the heat delivered to the water was read from the thermometer. The same test was then repeated with the magneto running at a different speed. A full series of such tests was made at various speeds, ranging from 35 r. p. m. up to 2,800 r. p. m. of the magneto. Each test occupied ten minutes continuous running.

As at the beginning of each test the water was of the same quantity and at the same

temperature, the thermometer gave comparable readings. The influence of radiation from the surface of the apparatus was reduced to an entirely negligible amount, since the Thermos bottle in which the whole was enclosed guarded against any appreciable loss of heat to the surrounding atmosphere during the period of a test. It follows that readings of the thermometers were in direct ratio with the total heat energy.

A series of seven of the best known European and American magnetos were tested out in this way among others.

As it is well known that sparking under pressure is more difficult than in the open air, a small tank was constructed having a plate glass front and having four spark plugs in the back. This tank was then charged with compressed air and the magneto connected to these four spark plugs. The speeds at which a magneto would give sparks in this tank were noted, and various magnetos compared in this respect also. The precaution was taken to calibrate the plugs among one another before actual readings were made. This was done because it was found that spark plugs had very great variations even when the spark gaps seemed to be alike. Out of a very large number of plugs tested, all of one make, only a small percentage were found HENRY HESS. to be at all alike.

#### "Flying Piston" Explained.

Editor Horseless Age:

Say to your correspondent, "H. F. B.," that a "flying piston" usually means the device used in gas engines of the early '70s, wherein the cylinder stood vertically and the explosion shot the piston upward against gravity. This arrangement permitted high piston speed during the expansion of the gases. The exhaust escaped while the piston was highest. In falling a rack and pinion with a ratchet caused the weight of the piston to turn the shaft. In later years the term "free piston" was used, and the motors were built two cylinder, two cycle, cylinders being opposed and the pistons not restrained to a definite stroke by a crank shaft. An explosion in one cylinder drove the pistons toward the other firing chamber until stopped by the compression therein. The higher the speed the higher the compression. As soon as the cylinders warm up the compression pressures suffice to ignite the charges, and there is practically no such thing as preignition, because the pistons are free to go back whenever the pressure is sufficient to reverse them. Power is taken off by a double acting ratchet lever attached at the centre of the piston rod. This engine is not only of very high efficiency, due to the high compressions which permit the use of lean fuel mixtures, but it is interesting just at present because, having no crank shaft, autos propelled by it are not within the scope of a recent CHAS. E. DURYEA. patent decision.

#### Differential on Propeller Shaft.

Editor Horseless Age:

Some time during the last few years some of the technical papers published a description of an axle used in one of the foreign cars with the differential on the propeller shaft, splitting the driving pinion in two parts, and compensating between the two parts. Can you give us an idea where we can find anything in the way of printed matter and drawings on this subject? The writer is familiar with the axles as found in this country.

D. E. R.

[Constructions in which the differential gear is placed on the propeller shaft or an extension of the propeller shaft are used in a number of European cars. Notable among these is the Mercedes shaft driven town car. The arrangement of the drive of this car was described in THE Horse-LESS AGE for September 2, 1908, page 290. The differential is located in its usual position at the centre of the rear wheel, but instead of having its axis parallel with the axis of the rear axle, has it at right angles thereto. The side gears of the differential connect with bevel pinions of unequal size, which mesh with bevel gears of corresponding size on the inner ends of the two rear axle shafts respectively. A similar construction is used by La Buire, which was described in THE HORSELESS AGE, February 20, 1907, page 263. A slight variation from this is used by the Fiat Company in their town car. In this the two bevel driving pinions are of the same size, as are also the two driven bevel gears, and to obviate interference of the pinion meshing with one gear, with the other gear, the propeller shaft carrying the differential is placed so as to make less than a right angle with the rear axle. This arrangement was illustrated and described in THE HORSE-LESS AGE of August 21, 1907, page 241.—ED.]

# Australian Patent Applications Under the International Convention.

Editor Horseless Age:

Under new regulations which went into operation on August 5 last, American, British and foreign applicants for Australian patents, to avail themselves of the International Convention arrangements, must file at the time of deposit of their application papers the usual certified copy of specifications and drawings and certificate of identity. This certified replica may be of the American, British or foreign application as filed or as allowed if it has reached that stage. Should such documents be in a foreign language a declared translated copy must be attached.

An extension of time of three months may be obtained in which to file the said certified copy, but application for such extension must be made at the time of filing. The Government fees for the extension amount to £2 for one month, £4 for two months and £6 for the limit of three months

PHILLIPS, ORMONDE & Co., Melbourne, Australia.

#### Quieting Noisy Gears.

Editor Horseless Age:

Can you suggest a practical method of eliminating or reducing the rattling noise in the planetary transmission of a two cylinder car, outside of replacing the gears? The rattle is doubtless caused principally on account of defective design, as the planetary transmission in other makes of machines works even quieter, even after considerable use. Possibly some of the owners of this model have been successful in remedying the fault and could suggest a remedy of the trouble.

S. H. Johnson.

[We would suggest that you try the use of boxwood sawdust and heavy grease in the gear, which has been found effective in quieting noisy clash gears. The sawdust is also known as jeweler's sawdust. The most certain way to render the gear fairly quiet, however, would be to provide new pinions.—Ep.1

#### Horse Power Tests.

Editor Horseless Age:

Last week I saw a brake test taken on a four cylinder, four cycle automobile motor of 4 inch bore and 4 inch stroke. The brake arm was 4 feet long, and a load of 25 pounds was balanced. The speed taken was 1,400 r. p. m.. The brake was tightened so as to balance 35 pounds, but the engine stopped before the lever was moved, and another trial with 30 pounds showed that the lever hardly was moved before the engine stopped again. The engine runs free without any load up to very nearly 2,000 r. p. m. Now, if you figure the b. h. p. you will get about 22. Do you call an engine like this a 22 b. h. p. engine?

Another test was made with a load of 20 pounds, and it was found that the speed was the same, 1,400 r. p. m. What should be the pull on the scale, and at what speed, to get what could be called a 30 b. h. p. engine? It looks like a foolish question, but you see I do not call the engine of which I have given you the test a 22 b. h. p. engine, and still it does figure out to this horse power. I think an automobile engine of 22 b. h. p. should pull 35 pounds if only at 600 r. p. m., but this we have to expect from a heavy duty engine. An engine like the above will be all right on good roads, but how will it be for hill climbing?

J. G. A.

[The brake arrangement used in the tests described by you was apparently of a rather crude nature. In using such a brake you must first balance it by means of a counterweight around the centre of the brake drum, otherwise the unbalanced weight of the brake arm will affect the result. To

show 22 horse power at 1,400 r. p. m. the pull or weight at the end of a 4 foot brake arm must be

$$\frac{22 \times 33000}{4 \times 2 \times 3.14 \times 1400} = 20.4 \text{ pounds.}$$

Of course, at lower speeds the pull corresponding to the same horse power is correspondingly greater. For instance, at half the speed, or 700 r. p. m., a pull of 40.8 pounds would be required at the end of a 4 foot beam to indicate 22 horse power, but, of course, if a motor develops a certain horse power at one particular speed the maker is justified in rating his motor at that horse power. No gasoline motor gives the same horse power through a large range of speed. Your test data contain no information enabling us to judge the special adaptability of your motor to commercial vehicle service.

The necessary weight or pull at the end of a 4 foot arm to show 30 horse power is 39.4 pounds at 1,000 r. p. m., 33 pounds at 1,200 r. p. m.,—Ep.]

# "Calculation of Chassis Springs." Editor Horseless Age:

I have been very much interested in the contribution by Messrs. Landau and Golden, but fail to see how they can make out an accurate spring specification on flexibility and oscillation periods only, neglecting the style of suspension. Why do designers incline the spring links? If Messrs. Landau and Golden would only take equation (5) in its entirety instead of substitution b = 0. their experiments for constants would have more value. The writer must confess his inability to see how any accurate data could be verified without taking the angle of the spring links. The proposition is Greek solution. Take a given spring, known deflection, with straight up links, incline them to 45 degrees, and the difference in flexibility is a surprise. This, of course, must be figured in conjunction with the camber of the springs and the length of the links. The beauty of this suspension is its easy riding qualities when "light" and the low stress in the springs for maximum load; in other words, enabling a much stiffer spring to be used for the same flexibility. Again, the writer utterly fails to see any other but "Equation 5, complete," and not the preferred one (7), which is very incomplete and misleading. ARTHUR M. LAYCOCK.

The above communication was submitted to Messrs. Landau and Golden, who reply to it as follows:

Editor Horseless Age:

The remarks of your correspondent, Mr. Laycock, are evidently due to his failure to understand the nature of the problem which we set ourselves to solve. The title of the article, "Calculation of Chassis Springs," clearly indicates what we intended to discuss, and we believe, as you remark, that we have covered this subject quite

thoroughly. Had we intended to take up the question of suspensions we would have been obliged to consider such matters as the angle of the links, the form and arrangement of the spring brackets, hangers, etc.

The matter of the inclination of the links is, therefore, entirely foreign to the subject, but we can say that it does not cut much of a figure provided we make the spring flexible enough in the first place. If your correspondent has experimented with straight up and inclined links, and found a marked improvement in the riding qualities, the springs on which he made his experiments were without question too stiff in the first place. The use of inclined links is one way of correcting a bad spring. The average spring maker has another way. He never suggests to his customer the use of inclined links. He first makes a spring according to the blue print, employing the number and thickness of leaves which his experience dictates to be about right. The spring is then sent to the customer to be "tried out," and is usually found to be too soft or too hard. The spring maker is so informed, and he immediately proceeds to apply some more of his experience. After making from two to four applications of this experience, the customer gets a spring which is about right so far as the flexibility is concerned. In our article we indicate a method of getting the desired result at the first crack.

Your correspondent advises that inclined links enable us to use a stiffer spring for the same flexibility, thereby cutting down the stresses under the maximum load. Why use a stiffer spring for the same flexibility when a lighter spring will do the work? It has been our experience that engineers try to make their parts as light as possible. The proper and legitimate way to keep down the effect of excessive stresses is not to make the spring stiffer, that is heavier, but to employ a material with a high enough elastic elongation. If Mr. Laycock prefers to make his springs of inferior material and heavier than necessary, we will not try to rob him of the right.

As to equation (7), which your correspondent characterizes as incomplete and misleading, we regret very much that he has jumped at such a rash conclusion without having read the remaining instalments of the article. Our own application of this equation, with excellent results, to a large number of American springs, and the further fact that it is constantly used for the calculation of springs by the Etablissements Lemoine, for whose spring experience we have a sacred regard, lead us to accept it as the most practical. We have checked the flexibilities of several American springs by means of this formula, and have got more accurate results than the spring maker is able to measure with an ordinary rule graduated in sixty-fourths of DAVID LANDAU. an inch.

ASHER GOLDEN.

Calculation of Compression Space.

Editor Horseless Age:

I am a reader of your paper and have read a number of articles on compression in gasoline motors, but have so far been unable to get just what I want. I would therefore ask for a little information through your columns. I would like to find the necessary compression space of a 4½ bore by 4¾ stroke motor, with valves 2¼ diameter and mechanically operated, to secure a compression 80 pounds per square inch. Is this what is generally used by manufacturers? Kindly supply any of the necessary data that I have not given in order that I may understand it clearly.

P. E. GRACE

[A compression of 80 pounds per square inch gauge is probably somewhat above the average, and 70 pounds would probably be nearer to the mark. The ratio of the necessary compression volume to the piston displacement volume for any given compression is best found from a compression curve, as has been published in The Horse-Less Age repeatedly. From this curve we find that the ratio is 32 per cent. for 80 pounds and 36 per cent. for 70 pounds. The piston displacement volume of your motor is 4.5x4.5x0.785x4.75=75.5 cubic inches. 32 per cent. of this is 24.15 cubic inches and 36 per cent. 27.18 cubic inches.—Ed.]

#### Head Lamp Sizes.

Editor Horseless Age:

In your issue of November 10 on page 537, in reference to the inquiry for suitable size of electric vehicle lamps, we would like to suggest that you advise your inquirer that the 20 c. p. electric lamp will give a much more powerful light on the road than the 37 candle acetylene light, for the reason that the parabolic reflector used with electric lamps will project a great deal more of the light forward than will the saucer shaped reflector used with acetylene gas. We have installed a large number of electric lighting systems on automobiles, and we find that with our 20 c. p. electric headlights we have a much more powerful light than the best of the acetylene type.

> APPLE ELECTRIC COMPANY, V. T. Apple, Mgr.

#### Organization of Henry Motor Car Company.

Following is the full list of officers of the newly organized Henry Motor Car Company, which will take over the business of the Gary Motor Car Company at Muskegon, Mich.: Wm. L. Simonton, president; Chas. F. Latimer, vice president; T. H. DeMange, secretary; Chas. H. Latimer, treasurer; David W. Henry, general manager. Work is being rushed on the new factory which is being erected for the company near the American Electric Fuse Company's factory, and the contracts for the machine tool equipment have been signed. The company will manufacture a \$1,650 car.

### THE FIELD OF COMMERCIAL APPLICATIONS.

Motor Wagons for Italian Army.

It is reported that the general staff of the Italian army, which for some years has been greatly hampered by the scarcity of horses suitable for military service, has decided to make very extensive use of motor trucks in the future. It is said to be planned to ask for an appropriation of 60,-000,000 lire for the purpose. For a beginning bids will be called for on 600 military trucks. No definite specifications have as vet been issued, but it is stated that one light car type with a loading capacity of I to 11/2 tons and one heavy car type with a load capacity of 21/2 tons will be adopted. The operating fuel must be either gasoline, kerosene or alcohol.. The vehicles must be fitted with chain drive, capable of ascending grades of 15 per cent. under full load and carry on board supplies for at least 125 miles. The average speed when loaded must be at least 9.4 miles per hour. After an examination of the bids received, the Ministry of War, before awarding the contracts, will make a trial in order to determine the fuel consumption. It is thought that the invitation for bids will be issued in the very near future.

#### Dispute Over Taxicab Stand.

The New York Taxicab Company last week made an application to Supreme Court Justice Seabury to restrain the New York Taxi-Service Company and the George Rector Company, proprietor of the Café Madrid, from operating a stand in front of that place, claiming that they had a contract with James Churchill, who formerly conducted the café, which still has three and one-half years to run. In the application the annual profits of the stand are estimated at \$20,000, and the loss resulting to the New York Taxicab Company from the revocation of the privilege is estimated at \$70,000. The decision in the case was reserved.

#### Commercial Notes.

Postmaster Eaton, of Duluth, Minn., advocates the purchase of a motor mail wagon for the collection of mails in that city.

The Johnson Auto Company, of Vincennes, Ind., have inaugurated a motor delivery service for local merchants, employing a coupon system.

The operation of the auto line between Thurmont, Md., and Gettysburg, Pa., via Emmittsburg, has been discontinued. A special meeting of the directors and stockholders has been called.

Kenosha, Wis., is the first city in Wisconsin, outside of Milwaukee, to enjoy taxicab service. The Kent Motor Car Company, recently established as an agency and garage, is meeting with success in the ven-

ture and plans to add another cab soon. Kenosha has a population of about 25,000.

The Pacific Manifolding Book Company, San Francisco, Cal., whose salesmen cover the entire State, have decided to provide all of them with Hudson "20" cars, according to a report from San Francisco.

A motor propelled combination hose and chemical wagon is being built for the fire department of Wheeling, W. Va., by the Seagraves Fire Engine Company, of Columbus, Ohio. When accepted it will be stationed in the Atlantic engine house in Wheeling.

W. D. Foil & Co., a livery firm of Mount Pleasant, N. C., have organized a new company to operate a motor service between Mount Pleasant and Concord. A five passenger, 40 horse power car will be used, and two trips will be made per day. The mails, which are now carried by the firm's horse buses, will be carried by the automobiles in future.

#### Grand Prix Prospects.

For the Grand Prix race of the A. C. of France in 1910 the first entries have been received, three cars having been entered by the German Benz firm, two of which are to be driven by Duray and Hemery, respectively, and three by the French Rolland-Pilain firm. The race will be held only if forty-five cars are entered up to November 30. There is at present some talk in Paris that in case the required number of entries should not be received, and the A. C. of France in consequence decide not to hold the race, a syndicate which considers thirty entries entirely sufficient to meet the expenses would conduct the race on the Dieppe circuit in 1910, the Dieppe circuit committee being willing to bear a large proportion of the organizing expenses.

# A. C. of France Protests Against Proposed Taxes.

The Automobile Club of France, in view of the already heavy taxation of motor vehicles of all classes in that country, have adopted resolutions urging the rejection of the proposed new tax on automobiles and the continuation of the present tax; the rejection of the proposed tax on motor boats, and the application of the tax imposed on native owners on automobiles brought into France from other countries after a period of six months; that is, when the owner may be considered a resident of France. Upon the motion of Baron de Zuylen the executive committee decided to investigate the possibility of securing a decrease in the exorbitant duty on gasoline, which is the cause of the high price of 50 centimes per litre in Paris, as compared with 13 centimes in Brussels.

#### Auto Incorporations in Michigan.

Figures given out by the Michigan Secretary of State show the rapid growth of the automobile business in the Wolverine State during the past ten months. From January 1 to November 15, inclusive, thirty-four automobile companies, with a capital of \$15,-423,000, have filed articles of incorporation with the Secretary of State at Lansing. The capital stocks of the companies range from \$8,000 to \$10,000,000. The Packard Motor Car Company, of Detroit, incorporated for \$10,000,000, was the largest concern to file articles this year. In addition to the companies organized for the manufacture of motor vehicles there were fiftyfour companies organized for the production of parts for automobiles. The total capitalization of the parts concerns was \$1,000,000.

#### Private Test of Metz Car.

The Metz Company, of Waltham, Mass, on October 30 put one of their Metz plan cars through a 24 hour endurance run over a five mile course through the streets of Waltham. In 23 hours 45 minutes 460 miles were covered, we are informed, and the car is said to have run throughout the trial with the greatest regularity, the only interruption in the run having been due to a tire puncture, a failure of the gas lamps and the need of carburetor adjustment. During the trial 13½ gallons of gasoline were used and 6½ quarts of oil.

#### Studebaker Branch in Atlanta.

The Studebaker Automobile Company have purchased the interest of G. W. Hansen and his associates in the Georgia Motor Car Company, and papers have been executed for the formation of a Studebaker subsidiary company to conduct a branch in Atlanta, from which will be covered the two Carolinas, Georgia and Florida. Mr. Hansen will continue as manager of the local concern. A new building is being erected at 45 Auburn avenue, in which the company will have a garage and showroom when completed.

#### New Detroit Parts Firm.

The Detroit Steering Wheel and Wind Shield Company was incorporated at Detroit, Mich., a short time ago, with a capital stock of \$100,000, of which \$42,500 has been paid in in cash and \$7,500 in property. The stockholders of the company are: Albert S. Keen, W. H. Hinkle, Howard E. Coffin, Hugh J. Denk, Titus Denk, John A. Galvin and Thaddeus Galvin. The company will manufacture steering wheels, wind shields and other automobile accessories.

### AUTOMOBILE LAW AND LEGAL EVENTS.

### Unfavorable Ruling on Indiana Road Taxation Law.

An important ruling on the road laws of Indiana, which doubtless will retard road building in that State in the future. has just been handed down by the Indiana Supreme Court. This is to the effect that the law authorizing free gravel roads to be paid for by taxation levied on all property in the township, instead of by direct assessment, is unconstitutional. For some years there has been a law permitting fifty residents of a township to petition for a road, to be paid for by the township. After the completion of the roads, bonds have been issued and several millions of dollars worth of these bonds are now outstanding over the State. There is considerable speculation as to what will become of these securities.

The decision was rendered in a case appealed from Hamilton County, where a lower court refused to enjoin the county commissioners from letting the contract for a road to cost \$40,000, which was to be met by a bond issue. The Supreme Court reversed the decision of the lower court. Under the court ruling there is now but one method under which roads can be constructed. This is on petition of a majority of abutting property owners, the cost to be assessed against all property within one mile of the highway thus built. In several counties where roads are under construction, the cost of which was to have been paid by a township tax, the contractors have ceased work fearing there will be no way in which they can collect their money.

#### Renault British Patents Revoked.

Under the new British patents act, which requires foreign inventors to work their British patents to a certain extent if they wish to maintain their validity, a considerable number of patents relating to automobile construction owned by the Renault Brothers firm have recently been revoked. The most important of these is undoubtedly that relating to the cooling system employed in the late models of Renault cars, in which the radiator is located back of the engine and air is drawn through that portion of the radiator from outside the bonnet into the bonnet space and then forced out to the rear by a flywheel fan. Other patents of the Renaults which have been revoked relate to a lubricating system. to the Renault radially meshing change gear system, a spark plug, the conical friction clutch with slits in the cone and inward bent portions to insure gradual engagement, an electric terminal, an arrangement of cam gearing and a shock absorber. The Renault patent covering the direct drive and live rear axle, which is considered to be one of the most valuable automobile patents issued in Great Britain, has not been revoked. The decision in regard to the above patents is subject to appeal, but if no appeal should be made these inventions become public property.

#### New Jersey Law Upheld.

Justice Alfred Reed, of the New Jersey Supreme Court, last week ruled that the Frelinghuysen automobile law of New Jersey is constitutional in all points, in the test case brought by the White Company some time ago. Justice Reed said: "In view of the present need of vigorous enforcement of these laws for the protection of all users of the highways, I am of the opinion that the condition imposed that a man who proposes to use our highways for motoring shall agree to submit himself to the courts of the State into which he comes is legal."

### Atlanta Garage Ordinance to Be Toned Down.

An amendment to the Atlanta, Ga., garage ordinance has been introduced by Alderman F. A. Pittman, with the object of removing some of the present restrictions. The present ordinance forbids the housing of any other kind of business in a building in which a garage is located, but as amended the ordinance simply provides that there shall be no lodge rooms, assembly rooms or sleeping rooms in such a building. It is stated that an inspection recently made by the fire chief and building inspector of Atlanta disclosed the fact that of the approximately twenty-five garages in the city only three were complying with the letter of the ordinance in every respect.

### International Motor Traffic Bill in British Parliament.

The president of the British Board of Trade has introduced in Parliament a bill in connection with the international automobile traffic agreement adopted at Paris recently. The present bill provides for the grant of traveling passes, certificates or authorities that may be of use to residents of the United Kingdom when temporarily taking their cars abroad, or to drivers when proceeding abroad for the purpose of driving motor cars; also, for modifying the provisions of the Motor Car Act of 1903, relating to the registration of motor cars and the licensing of motor car drivers, in the case of motor cars brought temporarily into the United Kingdom by persons resident abroad and intending to make only a temporary stay in the United Kingdom, and of drivers entering the United Kingdom for the purpose of driving any such cars.

#### Legal Notes.

The city council of Greensboro, Ga., have passed an ordinance limiting the speed of automobiles to 8 miles per hour, and to 4 miles at crossings, and requiring cars to carry lighted lamps after dark.

Motorcycles operated in Milwaukee, Wis., must carry a muffler, if an ordinance now before the common council is passed. There are many objections, it being pointed out that the exhaust should be tolerated if only for the protection to pedestrians.

In the petition for the appointment of a receiver for the Auto Motor Car Company, of Cincinnati, Ohio, Reuben S. and John A. Payne and the Payne Motor Company have filed their answer, denying all the allegations made by the plaintiff, and asking for a dismissal of the suit.

Representative Ritter, chairman of the Finance Committee of the Ohio House of Representatives, has prepared the rough draft of a bill which he will ask the General Assembly to enact into a law at the next session which convenes in January, providing for graduation of fees for registering motor cars. Electrics will be charged \$3; gasoline and steamer cars of 20 horse power or less, \$5; cars between 20 and 40 horse power, \$10, and cars over 40 horse power, \$15. Trucks will be charged a uniform rate of \$5.

The Maryland Commission on automobile law and the A. C. of Maryland held a joint meeting on November 17, at which a compromise was effected in respect to license fees, and the bill drawn up by Col. Sherlock F. Swann was endorsed by the club. The club also agreed to a salary of \$3,000 for the Automobile Commissioner to be appointed under the law, instead of the \$2,400 which it formerly had held to be sufficient. The scale of taxes finally agreed upon is as follows: 20 horse power or less, \$6; 20-40 horse power, \$12; above 40 horse power, \$18.

#### French Motor Tourists' Industry.

From the number of triptyques issued by the different national automobile clubs and the number of customs passports given out by the clubs and touring associations, it is concluded that more American and British tourists visited France this year than ever before. Granting that six people were comprised in the average motor party, it is estimated that 24,000 motor car tourists from America and England visited France last year, and, assuming that each party stayed an average of one month, and spent about \$10 per day per person, it is figured that these tourists brought \$7,000,000 into France. These figures were prepared to show the folly of the proposed French tax on foreign motor tourists.

### Comparison of Gasoline and Alcohol Motor Tests.

The United States Geological Survey has just issued a bulletin on "Commercial Deductions from Comparisons of Gasoline and Alcohol Tests on Internal Combustion Engines," by Robert M. Strong. The tests, which were under the technical direction of R. H. Fernald, engineer in charge of the producer-gas section of the technologic branch, were conducted at the fuel testing plant in St. Louis, Mo., and at Norfolk, Va. The tests dealt primarily with gasoline, forming part of the investigation of mineral fuels provided for by acts of Congress. To determine the relative economy and efficiency of gasoline it was compared with denatured alcohol. When the series of tests was started, it was found that it took from one and one and a half to two times as much alcohol as gasoline to produce a given power. With special alcohol engines, entirely suited to the use of alcohol, the latter fuel has been made to do as much work, gallon for gallon, as the gasoline.

On this point the bulletin states: "By using alcohol in an alcohol engine with a high degree of compression (about 180 pounds per square inch above atmospheric pressure-much higher than can be used for gasoline, on account of preignition from the high temperatures produced by compression) the fuel consumption rate in gallons per horse power per hour can be reduced to practically the same as the rate of consumption of gasoline for a gasoline engine of the same size and speed. The indications are that this possible one to one fuel consumption, ratio by volume, for gasoline and alcohol engines, will hold true for any size or speed, if the cylinder dimensions and revolutions per minute of the two engines are the same."

Some of the more important results and conclusions stated in this bulletin are as follows:

The low heating value of completely denatured alcohol will average 10,500 British thermal units per pound, or 71,900 British thermal units per gallon.

The low heating value of 0.71 to 0.73 specific gravity gasoline will average 19,200 British thermal units per pound, or 115,800 British thermal units per gallon.

The low heating value of a pound of alcohol is approximately six-tenths of the low heating value of a pound of gasoline.

A pound of gasoline requires approximately twice the weight of air for complete combustion as a pound of alcohol.

A gasoline engine having a compression pressure of 70 pounds but otherwise as well suited to the economical use of denatured alcohol as gasoline, will, when using alcohol, have an available horse power about 10 per cent. greater.

When the fuels for which they are designed are used to an equal advantage, the maximum available horse power of an alcohol engine having a compression pres-

sure of 180 pounds is about 30 per cent. greater than that of a gasoline engine having a compression pressure of 70 pounds, but of the same size in respect to cylinder diameter, stroke and speed.

Alcohol diluted with water in any proportion, from denatured alcohol, which contains about 10 per cent. of water, to mixtures containing about as much water as denatured alcohol can be used in gasoline and alcohol engines if they are properly equipped and adjusted.

When used in an engine having a constant degree of compression, the amount of pure alcohol required for any given load increases and the maximum available horse power of the engine decreases with a diminution in the percentage of pure alcohol in the diluted alcohol supplied. The rate of increase and decrease respectively is such, however, that the use of 80 per cent. alcohol instead of 90 per cent., or denatured alcohol, has but little effect upon the performance of the engine; so that if 80 per cent. alcohol can be had for 15 per cent. less cost than 90 per cent, alcohol and could be sold without tax when denatured, it would be more economical to use the 80 per cent. alcohol.

The relative hazard involved in the storage and handling of gasoline and denatured alcohol is of particular importance in considering their use as fuels for marine and factory engines and engines to be placed in the basements of office buildings, in coast defense fortifications, or in like places where a general fire would be likely to result from the accidental burning of the fuel stored or carried for immediate supply, or where the forming of explosive or inflammable mixtures of the fuel vapors and air in the immediate vicinity would be hazardous.

In regard to general cleanliness, such as absence of smoke and disagreeable odors, alcohol has many advantages over gasoline or kerosene as a fuel. The exhaust from an alcohol engine is never clouded with a black or grayish smoke, as is the exhaust of a gasoline or kerosene engine when the combustion of the fuel is incomplete, and it is seldom, if ever, clouded with a bluish smoke when a cylinder oil of too low a fire test is used or an excessive amount supplied, as is so often the case with a gasoline engine. The odors of denatured alcohol and the exhaust gases from an alcohol engine are also not likely to be as obnoxious as the odor of gasoline and its products of combustion.

Very few alcohol engines are being used in the United States at the present time, and but little has been done toward making them as adaptable as gasoline engines to the requirements of the various classes of service. Engines for stationary, marine and traction service, automobiles, motor trucks and motor railway cars designed especially to use denatured alcohol have, however, been tried with considerable success.

The price of denatured alcohol is greater than the price of gasoline, and the quantity of denatured alcohol consumed by an alcohol engine as ordinarily constructed and operated is in general relatively greater than the quantity of gasoline consumed by a gasoline engine of the same type. Considerable attention is being given to the development of processes for the manufacture of alcohol from cheap raw materials which are generally available, and it seems reasonable to expect that the price of denatured alcohol will eventually become as low or lower than the price of gasoline, especially if the price of gasoline advances. It also seems reasonable to expect a greater general improvement in alcohol engines than in gasoline engines.

When used as a fuel denatured alcohol is not always so classed as to be exempt from restrictions placed on the use of gasoline by the rules of insurance and transportation companies or city ordinances. The restrictions that are placed on the use of denatured alcohol are, however, never greater than those placed on the use of gasoline. In some places they are such that the use of an alcohol engine is permitted where the use of a gasoline engine is prohibited. For instance, alcohol motor trucks and automobiles are admitted to many of the steamer piers in New York that are not open to gasoline machines.

When the restrictions placed upon the use of denatured alcohol are less than those placed on the use of gasoline or where safety and cleanliness are important requisites, the advantages to be gained by the use of alcohol engines in place of gasoline engines may be such as to overbalance a considerable increase in fuel expense, especially if the cost of a fuel is but a small portion of the total expense involved, as is often the case. Denatured alcohol will, however, probably not be used for power purposes to any great extent until its price and the price of gasoline becomes equal, and the equality of gasoline and alcohol engines in respect to ability to service required and quantity of fuel consumed per brake horse power, which has been demonstrated to be possible, becomes more generally realized.

A further general development in the design and construction of engines that use kerosene, or cheaper distillates, and the crude petroleums may be reasonably expected and may delay the extensive use of denatured alcohol for some time to come, but as yet comparatively few data pertaining to this phase of the general investigation are available.

Invitations will be sent out to 2,200 carriage dealers, as well as to a great number of automobile agents, to attend the Grand Central Palace Automobile Show in New York, which opens on New Year's eve, as guests of the management.

# The Automobile Industry Affecting Wages.

The influence of the automobile builders in raising the general standard of wages in the machinery and allied industries has been brought home to a great many employers of labor during the process of increasing working forces which is now going on. The impulse which sends the labor market upward originates largely with the great plants that employ a high percentage of skilled labor. They absorb the surplus idle men and then seek for men wherever they are available. Offers of higher pay in such special cases exert an irresistible influence toward a general advance. The automobile industry has come to be the greatest factor of all in this connection; it is felt the more because the plants have increased enormously during a period when most lines of manufacture were experiencing poor business and were compelled to lay off large portions of their forces

'The great movement of skilled labor is toward the Middle West. In the East there is general complaint that the Western inducements offered employees are so attractive that they are migrating by the hundred. Young men especially show eagerness to embrace the opportunities opened to them. There is difficulty in retaining the services of apprentices when they graduate into journeymen; they are leaving the machine tool builders in almost disheartening numbers. In some cases the higher prices are met, in order that shop organizations may not be too seriously disturbed. In others the attempt is held to be The successful automobile manufacturer has achieved his position in the trade largely through the excellence of his product. This he must maintain, and it can be accomplished only by keeping up a high standard of workmanship. He must have the men. If other employers meet his prices he must raise the figure. Therefore there is good reason in many instances for not trying to keep men who have been approached with offers of more liberal wages than their employers can afford to establish. The automobile people who are expanding the most rapidly have probably made very large profits and can afford to pay extravagant wages in order to retain their reputation as manufacturers and the earnings which go with them.

This condition, it is expected, will tend toward higher prices for the product of the machine shops. The machine tool industry is now suffering from the combination of a scarcity of help and higher prices for labor. There seems to be no alleviation of the condition except in increased concentration or the development of specialists, by the training of unskilled men to do some one work well, and a combined effort, through apprentice systems and industrial schools, to provide for a future in which good men will be available in numbers better proportioned to the demand.

The Bureau of Statistics of Massachusetts

has just published figures which illustrate the different wage conditions as they exist in the industries, two of the headings being "automobiles" and "foundry and machine shop products." Unfortunately the figures are for the dull year of 1908, which was not a happy one, and make a legitimate comparison impossible. The automobile business was excellent, while the foundry and machine industries were dull. But, on the other hand, the automobile people were able to get the best of men at wages below the present market, and while foundry and machine shop help is probably as well paid in Massachusetts as anywhere, taking the average, wages in the automobile plants of the Middle West are higher than in those of the New England States. Other corrections may have to be taken into consideration. But the fact that the average yearly wage paid by the automobile industry in Massachusetts was 25 per cent, greater than in the machine shops and foundries, as a whole, is significant. Thirteen automobile factories, with \$3,216,000 of capital devoted to production, paid \$1,223,000 in wages to an average payroll of 1,627 persons, making an average annual earning of \$752.11. The value of the product was \$5,443,000, and that of stock and materials consumed was \$1,526,000. Thus the net profits, above labor and material, was \$2,693,000, or 49 per cent. The percentage of wages to capital was 38. The manufacturers of foundry and machine shop products to the number of 519, with capital of \$60,525,000 devoted to production, paid \$18,600,000 in wages to an average payroll of 31,112 persons, making an average annual wage of \$601. The value of product was \$52,208,000; that of stock and material \$20,791,000. The net profit above labor and materials (not including overhead expenses, of course) was \$16,716,000, or 30 per cent. The percentage of wages to capital was 30. A comparison of these figures affords good reasons why the automobile industry can afford to pay high wages; in fact, why it has to pay them, if they are required in order to get the best labor possible. If the machine tool builder and others resent the presence of this new competitor for labor the consolation must always be kept in mind that the automobile is the best customer that has made its appearance in years.—Iron Age.

# A. O. Smith Company Buys More Land.

An additional 15.5 acres has been purchased by the A. O. Smith Company, of Milwaukee, Wis.. said to be the largest manufacturers of pressed steel frames in the world. The tract adjoins the site of the new factory, to be ready for occupancy on January 1. President A. O. Smith said that the additional land, which cost \$45.000, will be used for future extensions and additions. An idea of the size of the new plant may be gained from these dimensions: Main factory, 287x1,025 feet; power house, 70x400 feet; office, two stories, 60x148 feet.

#### Recommendation of American Manufacturers to International Conference.

The Automobile Club of America, as the officially recognized representative of America in the International Conference of Automobile Clubs of all Nations, which meets at Paris on December 7, to decide on the international racing formula for 1910, has forwarded to its delegate in Paris, William S. Hogan, the recommendations made by the Manufacturers' Contest Association, representing the consensus of opinion of the American automobile manufacturers as a basis for international automobile competitions for 1910.

Although the Automobile Club of America has for a number of years past annually requested the American manufacturers to define their attitude on these matters, in order that America might be represented in the International Conference. this is the first time in the history of the sport that a definite exposition of the attitude of the majority of the American manufacturers has been put forward.

The adoption of a classification by piston displacement and minimum weight with a "stock car limitation" is the result of the past experience of the American manufacturers and especially of the past year of racing and contests in America, when it was well tried out. It is a logical and advantageous classification for automobile competition, both from the standpoint of the manufacturer and the intending purchaser, and is recommended for international adoption. The recommendations are:

First—That only bona fide stock cars or stock chasses be eligible for entry in international events.

Second—That cars entered in international events be classified as follows:

Open to any chassis which is in accordance with the definition of a "stock chassis" and in accordance with the following table of piston displacement and minimum chassis weights:

	Piston	Minimum
	Displacement in	Weight
Division.	Cubic Inches.	in Pounds.
ī	160 and under	1,200
2	161 to 230	1.500
3	231 to 300	1,800
4	301 to 450	2,100
5	451 to 600	2,400
6	for and over	2 600

No car shall compete in any class above that to which its weight entitles it.

This recommendation is along the lines which will govern automobile competition in America for the coming year, with the possible exception of the larger classes. As the American manufacturer will no doubt build "stock cars" up to the limit of each of these piston displacement classes, should a similar classification be adopted internationally it would enable foreign and American cars to compete on even terms and should serve to stimulate international competitions. It is known that some of the French makers favor the abolition of all restrictions.

### NOTES OF THE INDUSTRY AND THE SPORT.

The Federal Rubber Company, of Milwaukee, Wis., has established a Southwestern branch at 102 Pryor street, Atlanta, Ga.

The winning car in the recent Los Angeles-Phœnix race, which was fully reported in our last week's issue, was equipped with Goodyear tires and rims.

The Bettendorf Axle Company, of Bettendorf, Ia., have purchased the factory and site of the Meteor Motor Car Company which was recently badly damaged by fire.

The Toledo Motor Company, of Toledo, Ohio, has changed its name to the Willys-Overland Company, by amended articles recently filed with the Secretary of State.

The American Oxy-Acetylene Welding and Cutting Company are establishing a plant at 2306 Olive street, St. Louis, Mo., where demonstrations of the process will be given after November 23.

The Michelin Tire Company have opened a branch in Kansas City, Mo., at 1926 Grand avenue, where a full stock of tires, sundries and accessories will be carried. The branch is in charge of Wayne Murray.

Operations on the new building under construction for the DeSchaum-Hornell Motor Company, at Hornell, N. Y., have been suspended owing to differences between the company and the contractors.

The Grabowsky Power Wagon Company, Detroit, Mich., are building an addition to their present factory building. They are also looking about for a suitable factory building in addition to the one they are now occupying.

The Buffalo Automobile Trade Association, at a meeting held at the Iroquois on November 16, decided to hold their annual show in Convention Hall during the week of March 7. Wm. C. Jaynes, president of the association, presided.

In an advertisement of the Hartford Suspension Company, in our last week's issue, it was erroneously stated that "the leading automobile manufacturers are now regularly equipping their cars with the Truffault-Hartford with extra charge." It should, of course, have read "without extra charge."

One of the taxicab companies operating in Chicago, in a communication to the board of managers of the Chicago A. C., offers to contribute \$100 to a fund to be used for the erection and maintenance of permanent steel gates at the approaches of swing bridges, in case the city of Chicago refuses to install them.

The United States Motor Truck Company, of Cincinnati, Ohio, have closed a lease for the old manufacturing plant of the Ahrens Fire Engine Company at 214-216 Webster street. The buildings contain 40,000 square feet of floor space and the lease runs for four years at a rental of \$7,000 for the term. The company expect

to complete their first ten motor trucks within the next thirty days.

The Schaefer Company, of Berlin, Wis., foundrymen and gasoline motor manufacturers, are doubling the capacity of their plant by additions costing \$15,000, with the intention of entering the automobile truck manufacturing field. The first truck is about completed.

The Lagerquist Carriage Company, 209 West Grand avenue, Des Moines, Ia., have begun the construction of a three story vitrified brick automobile and carriage factory. Mr. Lagerquist has been manufacturing delivery automobiles, known as the "Hawkeye," for several months.

The Weyher Manufacturing Company, Whitewater, Wis., are placing on the market a 1,000 pound water cooled, two cylinder delivery wagon fitted with the improved Waite friction drive. The output of the factory will be handled by the Car Makers' Selling Company, 1256 Michigan avenue, Chicago, Ill.

The Indiana Automobile College has been organized in Indianapolis, for the purpose of conducting an automobile school of instruction. It is incorporated with an authorized capitalization of \$5,000, with C. S. Gant, Jessie G. Gant, Ozoro Belle Gant, Charles C. Pettijohn, Samuel Glick and Nellie A. Glick.

The Maxwell-Briscoe Motor Company, of Tarrytown, N. Y., announce an increase in the price of their 12 horse power runabout from \$550 to \$600, and on their four cylinder, 22 horse power runabout from \$850 to \$900. There will be no change in the price of their 30 horse power, four cylinder car.

The Gardner Engine Starter Company, of Chicago, Ill., manufacture an attachment for Ford Model T rear axles, to reinforce the axle, taking the place of a brace rod. It is claimed to seal up the differential housing so that grease will not leak out, and to prevent vibration and chattering when the car is being driven on the low gear.

State Highway Commissioner J. C. Wonders, of Ohio, will shortly issue a complete road map of the State by counties, which will be a great boon to autoists. The map will show every turn in the road, bridge, railroad crossing, hill, etc. It will be offered in book form for autoists to carry in the receptacles in their cars, and may be published in color later.

Mayor Bookwalter and other city officials of Indianapolis witnessed a test with a motor fire engine, made by the Howe Engine Company, on November 17. The engine was equipped with a six cylinder motor, which, in addition to driving the car, was used for driving a six cylinder pump.

The company is now planning to build a machine equipped with two four cylinder motors, operating two pumps, especially designed for metropolitan service.

#### Club Notes.

A movement is on foot for organizing an automobile club in Dayton, Ohio. Most of the dealers of the city are taking an active interest in the plan.

The Board of Managers of the Chicago A. C. are considering a plan to enlarge the quarters of the club, and may secure two floors of the building next to the club house in Plymouth Court.

The Automobile Club of America opened the entertainment season last night (Tuesday), with an address on "Experiences in Hunting Big Game in South Africa," by Bayard Dominick, Jr.

The A. C. of Hartford, Conn., has received a large wall map of the State of Connecticut from C. D. Rice, chairman of the committee on good roads and sign-boards, and the assistant secretary of the club is preparing a chart giving the road distance between any two of 275 towns in the State.

At the annual meeting of the Chicago Motor Club last week a plan to establish a special automobile track in that vicinity was outlined by David Beecroft, chairman of the technical committee. It was stated that the scheme would meet the co-operation of the Chicago and Northwestern Railroad and the Chicago and Northwestern electric line.

The Auto Drivers' Protective Association has been organized at Chicago, Ill., with a charter membership of 115, to make "war on reckless drivers, rich or poor, small or great." The organizing meeting was held in the office of Walter W. Wilcox, 107 Washington street, and the following officers were elected: Walter W. Wilcox, president; Taylor A. Snow and F. McH. Kitching, vice presidents; Neil Gronberg, secretary; Roy O. Gilbert, treasurer, and E. M. Seymour, general counsel.

Racing Notes.

Barney Oldfield made a new mile record for a one mile track of 53 3.5s. on the San Antonio, Tex. track on November 15.

The judges of the recent Los Angeles-Phænix race, after reviewing the rules and precedents governing the contest, came to the conclusion that they were only to decide upon the winner of the race, taking no official action upon the claims of the contestants for second and third places. The award of second place to the Isotta car, as mentioned in the addition to our report in last week's issue, was therefore withdrawn, and the judges state that in their private opinion the Columbia deserved being awarded second place and the Isotta should be disqualified.

The Flag to Flag Endurance Contest, from Denver to Mexico City, which was to have been held on November 22, has been declared off for this year, but may be held in June or July of next year during the centennial celebration at the Mexican capital.

#### Trade Personals.

LEO CHAPMAN has been appointed sales manager of the Glide Motor Company, of St. Louis.

CHARLES WAUGH, a prominent carriage and automobile dealer of Boston, died at his home in Cambridge, on November 19, aged sixty years.

A. B. CORDNER, formerly of the A. B. Cordner Company, of New York, has become manager of the Rapid Motor Vehicle Company sales branch in this city, which will be opened at Sixty-fourth street and

P. L. Hussey has resigned from the firm of Brandenburg & Co., Chicago, Ill., the resignation to take effect December 1, to join the new F. Z. H. Parts Company, 1256 Michigan avenue, composed of Messrs. Fulton, Zinke, and Hussey.

BARON VON GIENANTH, the American reppresentative of the Benz Company, has been made an honorary member of the Atlanta Chamber of Commerce, in recognition of his co-operation in the conduct of the New York-Atlanta Good Roads Tour.

ERNEST A. Moross has withdrawn his resignation as director of contests of the Indianapolis Motor Speedway, which was to have become effective on November 15. The action was taken at the earnest request of the management. Plans are now under way for a race meet on the course on December 11. If this can be held, there will be events for all of the stock chassis classes under the A. A. A. rules and there will also be a 1,000 mile race.

#### New Incorporations.

The Delaware Garage Company, Wilmington, Del.-Capital stock, \$100,000.

The Ewing Automobile Company, Geneva, Ohio, has increased its capital stock from \$75,000 to \$300,000.

The Stuyvesant Motor Company, Cleveland, Ohio.-Capital stock, \$200,000. Incorporators, F. E. Stiverson and others.

The Henry Motor Car Company, Muskegon, Mich.—Capital stock, \$200,000. Incorporators, Wm. L. Simonton, David W. Henry, John Q. Ross.

The Automobile Insurance Company of America, Indianapolis, Ind.—Capital stock, \$1,000,000. Incorporators, D. M. Parry, John McCardle and others.

The Casa Loma Garage, Redlands, Cal.-Capital stock, \$25,000. Incorporators, C. A. Tripp, W. F. Stutt, Robert Leith, Robert Barker and Thomas Younghusband.

The Automobile Advertising Company, Spokane, Wash.—Capital stock, \$20,000. Incorporators, G. C. Stevens, W. S. Coey, H.

L. Tibbetts, A. Witmans and C. N. Hornibrook.

The Abbott Motor Car Company, Detroit, Mich.—Capital stock, \$300,000. corporators, Chas. S. Abbott, John Phillips, John G. Utz, A. T. O'Connor and others.

The Twin City Taxicab Company, Minneapolis, Minn.-Capital stock, \$600,000. Incorporators, A. S. Elford, W. S. Vent, of St. Paul, and W. J. Prowell, of New York.

The Rauch & Lang Carriage Company, Cleveland, Ohio, have increased their capital stock from \$250,000 to \$1,000,000. The additional capital is designed to cover the cost of enlargements of the firm's plant.

The Horseless Age Company, 11 Murray street, New York.—Capital stock, \$100,-000. Incorporators, Fred J. Wagner. New Rochelle, N. Y.; Chas. B. Ames, Metuchen, N. J., and Samuel B. Stevens, Rome, N. Y.

Charles D. Quier, a vehicle top manufacturer, of 1323 West Eleventh street, Kansas City, Mo., died from apoplexy on November 8, aged fifty-nine years. He was a native of Allentown, Pa.

#### Trade Literature Received.

Chelsea Clock Co., Boston, Mass.—Descriptive catalogue of "Chelsea" clocks.

D. H. Lawrence Co., Sterling, Ill.-Catalogue describing the Pitner automobile pump.

The Standard Gauge Co., Foxboro, Folder entitled "Something About Gauges."

Pfanstiehl Electrical Laboratory, North Chicago, Ill.-Folder on Pfanstiehl magnetos and coils.

Packard Motor Car Co., Detroit, Mich.-Folder relating to applications of the Packard truck.

Frank Mossberg Co., Attleboro, Mass.—Catalogue of monkey wrenches and the Auto Cle wrench. Liggett Spring & Axle Co., Pittsburg, Pa.-Cata-

logue of automobile springs, showing the different Detroit Steel Products Co., Detroit, Mich .-

Pamphlet on "Fenestra" window sash for garages and factories.

Star Brass Works, Chicago, Ill.-Folder on the practical use of the Star vehicle washer and descriptive of the Binks compound air pump.

Electric Ignition Co., Ltd., Sampson North, Birmingham, England.—Catalogue Road trating the Hall system of dual ignition, including magneto, spark plugs and waterproof coils.

The G & J Tire Co., Indianapolis, Ind.— Pamphlet, "An Ounce of Prevention That Is Worth a Pound of Cure," on the care and repair Also a catalogue of "Tires and Sunof tires. dries."

Continental Caoutchouc Co., New York .- Consumers' prices on Continental tires and demountable rims, showing the equipment required for mounting and removing demountable rims and ready flated tires.

### European Trackless Trolley Vehicles and Installations.

By Ernst Valentin.

Attention has repeatedly been called to the advantages of the electric system for the propulsion of road vehicles, as compared with the gasoline and steam systems; but it has generally also been pointed out that a satisfactory solution of the question of supplying the electric motors with the necessary current had not yet been found. If storage batteries are carried along on the vehicle the radius of action is limited to about 60 miles, and the profitableness of the service is doubtful on account of the heavy weights to be carried and the short life of the battery. On the other hand, the generation of the necessary current on the car itself requires the installation of a special gasoline motor and electric generator, which complicates the assembly of the chassis and introduces a number of difficulties which it has so far been impossible to entirely overcome.

Attempts have therefore been made to

supply the necessary operating current to the cars in a different manner, and these attempts have met with such favorable results that an investigation of such services in respect to construction and profitableness seems timely. This characteristic feature of these systems consists in the installation of an overhead conducting wire along the route to be covered, similar to the overhead wires of electric street railways. The system differs from the ordinary trolley system, however, in that no special rails are laid in the streets, the current from the feed wire being led to cars running on rubber or iron tired wheels. Such lines are, therefore, logically referred to as trackless trolley lines.

In the following discussion the two systems which have been in successful practical operation in Germany and Austria, respectively, for some years, are taken as representative types. These systems are being exploited, respectively, by the Gesellschaft für Gleislose Bahnen, Max Schiemann & Co., in Wurzen, Saxony, and the Oesterreichische Daimler Motoren-Gesellschaft, in Vienna-Neustadt, which latter exploits the Mercedes Electrique-Stoll system. Other systems have been tried out in the United States, in Italy (on the Pescara-Castellamare route), in Germany (from Oberschöneweide, near Berlin, to Johannistal), etc.

It is unnecessary here to enter into the construction of the poles or brackets which are secured to the adjacent buildings for carrying the conductor wires, as the arrangement is essentially the same as with street railways. It should be pointed out, however, that in the case of trackless trolley lines, two trolley wires are always required, as the rails which are generally used for the return circuit in street railway practice are here absent. The trolley wires are installed at

FIG. I.—INDUSTRIAL TRACKLESS TROLLEY LINE AT WURZEN, SAXONY,

FIG. 2.—TRACKLESS TROLLEY LINE ON DAIMLER-STOLL SYSTEM.

a height of 17 to 20 feet above the ground. The cars are generally operated with continuous current at from 500 to 550 volts.

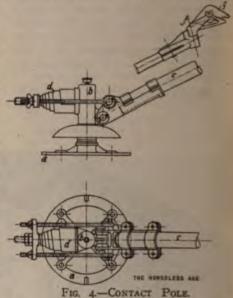

The method of fastening the wires to the poles differs in the Schiemann and Daimler systems, owing to the fact that in the Schiemann system the current is taken from the wires through spring supported trolley poles from below, and in the Daimler-Stoll system through loaded rollers from above, as may be seen from the general views of these installations, Figs. I and 2. In the case of the Schiemann system Fig. 3 illustrates the design of the double insulators necessitated by the double trolley line. The wires themselves are secured to clamps fastened to

the insulating plugs, in such a manner that the current collectors make contact with the wires from below. In the design of the current collecting mechanism it must, of course, be taken into account that the vehicles must be free to run over the entire width of the road. Otherwise difficulties would ensue whenever horse vehicles are met or overtaken. 'This rather difficult problem has been solved by Schiemann by the adoption of rather long trolley poles with rotatable driving contacts.

The design itself is shown in Fig. 4. The base a is secured to the roof of the car and carries the rotary housing b. The contact pole c, which is from 17 to 20 feet long, is pivoted to the housing b

and is pressed by the strong spiral spring d upward against the conductor wires. To the upper end of the contact pole : is secured a forked casting f, which has hinged to it the rotatable sliding contact The lower part of this contact is filled with grease in order to save the trolley wires as much as possible, and the contact is of unusual length in order to operate without arcing. Whenever two of the trolley vehicles meet the driver of one must take his contact pole from the wires until the other one has passed. The same applies in the case where an omnibus, for instance, is overtaking a freight train ahead of it.

The current collector of the Daimler Motor Company is illustrated in Fig. 3. As already pointed out, it presses on the trolley wires from above. In order to insure very easy motion the current collectors themselves are developed as rollers, and there are two rollers to each pole, in order to insure sparkless operation. In order to properly guide the rollers they are limited below by means of projecting metal parts. A suspended

weight is carried at the middle of the contact carriage, and to the rod of this weight, at about one-tenth the distance from the top, is secured the trolley cable. The cable containing the two wires leads from there down to the roof of the car, where it taken up by a short pole. In order to always provide the tension for the cable necessary to reliable operation its end is fastened to a drum provided with a spring mechanism which constantly tends to wind it up. This cable drum, together with its short pole, can be easily removed, and whenever two of the vehicles meet they simply exchange their complete poles and cable drums.

If now we pass to the operating equipment proper, we may distinguish between two, or, better, three, classes of vehicle, namely, omnibuses and trucks which are themselves equipped with motors, and

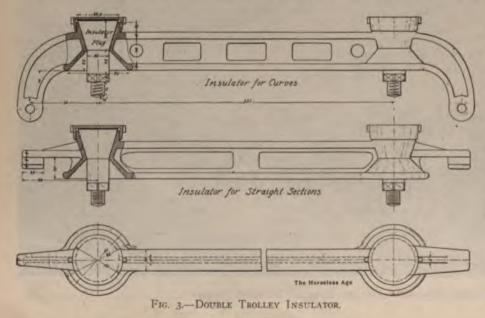

Fig. 9.—Mercedes-Stoll Trolley.

besides, goods trains for heavy transportation. The latter consists, as a rule, of a tractor and a series of trailer vehicles.

Fig. 6 shows the tractor of the Wurzen industrial motor line road train illustrated in Fig. 1. The tractor is arranged in accordance with mining locomotive

practice, in that it may be run equally well in either direction. The driver's cab is in the middle, and can be entirely enclosed. The complete drawings of this tractor, shown in Fig. 7, show that all

four wheels are driven by means of two separate electric motors, so that the total weight of about 6 metric tons of the tractor is available for traction purposes, which permits of hauling several fully loaded trailers. If we assume that each wheel carries a load of 11/2 metric tons and the tires have a width of 8 inches, we find that the wheel pressure is about 400 pounds per inch width.

Both of the axles are mounted on a rotatable truck each, on which the upper frame is carried on special rollers. The running gear is supported on long leaf springs, while the electric motors are provided with two spiral bumper springs

each. The motors develop each about 24 horse power, and are wound for continuous current of 550 volts. The drive from the motors to the axles is through toothed gearing. No differential gear is employed, but the wheels are driven from the axles through ratchet devices or one-way

clutches. The vehicle is steered by rotating the two trucks simultaneously by means of a threaded spindle, which is operated by means of a hand wheel located at one side of the driver's cab. At the same side of the cab

Fig. 6.—Schiemann Tractor.

is arranged the controller for the electric motors. The controller affords nine different speeds, four with the two motors in series and five with the motors in parallel. For the three main positions—"ahead," "stop," and "backward"—a special reversing switch is provided.

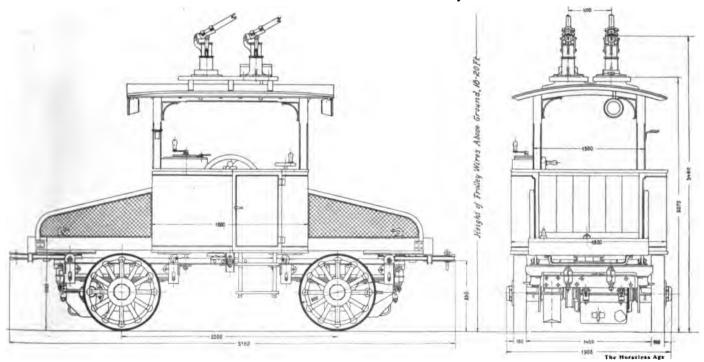

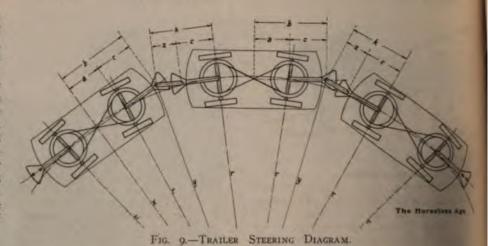

FIG. 7.—SIDE AND END ELEVATION OF SCHIEMANN ELECTRIC TRACTOR.

The design of the trailers is shown in Fig. 8. The most interesting feature of these trailers is the method of steering, which consists in turning the two trucks which carry the main frame of oak wood. The steering is effected automatically, since the tractor is connected with the first of the trailers in a special way, and each of the trailers is coupled to the following one. These steering methods of motor road trains have been very thoroughly investigated, among others by W. A. Th. Müller in his book on "Der Automobilzug," page 25 and following. As may be seen from Fig. g, the theoretical conditions which must be met in order that the separate vehicles of the Schiemann train may track are that

$$r^{2} = a^{2} + x^{2}$$
  
 $y^{2} = b^{2} + x^{2}$ ;  $y^{2} = r^{2} + k^{2}$   
 $a^{3} + x^{2} + k^{2} = b^{3} + x^{2}$   
 $k^{2} = b^{3} - a^{3}$ ,  $k = \sqrt{b^{2} - a^{2}}$   
 $Z = k - (b - a)$ 

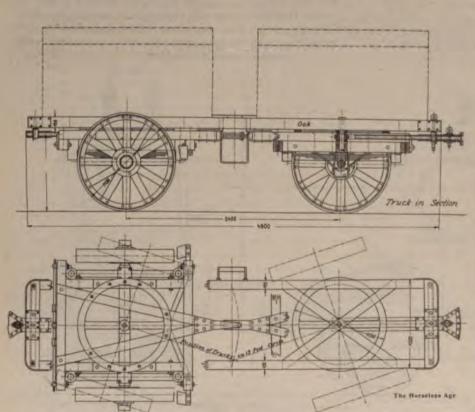

In the above r represents the turning radius; a, the distance from the centre of the king bolt of the trucks to the centre of the vehicle; b, the distance of the coupling point to the true centre c; b-a, the distance of the coupling point from the centre of the king bolt; k, the distance of the coupling point from the king bolt of the following trailer; x, the distance of the central point of the vehicle from the centre of the turning circle; y, the distance of the coupling point from the centre of the turning circle; and x, the length of the coupling piece itself or the distance between the two coupling points.

The following illustrations show the run-

ning gear of a vehicle employed in connection with the Mercedes Electrique-Stoll trackless trolley system, as exploited by the Austrian Daimler Motor Company. use of hub motors gives the chassis an extraordinarily simple appearance. The chassis frame is entirely devoid of mechanism, except for the steering post and electric controller at the extreme front. The frame is carried through long semi-elliptic springs in the front axle, which is provided with the usual pivoted steering knuckle, and also on the rear axle, whose wheels contain the driving motor. The weight on one of these chasses complete is only about 3,740 pounds. Fig. 10 clearly shows the rear driving wheels, Attention is called to the fastening of the springs to the frame-by means of drop forged shackles; to the large brake drum and the operating links for the two expand-

ing brakes. The motor itself is shown in Fig. 12, Special attention is called to the arrangement of the commutator brushes is a vertical plane. This arrangement is claimed to obviate the possibility of the brushes being thrown out of contact with the commutator by the rather severe jarring in connection with solid rubber tires, as would be likely to occur with the usual arrangement of the brushes. The motors have a normal output of an horse power and may be overloaded 100 per cent, for short periods. The energy consumption per ton-kilometre is given as fifty-four watt hours in summer and seventy watt hours in winter. Fig. 10 shows the construction of the forward part of the chassis more in detail. At the right of the driver is arranged the steering wheal, through which a cross steering bar is actu-

FIG. 11.—EXCHANGING TROLLEY CABLES.

ated. The reason for the adoption of a cross steering rod was that it was considered important to place the steering gear as far forward as possible, to leave as much as possible of the frame free for loading purposes. This illustration shows the cable drum very plainly, which holds the cable. coming from a lateral roll, constantly taut. About 30 to 35 feet of cable can be rolled up and unrolled, whereby the vehicles are permitted to pass or overtake other vehicles and run over the whole width of the road. Fig. 11 illustrates the manner in which two vehicles of a single trolley installation exchange their current collectors on meeting each other. This is effected by interchanging the two plug contacts leading to the cable drum. The vehicles of this line are still provided with the formerly customary arrangement of hub motors in the front wheels. At present the Mercedes front wheel drive is only employed when all four wheels are driven, as in the case of road

The controller is operated with the left hand, the same as on street cars. In order to protect the forward mechanism, and especially the resistances against dust, the pressed steel frame of the vehicle frame is provided in front with a special sheet metal housing.

#### The "Dynatak."

Prof. N. Monroe Hopkins, of the George Washington University, Washington, D. C., has invented an instrument styled the "Dynatak," which is designed to furnish a continuous indication of the performance of an internal combustion in several respects.

The device consists of a special spark plug for use in each cylinder, with which is incorporated a thermo-electric couple of peculiar construction. This thermo couple, when exposed to the explosion within the motor cylinder, furnishes an electrical pressure

Fig. 12.—MERCEDES MOTOR.

which is in proportion to the temperature existing within the cylinder, and this pressure is arranged to indicate upon a suitable electrical instrument within view of the operator.

Cylinder temperature increases with the rate of fuel combustion within the cylinder, and hence the indications of the instrument represent to a certain extent the output of the cylinder when speed is also taken into consideration. The connections are so made that the temperature in any particular cylinder may be separately indicated, and by putting the thermo couples in series the reading represents the combined temperatures of all the cylinders, or, to a certain extent, the torque of the motor. When a tachometer reading of the motor is simultaneously taken the product of this with the electrical reading gives an idea of the motor output. If one cylinder is missing the temperature of the thermo couple will be very low, and the low indication given when this cylinder is tested will indicate the condition of faulty ignition.

Cylinder temperature will also depend

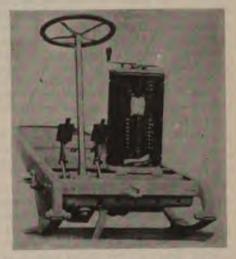

FIG. 14.—FRONT OF CAR WITH CONTROLLER.

upon the correctness of the mixture, and thus the indication of the instrument may be used as an index in perfecting the carburetor adjustment, the mixture proportions being properly so arranged that the temperature indication shall be a maximum for any given throttle opening.

The tachometer used in connection with this instrument is a small engine driven magneto generator, and the current which it affords is measured on a separate scale upon the dial of the power indicating instrument, which is calibrated so as to read in terms of speed.

A most vital point in the construction of this instrument is that of the thermo couple incorporated with each spark plug in order to avoid the possibility that the thermo couple may cause preignition by becoming too hot or be disintegrated by the heat. By very extensive experimentation a special form of thermo couple has been developed, which, it is claimed, is entirely free from these objections, and which will give the same readings upon the recording instrument even after 50,000 miles of service.

### GREAT QUESTIONS OF AUTOMOBILE ENGINEERING.

#### Valve Location.

By Albert L. Clough.

Valve location is of moment mainly in regard to its bearing upon the form of the cylinder to which such valves are applied, and in regard to the operating mechanism and piping which the various arrangements imply.

While there are a number of special valve arrangements, each to be found upon one or two makes of cars, practice seems to have settled down to two forms of pocketed valves; namely, first, that in which a pocket upon one side of the cylinder contains the exhaust valve and another similar pocket upon the other side of the cylinder contains the inlet valve, and second, that in which both valves are located in a single chamber upon one side of the cylinder. The cylinder in which the first arrangement is embodied is known from its form as the T cylinder, and that in which the second method prevails the L cylinder.

Distinct from this construction, in which the valves occupy pockets or communicating chambers upon the sides of the cylinder heads, is the valve in the head arrangement, which is employed by enough manufacturers to give it importance.

Among the advantages which may be cited in regard to the valve in the head arrangement or overhead valve arrangement may be mentioned the following:

That the form of the cylinder which is demanded by theory on the ground of thermal efficiency (that of a perfect cylinder with domed head) is practicable with overhead valves, and that the high efficiency which theory ascribes to this form of cylinder, with its minimum wall space per unit of volume and its consequent low loss of heat to the jacket water, is attained by their use.

That the reduced loss of heat through the walls obtained by eliminating the interior exposed surface of the valve pockets makes cooling of the cylinder easier, and reduces the radiator capacity required.

That the cylinder, being perfectly cylindrical and free from projections, warps less in manufacture and is free from the liability of distortion in service. Furthermore, that having no attached pockets, its entire inside surface can be machined, the clearance space thus adjusted, and any fins or "swags" likely to cause preignition readily removed.

That upon the opening of an overhead exhaust valve the spent gases directly leave the cylinder, and do not have to pass through any pocket in making their exit.

That if an overhead cam shaft is used to operate the valves there is no cam shaft in the crank case, and there is room saved so that the inspection plates may be made

large enough to permit of removing the pistons therethrough.

Among the disadvantages urged against overhead valves are the following:

That the valve, in order to be removable for regrinding, must be carried in a cage, and that the joint between the cage and its seat in the cylinder reduces the rate of cooling, and allows the exhaust valve to distort and pit, and that the possible chance of an air leak into the intake system is increased. It is also difficult to arrange matters so that the exhaust valve stem shall be adequately cooled. That the machining of the cylinder to take overhead valves is costly. Furthermore, that the valve action is complicated and expensive. If an overhead cam shaft is employed a vertical shaft, with additional gears and bearings, is required to give it motion, and that the cam shaft in this position is difficult to lubricate, and requires a special housing. That the rocker arms required to communicate motion from the cams to the valve stems add to the complication of the arrangement, That the rocker arms, despite the use of "take up" springs and fibre tipped tappets, make more noise than the mechanism of direct actuated valves. That if the overhead cam shaft is not used, the walking beams employed to operate the valves are subject to the same objections as to complication and noisy operation.

In addition, if the caged valve construction is adopted to render the valves removable, it is usually necessary to break the pipe connections when a valve is taken out, and, moreover, that a valve in the head engine is less sure to fire its charges at very low throttle openings.

The advantages claimed for pocketed valves are that they require no caged construction, but seat directly in the metal of the cylinder, and thus may be more adequately cooled by water circulating about their seats and even about their stem guides. At the same time they may readily be removed by unscrewing the caps which close apertures in the upper walls of the pockets, without disturbing the piping. They are directly operable by push rods, actuated by the cams of an enclosed cam shaft supported by and housed in the crank case structure, this mechanism being simple and quiet.

In criticism of the pocketed construction it is pointed out that the walls of the pockets offer surfaces which withdraw heat from the burning charge and act to materially reduce the ratio of the pressures existing within the cylinder after and prior to the explosion, thus reducing the output and efficiency of the engine.

That the cylinder, not being of true cylindrical form, is subject to warping in service, and as the internal surfaces of the

pockets cannot well be completely machined, the compression space cannot be perfectly adjusted.

That the charge and exhaust gases do not follow so direct a path in moving through the valves and ports in the pocketed construction as in the overhead construction, which tends toward a lowering of the charge ratio, and hence the output of the cylinder, and also tends to raise the exhaust back pressure.

As to the relative advantages of the T and L construction, it is urged that the T cylinder, being symmetrical as to its projections, is less likely to warp out of usable shape in casting than is the L cylinder, with its unsymmetrical form, and that the valve diameter is not restricted by the necessity of placing two valves and their surrounding metal and water spaces in a length equal to the cylinder diameter. That the piping, being distributed equally upon both sides of the engine, is less crowded, and the valves and their mechanism are more accessible. That in event of inlet valve trouble it can be rectified without danger of burning from the hot exhaust pipe.

As disadvantages, it is pointed out that the cooling surface exposed to the explosion by the pockets is very large in this construction, and that there is a tendency toward distortion due to the difference in temperature between the inlet and exhaust sides. That two separate cam shafts are required to operate inlet and exhaust valves, respectively, and that this entails unnecessary expense in manufacture and upkeep, adds some weight and increases the noise.

Among the advantages claimed for the L cylinder arrangement are that but one cam shaft is required, which eliminates several gears, one cam shaft and its bearings, and makes it possible to provide very large crank case hand holes on the opposite side of the engine. That the valves and piping being all upon one side, the other side of the engine is left perfectly "clean" for the location of the auxiliaries. That the cool, incoming charge tends to reduce the temperature of the exhaust valve located close beside it, and helps to keep the whole valve pocket at a reasonable temperature.

That the total surface, causing loss by cooling the expanding gases, is less than in the T cylinder, and that the engine is consequently a little more efficient. That it is the least expensive construction considering the results obtained.

As an offset to these advantages it is claimed that the piping is very much crowded upon one side of the engine, and that it is impracticable to adopt as large valves as in the T construction without making the pocket overhang the cylinder fore and aft or by using valves inclined to the cylinder axis.

#### THE HORSELESS AGE

Founded in 1895 by E. P. Ingersoll. Every Wednesday.

#### Trackless Trolley Automobiles.

It has always been a puzzling question why the trackless trolley system, which appears to be in considerable vogue in Continental Europe, has never gained a foothold in this country. One of the reasons for this undoubtedly is the comparative lack of good roads in this country. The cost of installation of a trackless trolley line is necessarily relatively high, as compared with a gasoline motor service, as in addition to the rolling stock an electric power station and a transmission line are required. If in addition there is no suitable road for the vehicles to travel on, and the company are compelled to build their own road, or at least contribute to the cost of construction in consideration of a franchise, then a street car line would generally be preferred where there are sufficient prospects of building development, or the motor bus line where there is little immediate chance for growth of the traffic requirements. The field of the trackless trolley may be considered as intermediate

between that of the other two means of transit mentioned. The system is certainly intermediate between these two in respect to capital required.

Electric railways have been very thoroughly developed in this country; that is to say, there are probably as many instances where trolley lines are established in districts that are barely able to support them as there are of districts able to support such services which do not already have them. Where the transit requirements are limited the motor omnibus propelled by gasoline is generally chosen because of the very much smaller risks involved. Practically the only equipment necessary is the rolling stock, and this could be sold again with only a reasonable loss if the venture should prove a failure; whereas if a trackless trolley line were installed and proved a failure the loss would inevitably be quite heavy, as the transmission line would be almost a total loss, and the power plant would probably also have to be disposed of at a great sacrifice. The trackless trolley, therefore, seems to be best adapted for thoroughly settled communities where the volume of traffic can be fairly definitely determined in advance, and where the roads are in good condition.

In our leading article this week are described two of the systems on which a number of lines have been established in Germany and Austria. A third system, brought out in Italy, was described and illustrated in our issue of April 15, 1908.

## Extension of the Use of the Taximeter.

When the taxicab was first introduced in one of the largest American cities one of the first things which struck the general public was the apparently low rate for service as compared to the regular back rates. The charge of the transportation of as many as four persons from the residential district to the most frequently used depots seldom exceeded 40 cents, as against 50 cents per person in the case of cab rates. This naturally created quite a demand for the taxicab. A firm which had been in the auto renting business for some time, observing the popularity of the taxicab, fitted some of their machines with taximeters, and rented them either by the meter or by the hour, their rates by the hour being \$5 for the first hour (minimum), and \$4 for each succeeding hour. These machines were touring cars capable of carrying five besides the driver, and capable of making 15 or more miles per hour on the

average trip, including stops. Many of the older customers thought that they would prefer to hire the machines by meter, the rate per mile being 40 cents. A little reflection will show that an hour's use of the machine by meter costs the customer upward of \$6. The result is that the meters are now seldom used by this firm except for short distance trips.

As a matter of fact the taxicab is seldom used for trips of over 2 or 3 miles. Under these circumstances the amount of "dead" mileage becomes excessive, and to offset this a relatively high rate must be charged. To show what this dead mileage amounts to in regular taxicab work, one of the managers of a taxicab company in that same city stated that if the receipts of a cab came to 30 cents per total mile or more, the company felt satisfied. As this figure includes not only the initial charge, which is in excess of the regular 40 cent per mile rate, as well as the waiting time charge and extras, it can readily be seen that the "dead" mileage amounts to a considerable portion of the total. However, in the case of the longer trips the proportion of dead to live mileage is very much reduced. It would seem that to fit the taximeter to operate more equitably for long distance trips, it might be arranged to operate under a tariff which could be called the long distance tariff, having, let us say, a minimum rate of \$3 for 6 miles, and a rate of 10 cents per third of a mile thereafter, with perhaps the usual dollar per hour waiting time.

There is even now a considerable tendency to use taximeters on touring cars for hire. In many cases the instrument is placed in an inconspicuous place on the dash or foot board, or even in the tonneau.

The renting of automobiles for long distance trips is constantly growing, and it would therefore seem to be the part of wisdom for the manufacturers of taximeters to look into this matter with a view to adapting the instrument to differential tariffs for short and long distances respectively.

#### Rear Number Lamps.

The subject of the illumination of the rear number tag in such a manner that the number can readily be read in the dark by persons in the street is of late receiving considerable attention. In New York State at the present time the law requires the registration number to be carried on the lenses of the side lamps in figures

I inch high. This arrangement is not particularly satisfactory, because it necessitates either the painting of the numbers on the lamp glasses or the provision of stenciled number strips for both front lamps in addition to the rear tags, and besides the figures are necessarily so small that they are practically useless for identification purposes except when the car is stationary. Besides the proper place for the position of an identification tag is at the rear of the car, instead of at the front.

Other States, notably Massachusetts, following the example set by France, require the illumination of the rear number tag. This has in the past generally been accomplished by tail lights of the kerosene variety, which, in addition to throwing a red light to the rear, throw a beam of light sideways onto the number. It is self evident that the usual size of rear number tags, properly illuminated, serves much better the purpose of identification at night than the small front lamp numbers, and the only trouble which has been encountered with the above arrangement is that occasionally the lamp would blow out or jar out without the driver becoming aware of the fact. The driver of the car in such cases is liable to punishment for violation of the law, and a number of such cases have been reported from abroad. Though the breach of the law in such a case is unintentional, it is generally impossible to prove this. The risk of annoyance from this source has been greatly lessened by the introduction of electric rear lamps combined with number plates. These are not affected by gusts of wind or the jarring of the vehicle on rough roads, except in so far as the latter lessen the life of the lamp filaments, which for the low voltage employed is quite considerable. Any interruption in the supply of the current due to the source thereof would affect the side lamps equally, and would therefore immediately become apparent to the driver.

#### Engine Bonnet Fashions.

It is interesting to speculate as to whether a return to the sloping hood is among the possibilities. One manufacturer has brought out a line of cars which includes models with both the French type of sloping bonnet, with the radiator close to the dash, and the German type, with the familiar bonnet of rectangular longitudinal section, with the radiator closing its front. Another

manufacturer has announced a "twenty" with a typical French sloping hood.

It will be remembered that the sloping bonnet was a common feature of American cars until the contrary fashion of the square bonnet was set by a very famous make of German car. Immediately thereafter the hoods of all American cars assumed their present straight line profile, irrespective of whether there was a motor or merely gasoline and water tanks beneath them.

One of the best known American runabouts has adhered to the curved, sloping style of hood for many years, and there have been enough of certain French makes of cars in operation upon the streets of the large cities to keep the sloping bonnet somewhat familiar to the public.

Whether there is any actual æsthetic advantage of one type over the other, and whether "the curved line is a line of beauty" as applied to automobiles, is an open question. Taste in these matters is apt to be fickle and founded upon no defendable basis.

Certain it is, however, that the curved, sloping bonnet, with rear mounted radiator, possesses certain technical advantages in the increased accessibility which it affords to the motor, and the less road dust which is distributed over the engine and auxiliaries when it is used.

At the present time there seems less tendency blindly to copy the external features of famous or popular cars, and more willingness carefully and cold-bloodedly to weigh the advantages of differing features, from the engineering stand-point.

It may be that the instances above noted indicate that designers are beginning to consider with favor the so-called French type of hood, and that it may in the near future become a common feature of American cars.

#### The Doom of Macadam Roads (?).

During the past several years the lack of wearing qualities of ordinary macadamized roads under automobile traffic has been frequently discussed, and extensive experiments have been made all over the world with the object of developing systems of road construction which would insure roads able to resist the wear and tear of automobile travel. Foremost among these experiments have been those of our own national Government through the Bureau of Public Roads. It is now generally recognized that some elastic binder, such as tar or asphalt,

is necessary to secure the requisite wearing qualities, and further experiments should be directed toward the cheapening of the process of applying this binder.

The first definite step toward applying this method of road construction outside of parks and boulevards seems to have been taken by Public Road Commissioner Gilkyson, of New Jersey, who, as reported elsewhere in this issue, has approached the national Government with a proposal for the creation of a National Road Commission. apparently to follow up the experimentai work done by the Bureau of Public Roads, to devise methods for the application of the experimental results to road construction on a large scale. It must be understood that the chief objects of the experiments so far have been to determine the dustless and wearing qualities of roads made with different binding materials in various ways. What Mr. Gilkyson has in mind seems to be the development from these experiments of a system of road construction that can be recommended as most suitable for present road traffic, and of a set of specifications which can be made use of by local authorities in soliciting bids for road building. The main idea seems to be to combat monopo listic tendencies in this line of public work. which, if allowed to go unchecked, would be likely to have a retarding effect on the good roads movement.

We would like to point out, however, that the figures of cost mentioned in connection with the report can hardly be correct. It is inconceivable that a road with an elastic binding material should be cheaper to surface than an ordinary macadamized road. Perhaps the figures given for comparison refer to the prices for some of the special systems of road construction that have been developed privately, instead of to macadam roads.

The movement started by Mr. Gilkyson is of tremendous importance to motorists as well as to the general public living along much traveled highways, for if successful it would mean the practical abolition of the dust nuisance.

J. Fred Betz, 3d, of Philadelphia, has offered a prize of \$500 in either cash or plate for a small car race to be conducted by the Quaker City Motor Club in conjunction with the annual race in the Fairmount Park. The officials of the club are at present considering the proposal of holding this race, and opinion is said to be divided as to whether the race should be run simultaneously with the race for big cars or early in the morning before the race for big cars starts.

### Calculation of Chassis Springs-IV.

#### By David Landau and Asher Golden.

FACTORS OF SAFETY.

It is always of interest in any design to know to what extent the materials involved are stressed, and how safe our structure is. Factors of safety in spring design are limited by the flexibility. The desire to make a spring stronger by increasing the number of leaves or their width and thickness results in a harder spring than that required to give a predetermined flexibility. The only means of strengthening is to use a material of greater elastic elongation.

The fibre stress at any point of a cantilever is, as shown above:

$$S = \frac{Px}{Z}$$
.

If the cantilever is a simple leaf of width b and thickness t then  $z = \frac{b t^2}{6}$ . If it is

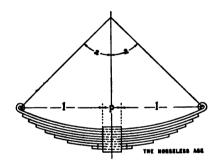

FIG. 2. (Referred to in Instalment II.)

made up of n superposed leaves of thicknesses  $t_1, t_2, \ldots, t_n$ , every leaf adds its own strength to make up the strength of the entire cantilever, that is, the spring. The fibre stress at any point is then

$$S = \frac{Px}{\frac{b t_1^2}{6} + \frac{b t_2^2}{6} + \dots + \frac{b t_n^2}{6}}$$

$$= \frac{Px}{\sum Z}$$
 (22)

To facilitate calculation we give below Tables VII and VIII of values of Z for leaves of widths and thicknesses currently employed in American and foreign practice.

In the examples which follow, of the application of equation (22), the leaves are assumed to be tapered so that the spring is of uniform strength. The bending moment may be taken at any point, provided the thicknesses of the leaves are taken at the same point. However, it is most convenient to take the bending moment at the spring seat; or, more strictly, at the spring centre, since at this point the leaves have their initial thickness.

Table IX shows the fibre stress and factors of safety of four actual springs having good riding qualities. The first two are made of an alloy steel having an elastic limit of 184,000 pounds per square inch, with an elastic elongation of 0.0065; the second two are made of a high grade open

hearth steel having an elastic limit of 142,000 pounds per square inch with an elastic elongation of 0.0052. Dimensions are in inches, loads in pounds and fibre stresses in pounds per square inch.

SEMI-ELLIPTIC SPRINGS USED AS RADIUS RODS.

There are a number of cars in which the radius rods are eliminated, the driving effort being exerted through the medium of the top leaf of the spring. We do not be-

•		.220		. 203
Width of leaves	2.25	2.50	2.00	2.25
Load on one end of spring	363	495	280	410
Fibre stress	43600	56250	41200	50500
Factor of safety	4.22	8.27	8.46	2.81

lieve there is any consideration to justify the employment of this arrangement owing to the additional stresses it imposes on the springs, which, as is seen from the table above, are already quite high. If the entire spring were solid, instead of being laminated, or if it were possible to make the top leaf quite thick without affecting the flexibility, there would be some reason for using the spring to perform the dual function of spring and radius rod.

But in order to make the spring flexible it is necessary to limit the thickness of the top leaf; further, mechanical considerations make it necessary to give all the leaves an initial curvature; hence we see that these two characteristics—the thinness and the initial curvature—put the top leaf in the worst possible form to resist the compressive action of the driving effort.

The stress imposed in the top leaf by the driving effort is not a negligible quantity. This will be shown clearly by an example. We will take for this purpose the second spring in the table above. The stress due to the downward load is 56,250 pounds per square inch. The stress due to the driving effort of, say, 100 pounds, considering the top leaf as an eccentrically loaded column with fixed ends, is about 8,400 pounds per square inch, making the total stress 64,650 pounds per square inch, and reducing the factor of safety from 3.27 to 2.85. This is a considerable reduction where the factor of safety is already low.

We will now take the same spring and thicken the top leaf to see its effect on the fibre stress and the factor of safety. We will increase the top leaf to 0.425 inch, but in doing this it must be observed that to preserve the same flexibility it is necessary to make the other leaves thinner. In other words the sum of the moments of elasticity must be the same in both cases. As seen from the table the spring has eight leaves of the thickness shown. Going to our table of moments of elasticity we find  $\Sigma$  (EI) to be 902,000. We now change the top leaf to 0.425 inch with a moment of elasticity of 447,500. To this must be added other moments to bring the sum to 902,000. In this way we get six leaves of the following thicknesses: 0.425, 0.284, 0.259, 0.238, 0.238, 0.220. The maximum stress due to downward loading is now 64,750, and the factor of safety 2.85. The additional stress due to the driving effort is now 4,350, making the combined stress 69,100 pounds per square inch, and the factor of safety 2.66.

#### OTHER TYPES OF SPRINGS.

We have discussed above but a single type of spring—the semi-elliptic—which we may well call the basic type. It is the type most generally used; all others are made up partly or entirely of semi-elliptics.

The object of employing other types is to get an equivalent long spring in a short space. We will not touch on these any more than to point out the method of finding their total flexibility. We will take first the three-quarter elliptic spring.

The flexibility of a spring is proportional to the cube of its length, the other dimensions being constant. It is, therefore, only necessary to add the flexibility of the half spring per 50 pounds to the flexibility of the semi-elliptic portion per 100 pounds. This will be clear from an example. If the flexibility of the semi-elliptic portion of a spring is 0.625 per 100 pounds, and that of the half spring is 0.286 per 50 pounds, the total flexibility will be 0.625 +0.286/2 = 0.769 per 100 pounds. The platform spring may be treated in the same way. This is practically a three-quarter elliptic spring with the half spring in the rear instead of on the sides.

The flexibility of a full elliptic spring is double that of a semi-elliptic.

#### THE WEIGHT OF A SPRING.

There is no formula for finding the exact weight of a leaf spring. A number of springs made by different manufacturers

The developed length of the master leaf is approximately

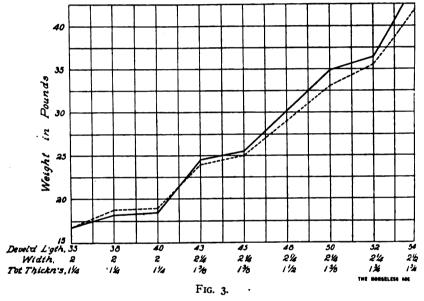

$$s=\sqrt{L^2+\frac{16}{3}h^2},$$

where h is the opening of the spring.

Too much faith should not be pinned to a formula before it is tried on a number of actual cases and found to be reliable. Unless this is done it is impossible to tell whether a formula will give right or wrong results.

The spring maker can determine the weight of his springs in a simple manner after weighing up a large number of springs which he considers good suspensions, and constructing a curve such as that shown (merely for illustration) in Fig. 3. The method of constructing the curve will be evident from the figure.

To find the weight of a spring not shown on the curve it is only necessary to observe

may have the same general form and dimensions, although the taper and grading of the leaves may be quite different and sufficient to make a marked difference in the weight. We can, however, in a general way, have a formula which will apply to all cases provided the proper constant is used for any particular make of spring. It is, moreover, possible to have a formula, involving a single constant for all cases, which will give fairly close approximations to the actual weight. In a general way, the weight of a semi-elliptic spring is  $w = KsbT, \dots (14)$ where K is a constant depending on the taper and the grading of the leaves, s is the developed length of the master leaf, b is the width of the leaves, and T is the maximum total thickness of the spring. To get exact weights for a particular make of springs, K must be determined experimentally by weighing up a large number of

Equation (14) will give fairly close approximations for all cases if we make K equal to 0.175 to 0.19.

that the weights of two springs whose developed length, width and total thickness are, respectively, s., b1, T1 and s2, b2, T2 are to each other as

$$\frac{s_1 b_1 T_1}{s_2 b_2 T_2}$$

If we assume  $s_1$ ,  $b_1$ ,  $T_1$  to be the dimensions of the spring whose weight  $u_1$  is to be found, then the denominator  $s_1b_1T_1$  is found from the curve. An example will make this clear. Let it be required to find the weight of a spring having a developed length of 46 inches, width 2 inches and total thickness 2 inches. From the curve we pick out a spring having dimensions close to these; for instance, the spring having a developed length of 48 inches, width 2½ inches, and total thickness 1½ inches. and weighing 29 pounds. The weight of the first spring is then

$$29 \times \frac{46 \times 2 \times 2}{48 \times 21 \times 11} = 33$$
 pounds.

As a check on this the weight may also be calculated from the formula.

Where the dimensions of the unknown

spring happen to be the same as those on the curve the weight of the spring is found directly without calculation. It may seem useless to construct a curve when a formula as (14) can be employed. The disadvantage of a formula is that it is only approximate; correction factors are necessary to bring the calculated weight close to the actual. A curve constructed on the basis of actual weights gives results whose deviation from the true weight is negligible.

The dotted curve shows the weights calculated from the formula. In some cases the calculated weights will be lower than the actual; in other cases they will be higher, especially for long springs. The two curves always show the defect in weight between the actual and the calculated values. Where a curve does not happen to be handy the formula will give fairly close approximations. As stated above, the curve shown in the figure is merely for illustration.

#### MATERIALS.

The materials generally used for springs may be classified under the following heads: Carbon spring steel, chrome nickel steel, chrome vanadium steel, and manganosilicon steels.

Under the head of carbon spring steel, the material usually employed runs fairly high in carbon, the carbon content being about 1 per cent. and manganese 0.3 per cent. This material will show the following characteristics, depending on the method of treatment:

Elastic limit	64,000 to 100,000
Ultimate strength	125,000 to 186,000
Elongation	8.5 to 9.5 per cent.
Reduction	15 to 16 per cent.

The chrome nickel steels usually have 0.37 carbon; manganese 0.34; chromium 0.85 to 0.95; nickel about 1.75 per cent, and the following characteristics, depending on the heat treatment:

Elastic lim	it		i.	4				*				86	5,00	00	to	13	5,000
Tensile str	ength		* 1					*		ì,		IOC	0,00	00	to	15	0,000
Elongation		 			.:	i.	×		.,			22	to	1	5 P	er	cent.
Reduction		.,									2	63	to	5.	3 P	er	cent.

Chrome vanadium steels, spring tempered, contain from 0.35 to 0.42 carbon; manganese about 0.75; chromium 1.22; vanadium 0.19; the characteristics are as follows: Elastic limit. 183,000 Tensile strength. 187,000 Elongation 14 per cent. Reduction 50 per cent.

Mangano-silicon steels have approximately 0.40 to 0.50 carbon; 1.50 to 1.90 silicon; manganese 0.70 to 1.00 nickel, about 0.50; sulphur and phosphorus each less than 0.035. This steel shows the following characteristics after treatment for springs:

This last material is most frequently used at the present time by foreign spring makers, such as Lemoine and Krupp.

The treatment of these steels is beyond the purpose of this article since no fixed instructions can be given for any class, and generalizations are entirely useless.

#### Louisiana Good Roads Convention.

"No one should oppose good roads any more than he should oppose public schools," said President A. C. Jackson, of the National Good Roads Association, at the Louisiana Good Roads meeting at the Hotel Grunewald on November 10. Every delegate agreed with President Jackson. The most important development of the meeting from a local standpoint was the booming of New Orleans for the next convention of the National Good Roads Association. New Orleans was suggested by President Jackson. Local men decided to start a movement immediately to get the convention for the city. Several hundred autoists, good roads enthusiasts, Governor Sanders of Louisiana, Mayor Behrman of New Orleans, and city and State officials attended. The meeting was enthusiastic and many good suggestions were put forth.

President Jackson, who went to New Orleans for the convention from Chicago, said he expected a larger attendance than was present. He said it was only one of the indications, though, that the public had not yet begun to realize the importance of the good roads movement.

President Charles A. Farwell, of the New Orleans-Baton Rouge Good Roads Association, opened the convention by introducing President Philip Werlein, of the New Orleans Progressive Union. President Werlein said the good roads movement was especially timely in Louisiana, because all Louisiana was discussing waterways now, and waterways would be nothing without good roads. He said the plan for good roads had been encouraged by Governor Sanders, and the people ought to give it their encouragement. He declared the question of building State owned roads would be brought up before the Legislature when it meets next May.

Mayor Behrman called attention to the benefits truck farmers would get from good roads. The city authorities, he said, favor improved highways. What improved streets are to a city improved highways are to a State, he declared. Major F. M. Kerr, State Engineer, spoke on the best material for good roads. He said the surfacing material was important. The best, though, was low enough in price to keep the cost of the roads within reasonable limits. Louisiana has quantities of gravel and other stone deposits, and these make the finest kind of material for road building. Roads in Louisiana, where the ground is extremely low, should be made as nearly as possible impervious to water.

Governor Sanders spoke of the model road started between New Orleans and Baton Rouge, the capital of the State. The road will be about 89 miles long. The different counties through which this as well all other "good roads" will pass tax themselves to construct and maintain the roads. The roads are built by

convict labor. Expert road builders for the work are furnished by the Bureau of Good Roads in Washington. After explaining this Governor Sanders said: "That Baton Rouge-New Orleans road must be built before the end of 1910.

#### A. A. A. Annual Meeting.

Speed regulations and the necessity for a more stringent observance of the rules of the road formed one of the most important topics of discussion yesterday (Tuesday) at the annual meeting of the American Automobile Association at the Hotel Belmont, New York. About fifty directors were present, the States most generously represented being New York, New Jersey, Massachusetts, Pennsylvania, Connecticut, Minnesota, Michigan and Ohio.

Oliver A. Quayle, chairman of the Legislative Committee of the New York State A. A., opened the subject of reckless driving, by presenting the following resolution:

Resolved, That the A. A. A. places itself upon record as being unalterably opposed to the unfair use of the highways by criminal and lawless operators of motor driven vehicles, and, furthermore, this national organization of automobile owners calls upon its various State associations to propose and secure the passage of laws which shall rid the highways of reckless and inconsiderate drivers even to the extent of revocation of licenses and jail penalties in proportion to the nature of the offences.

Mr. Quayle believed that automobile legislation would be one of the important matters that the incoming legislature at Albany will have to deal with, and he intimated that an automobile bill might be the first measure introduced.

A large part of the meeting was devoted to the presentation of reports by the officers and chairmen of the various boards. The new directors will meet today for the election of officers. Both the secretary's and treasurer's reports show that the national organization is in the best condition, numerically and financially, in its history. Treasurer H. A. Bonnell reported an approximate balance of \$13,000. Secretary Elliott's report showed that during the past year the membership has increased by 50 per cent., the membership being 25,759, representing thirty State associations. The total number of clubs affiliated with the A. A. A. is 225. Six new State associations were formed during the year.

President Lewis R. Speare's report dealt with the increasing interest in automobiling in the various phases throughout the country as shown by the success of the work done by the contest, legislative, good roads, and touring information boards.

A resolution was introduced by Chairman Charles Thaddeus Terry, of the Legislative Board, expressing the gratitude of the association for the successful efforts of the retiring chairman, Frank E. Hower, of the contest board; it was unanimously adopted.

### DESCRIPTIONS OF NEW VEHICLES AND PARTS.

#### Baker Electrics for 1910.

The Baker Motor Vehicle Company, of Cleveland, Ohio, after having successfully used the bevel gear drive on their larger type of cars for several years, have adopted this form of drive for all of their cars for 1910. Nearly all of the gasoline car manufacturers have abandoned chains in favor of the bevel gear shaft drive, on account of the cleanliness, simplicity of construction, protection against dirt and absence of lost motion in the latter. With the shaft drive there is no need for adjustment, and the constant lubrication insures long life to the parts. In an electric vehicle, transmission efficiency is, of course, of the highest importance, on account of the limited store of energy carried, and the Baker Company claim that after extended experiments they have succeeded in developing a shaft drive which excels in efficiency all other forms of transmission.

The bevel gear driven axle is of the semi-floating type. The entire axle housing is drawn from sheet steel, and all the bearings in the axle are of the ball type. The axle shafts and the pinion shafts are made of vanadium steel, heat treated. The differential comprises a three armed spider, and provision is made for a self aligning movement of the differential pinions. All of the gears in the differential and the rear axle driving set have plain teeth, and are hardened. All of the bearings are ground to size with the aid of limit gauges, to within 0.00025 inch.

The front axle hub is drawn from sheet steel, and the pressings are accurately machined and fitted with ball bearings. The front axle is tubular, consisting of semi-spring temper steel with drop forged yokes electrically welded to the tubing. The front axle spring seats are machined from steel and secured to the tubing.

The motor is of four pole design, series wound, and provided with an especially

large commutator. It is said to be larger than the motors ordinarily used in electric vehicles, and to possess electrical characteristics making it impossible to injure it by overloading, etc. The supply of current to the motor is regulated by means of a controller of the continuous torque drum type, which affords six forward speeds and three backward, all being obtained by means of a single

The controller is provided with a safety device which precludes the possibility of slipping into the reverse when shutting off the power. A special lock is now provided for the controller, on which a patent is pending. This lock is entirely mechanical and claimed to be very simple and reliable.

From the motor shaft the power is transmitted to a countershaft by means

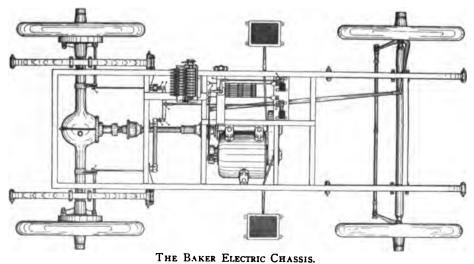

BAKER ELECTRIC FOUR PASSENGER COUPE.

lever. No special pedals or switches are used. It is claimed for this controller that there is no arcing or fusing at the contact points, and that it gives a gradual increase in speed, accompanied by a step-by-step increase in the current as the controller lever is moved from one position to that of the next higher speed. There is said to be no jerking motion either in starting or increasing the speed.

of a Renold silent chain provided with an eccentric adjustment and enclosed in an oil and dust proof case. The propeller shaft contains two universal joints. A novel feature is also found in the spring suspension, on which a patent has also been applied for. The front ends of the full elliptic rear springs are connected to the frame by a novel shackle, which is claimed to permit the omission of the radius rods and torque rod. The springs are provided with reamed bronze bushings, and the spring bolts are made from alloy steel, ground to size and provided with a special oiling atachment. The wheel base on the new models has been increased to 80 inches by moving the front axle farther forward and extending the frame.

The bodies of the 1910 models are more roomy and comfortable, and all cars are equipped with continuous fenders. The standard battery equipment for victorias and coupés has been increased from 24 to 28 cells of the 9 M. V. Exide type, which are connected in series for all speeds. All of the new cars are equipped with three brakes, two internal expanding brakes lined with Thermoid acting on drums on the rear wheels, and an emergency brake

being secured to the motor. All of the brakes are operated through steel rods, and the expanding brakes on the rear wheels are operated by one pedal through an equalizing lever.

It is stated that special care is being taken with the wiring of the cars, the wire sizes being easily large enough to carry the heaviest possible loads, and the entire wiring system being methodically arranged, and the wires insulated with the best rubber insulation to withstand acid, weather and mechanical strains. All of the mechanical connections are securely locked.

#### New Diamond Demountable Rim.

The latest addition to the line of the Diamond Rubber Company, of Akron, Ohio, is the new Diamond demountable rim. The Diamond people have been working on and perfecting this rim for a considerable time. Particular stress is laid by the manufacturers on the fact that any blacksmith can apply the rim to an ordinary wheel felloe without special equipment. There are but two main members to this rim, one being the ordinarily shaped rim which holds the tire casing, and the other a rim that is shrunk on to the wheel. The inside of the felloe rim, which may be called the inside band, is slightly bell mouthed to conform to the inside of the tire rim proper, and forms its support. The tire rim is held in place by eight bolts of special design. The

THE HORSELESS AGE

NEW DIAMOND DEMOUNTABLE RIM. head of the bolt is square. The part resting on the felloe rim band is milled to fit the inside edge of this rim and act as a locating clamp, which the lower portion of the head is drilled and fixed to the felloe by a wood screw to prevent turning. Around the outside between the two rims are located eight wedges which are held in position by nuts and lock washers on the bolts above mentioned. The bolts and nuts are of standard size and thread, so that if a nut is lost it can be replaced at any country hardware store. As the new Diamond demountable rim can be fitted to any automobile wheel of standard construction, practically all individual owners of cars, as well as manufacturers or dealers, can avail themselves of the convenience it offers. To apply a fresh tire one simply has to jack up his car, remove the old tire by removing the wedges, slip the valve stem of the fresh tire into place through the hole in the felloe, and the rim will slide easily to place on the wheel. Then the wedges are put over the felloe bolts and the nuts are screwed up tight.

#### The Great Western Thirty.

The Great Western Automobile Company, of Peru, Ind., have decided to turn out the coming season only one size chassis with several designs of body, instead of the several styles and sizes produced heretofore. The new car will be known as "Great Western 30," and will be fitted with either a five passenger touring car, a four passenger toy tonneau, or a roadster body. The standard color will be drab coach blue, with cream running gear.

The motor used is a four cylinder, four

spacious over the cylinder heads, and especially around the exhaust valve cages and outlets, where the heat is most intense. The water is pumped into the cylinder at the bottom on the left hand side of the motor and discharged from the top over the exhaust ports through brass water connections to the radiator. The centrifugal pump is gear driven through an idler gear from the crank shaft gear, with a coupling between the pump and the driving gear, and also between the pump and the magneto, which is driven from the same shaft.

GREAT WESTERN THIRTY.

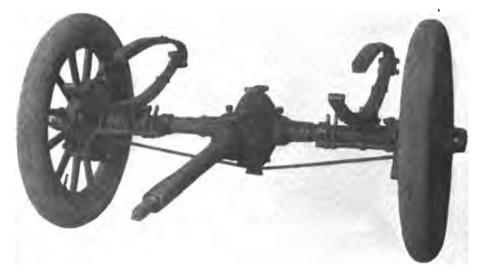

cycle, water cooled one of 4½ by 5 inch cylinder dimensions, with separately cast cylinders. It is made by the Model Gas Engine Company, of Peru.

The lubrication system is wholly self-contained, and consists of a reservoir below the splash basins, holding about two gallons of oil, which is claimed to be enough to run the car 600 to 800 miles. The oil is pumped by a gear pump, driven from the rear end of the cam shaft, by mitre gears, to the several main bearings. The over-flow from the bearings returns to the splash basins, from which it is distributed by the splash to the other moving parts.

The cooling is effected through a ball bearing, flat belt driven fan, a centrifugal pump and a vertical tube radiator. The water jackets of the cylinders are very This arrangement of couplings permits the removal of the magneto or pump without destroying any other parts of the motor. The fan is located on an eccentric stud for tightening the belt, and runs about two and a half times the motor speed.

The ignition is by a low-high tension magneto in connection with dry cell batteries for starting, both working through one distributor and a single set of spark plugs located over the inlet chambers. The cone clutch is covered with Raybestos, and has six engaging springs underneath to insure smooth engaging. Between the clutch and three speed selective transmission is located a double universal joint of the block and trunnion type, covered with a leather boot.

The transmission shafts are both carried

GREAT WESTERN REAR AXLE.

on Timken roller bearings. The propeller shaft is connected to the main transmission shaft through an enclosed sliding universal joint. The torque strains are taken by a swivel device bolted to the centre cross member of the main frame supporting the universal joint, the propeller shaft and the tube in which the shaft is enclosed. Within this tube, which is attached to the bridge casing of the rear axle, the propeller shaft revolves on two Timken bearings, one at the forward end and one at the rear next to the drive bevel pinion. Directly over the drive bevel pinion is an inspection plate which can easily be removed, permitting one to see the condition of the gears and differential. The differential, which is of bevel pinion type, is carried on Timken bearings. The rear axle tube ends are considerably heavier than on the former 30 horse power car and are parted vertically in the centre. The outer ends of the rear axle drive shafts are carried on roller bearings, while the hubs are keyed to taper seats. The front axle is an I section drop forging, and is much heavier than the one used on the 1909 model. The front wheels run on ball bearings. The front springs are semi-elliptic, 38 inches long, a slight increase in length. The rear springs are three-quarter scroll elliptic, instad of a full elliptic, as formerly, and are 42 inches long. The front portion of the lower member acts as the radius rod.

There are two sets of brakes, both operating on large pressed steel drums on the rear wheel hubs. The internal expanding brakes are the emergency brakes and operate through equalizers from a hand lever at the driver's right. The external contracting brakes are the service brakes, which also work through equalizers by pedal. The braking surface is very large, and it requires very little pressure to slide the rear wheels.

The sod pan for protecting the motor and transmission is carried well back to provide ample protection and is hinged on one side and provided with spring catches on the other, making it easy to drop for washing or adjustments. The steering gear is a worm and gear, with the gear a full wheel, allowing many adjustments. The spark and throttle control levers are set on a stationary quadrant above the 18 inch steering wheel.

PLAN OF WHITE GASOLINE TRUCK CHASSIS.

of channel section with a drop over the rear axle to give a low centre of gravity. The motor and transmission are carried on a sub-frame. The corners of the frame are reinforced with steel gussets. The wheels are twelve spoke artillery, carrying 34 inch tires with quick detachable rims.

While 56 inch is the standard tread, the car can also be supplied with 60 inch for Southern and Western roads. The gasoline tank is of galvanized sheet metal and located under the front seat; it holds 20 gallons. Each car is equipped with magneto, gas lamps, generator, two oil side lamps, one oil tail lamp, large tool box on rim running board, robe rail, horn, and complete set of tools.

#### The White Gasoline Truck

The White Company announce the a tion to their line of a gasoline truck ing a normal lead capacity of one a half tons. As shown in the ann illustration, the truck exhibits the neatness and simplicity of desi-White gasoline pleasure vehicle. gine used in the truck is the sta White gasoline engine with a bore o inches and a stroke of 556 inches. intake and exhaust passages form a tegral part of the engine casting, and valve stems and valve springs are pletely enclosed. The clutch is of leather faced come type; the transmi has four forward speeds, and the from the gear case to the rear axie means of a shaft. Both the engine an gear case are supported in the fran three point suspension.

In accordance with recent foreign patice the truck is fitted with postumatic teach rear wheel being fitted with two \$4\$ inch tires. The rear axle is so loo that when the truck is loaded practicall of the load is supported by the wheels, so that steering is rendered easy. The wheel base is \$144\$ inches; gear reduction ratio between the enshaft and the rear wheels on the didrive is 7 to 1. This truck chassis be fitted with any desired type of b such as platform, express, sightseeing of the such as the such

#### Gardner-Rix High Speed Air Compressor.

Among the recent additions to the of garage equipment in the market is air compressor that should meet the quirements of the average small garag well as of some of the larger ones. Class G compressor manufactured by Gardner Governor Company, of Qui Ill., is small in size, but large enough to ordinary demands. It can be set out of way, and is claimed to require little tention. The air is admitted through annular port in the air cylinder, at the let

SIDE VIEW OF THE WHITE GASOLINE TRUCK.

dle on the side.

#### GARDNER-RIX HIGH SPEED AIR COMPRESSOR.

end of the piston travel. The piston is 3 inches in diameter and has a 31/2 inch stroke. The air piston is of the trunk pattern, fitted with three spring rings, and is single acting, that is, it compresses the air on the upward stroke only. The discharge valve is a flat casting, seats on the top end of the cylinder, and is held in place by springs. The air piston comes to the extreme top of the cylinder on each upward stroke, so that there is no clearance, and the highest volume of efficiency is attained. The crank shaft, piston, piston rings and discharge valves are all ground to size. The piston pin is hollow, hardened and ground. The crank shaft and connecting rod are steel forgings. All bearings in the compressor are of white bronze and can be replaced when worn. The cylinder is water jacketed, and the jacket can be connected to an ordinary water line, allowing the waste to run into the sewer. The crank case is of the enclosed type, with hand holes on opposite sides for access to the connecting rod boxes. In these plates are fitted glass bullseyes so the operator can observe the oil level and the oil splash. The lower part of the crank case is filled with oil to such a height that the agitators on the crank shaft dip into this oil at every revolution, splashing oil to every moving part of the compressor. Oil pockets at the inside of each journal bearing keep these bearings supplied with lubricant. This compressor can be belted direct to the motor if desired.

#### Dover Sheet Metal Novelties.

The Dover Stamping and Manufacturing Company, Cambridge, Mass., have recently brought out several new gasoline funnels, a tourist oil and gasoline kit, and a garage gasoline filling measure.

One of the funnels is designed for the use of private owners, and is so arranged as to automatically shut off the gasoline in the funnel when the top level is reached. This is accomplished in the following manner: Within the funnel is a brass ball which is held up off the outlet hole when the funnel is in use, but as soon as the funnel is raised this ball drops back and covers the hole so that no more liquid can flow through. Those who have had experience with the overflow running all over the floor, seats and other parts of the car will appreciate this new device. The funnel is shaped similar to an ordinary funnel, but has a ring

for holding a straining chamois and a han-

The motorcycle funnel is made for the exclusive use of motorcyclists. It measures 5½ inches in height and has a 9½ inch opening in the spout to permit of fast pouring. It will fit in all tool bags, or can be easily carried in the pocket. It is copper plated, and has a very fine brass strainer to prevent dirt getting into the tank.

They have also added a gasoline funnel for garage use, which is furnished complete with chamois. The bowl is exceptionally large, drawn in one piece, having a large inside hoop with the chamois held firmly to the bottom. This hoop rests on two cross wires inside the bottom to prevent the chamois strainer from sagging. Outside it has a handle for convenience, and a large hoop on the base, which rests on the auto tank when in use and gives the funnel stability, and entirely does away with slopping from tilting. This funnel also has the ball shut off described above. While this funnel is made either copper plated or galvanized, the makers recommend the galvanized ones, because it keeps cleaner and never rusts.

The garage gasoline measure is made for both garage and autoists' use. This is made with 5 gallon capacity, of galvanized material, and has a seamless bowl on top, which prevents slopping when being carried full to the auto or lifted upon the running board to the tank,

The tourist oil and gasoline kit is a neat, compact and dustproof device for carrying extra oil and gasoline when touring. It is instantly attached and detached when desired. The outside box is made of heavier steel than heretofore, and the bottom is double seamed, instead of being soldered as formerly, the cover being heavily wired and the inside cans made of extra heavy material and furnished with an extension spout to facilitate pouring. A thick felt pad is placed in the bottom, on which the inside cans rest, thereby doing away with chafing. One of the two cans inside is for oil, the other for a reserve supply of gasoline, and both have a capacity of 11/2 gallons. The outside dimensions are 9x9x103/4 inches high.

MOTORCYCLE FUNNEL AND GASOLINE AND OIL KIT.

Livingston Radiator.

The Livingston Radiator and Manufacturing Company, recently incorporated with \$100,000 capital, have opened a factory at 312 West Fifty-second street. New York, where they are manufacturing the well known Livingston radiator. This radiator might be described as of the vertical, flat, staggered tube type, and while it is of the same appearance as the original true cellular radiator, it yet differs from it considerably in construction, as will be apparent from the following description. The radiator is composed of a series of long zigzag tubes 4 inches wide, or the full thickness of the radiator. These tubes are made of a special bronze and formed into shape in a specially constructed machine which forms the tube completely, leaving only the ends to be dipped and soldered for finishing. The vertical sides of these individual tubes are corrugated, which process not only lends strength lengthwise to the cell, but also adds radiating surface. It will be readily seen that the water entering at the top flows down through these several channels. and, being in a very thin film, cools quickly, owing to the fact that the film is exposed to radiation on both sides over this wide area. By studying the accompanying sketch the course of the water can easily be followed. At the bottom of these tubes is a reservoir from which the water is pumped into the water jackets of the cylinders. The housing of the radiator is composed of very few pieces, and is pressed into shape. The shapes into which these are formed lend greatly to the rigidness of the whole. The bottom is of one piece, the sides and top are of another, while there is a small piece added at the top, both front and back,

DOVER FUNNELS AND GASOLINE MEASURE.

which forms the sides of the top chamber. The top, sides and bottom, after being assembled together, are reinforced by strips of brass sweated into the corners. The radiator hanger brackets are not riveted directly to the radiator, but rather to plates insides the chamber over which are soldered brass sheets, keeping the rivets away from the water space. These hangers also extend well down below the lower bottom

LIVINGSTON RADIATOR.

curve. The tubes, after being assembled as a whole, are bound around the edges with brass strips, binding them into a solid mass which can be removed from the outer casing very easily. A hard rubber filler cap is used which has a brass lining in which the threads are cut for screwing on.

#### New Gilbert Specialties.

The Gilbert Manufacturing Company, of New Haven, Conn., have recently placed on the market several new extra tire carrying novelties. The principal one among these is a set consisting of three pieces, complete with straps, designed for carrying extra tires on top of limousine bodies, which will carry

GILBERT TIRE BRACKETS.

from one to three shoes of any size desired. Each member of this set resembles in a way an inverted shelf bracket, with the portion which is fastened to the body arranged to point to the centre, and is hollowed to fit the general contour of the casing, lying on the bottom. The other casings are, of course, piled on top of the first one, and the straps across the top prevent them from being lost.

Another novelty is an adjustable tire bracket which can be arranged to carry one,

TOP BRACKET OF GILBERT TIRE HOLDER.

two or three tires without altering the main arms or running board piece by simply substituting the different necessary fingers in the arm piece and running board base. The fingers can also be changed to suit the size of the tires. These brackets are recommended by the manufacturer especially for carrying demountable rim tires or spare wheels on account of their adjustable features. Both these new tire holders come in brass.

In addition to the above they are also producing two new styles of tire cases and a new tube bag. The tire cases are made for regular casings, and also for demountable rim and spare wheel types, and come in black enameled drill and black fabric leather. One style, known as the Gilbert Diamond, is snap button fastened, with a new inner guard protection strip, and is guaranteed to be water and dust proof. The other case is known as the Gilbert Star. This case overlaps at the tread portion, and fastens by means of four draw straps, three

STEP BRACKET.

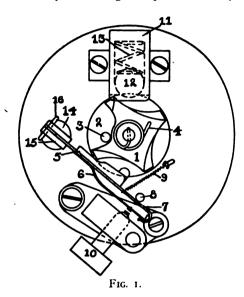

of which snap tight with buttons. This is also guaranteed water and dust proof.

The new inner tube bag is made from gum rubber cloth, with a draw string, and holds one tube of any size.

#### Rhoades Unit Spark System.

The Altemus Manufacturing Company, Forty-second and Chestnut streets, Philadelphia, Pa., who have been manufacturing ignition specialties for a considerable number of years, have recently come out with a new ignition system operating on the unit spark principle. The device comprises a spark generator and a distributor which are combined in a single unit of cylindrical form, measuring 23/4 inches in diameter by about 5 inches in length over all. The halftone shows the general view of the device, and the two line cuts illustrate the construction of the spark generating and distributing mechanism. Disc 2, carrying the post 3, is rigidly secured to the shaft A on a shoulder immediately above the phosphor bronze bushing E. A hardened tool steel cam I is fitted above this shoulder, free to move on the shaft, but held normally against post 3 by means of coiled spring 4. When the shaft moves forward each prong on the cam I is momentarily held by ball 12, which is actuated by spring 13 in the cylinder 11. During this interval

post 3 moves forward and pushes the cam over the centre of the ball, at which point the spring 4 becomes operative and snaps forward cam 1 a sufficient distance to allow another prong to wipe across tool steel block 5 on lever arm 7, causing the platinum spring tip 6 to make contact with the adjusting screw 10, thus completing the circuit. By means of spring 9 lever 7 is immediately drawn against post 8, thereby

quickly interrupting the current and producing a spark. The moment the contact is broken the high tension current generated in the coil passes through the terminal K to the brass ring I which encircles the distributing drum H and through fan J to one of the plug terminals L in the case G. The cams are so formed that on the reverse movement they cut under block 5 and raise lever 7 vertically out of contact.

It will be seen that the high tension distributor is located in the lower part of the casing and the contact or spark generating device in the upper part. All the bearings

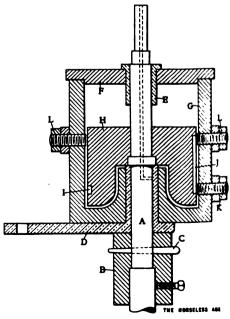

FIG. 2-RHOADES UNIT SPARK SYSTEM

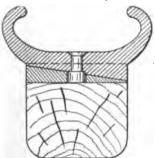

RHOADES UNIT SPARKER.

of the device are made of phosphor bronze. Among the advantages claimed for the system are simplicity, great current economy, case of starting by means of a button on the coil, absence of delicate adjustments, compactness, ease of fitting to any car, and absolutely correct timing. It is claimed that eight dry cells will last a season. The device illustrated herewith is intended for four cylinder motors. For two cylinder motors a similar device without the distributor is furnished, which can be attached like the ordinary timer.

#### Younie Demountable Rim.

To the list of demountable rims on the market has recently been added the Younie, manufactured by the O'Gorman-Younie Company, of Portland, Ore. To a common wheel is shrunk a ring or rim which has a lateral taper, and is secured in place on the felloe by tire bolts. The tire rim is provided on its inner circumferential face with a lateral taper, corresponding with the taper of the wheel rim, and is held in

THE HORSELESS AGE
YOUNIE DEMOUNTABLE RIM.

place on the wheel rim by means of two radial dowel pins, the heads of which are inserted into correspondingly located holes in the wheel rim, and by the heads of a series of clamping bolts. The clamping bolts are inserted through holes in the felloe of the wheel. The bolt heads are sufficiently large to overlap the rim of the felloe, and this arrangement would hold

the tire rim in place if, by accident, the dowel pins should be broken off, or even if the rim bolts connecting the taper rim to the felloe should get loose.

It will be noted that the tighter the tire rim is drawn on the beveled rim of the wheel the more rigid the wheel becomes as a whole. The rim is not wedged in place on the wheel rim, but is drawn upon the beveled face of the latter, and the tightening of the nuts on the draw bolts will move the tire rim up the inclined plane of the wheel rim. The tire comes off and is put in place as a part of the tire rim.

#### Triplex Radiator.

A new radiator of foreign design is being shown by Mr. Gilliard, of 39 Union square, New York city, agent for Megevet & Co., of Switzerland. The radiator is known as the Triplex, since it embodies a radiator, a pump and a fan all in one. Patents have been granted in Europe and America fully covering the several features and their combination. Owing to the peculiar construction of the Triplex it can be placed in any position on the car, in front, in the rear or in the centre, as may be desired. Owing to this fact, its light weight, and that it stirs up the air itself instead of depending on the air being forced through, as in ordinary radiators, it is especially adapted for use on racing cars, air ships and aeroplanes, and can also be used as a steam condenser. The radiating surface is composed of twelve fan blades radiating from a common centre, each blade being composed of eighteen copper tubes, with a distributing manifold at the centre and a collecting manifold at the outside which carries the water back to the centre again. The hot water coming out of the motor is led to the centre of the shaft of the

radiator, from which it is thrown by centrifugal force through the tubes of the fan blades from the distributing mani. fold, while a plain gear pump located in the centre of the radiator draws the water back from the collecting manifold through a single pipe to the reservoir which forms the circumfer-1 ence of the radiator. This reservoir can be made any desired The shaft is shape. a tube over a tube and is carried on annular ball bearings with double stuffing boxes on both ends, and can be driven either by belt, chain or bevel gears.

RAMBLER LAMP.

#### Rambler Special Lamp.

A distinctive feature of the new Rambler for 1910 will be a Rambler lamp of special design, as here illustrated. The top of the lamp is shaped to include the Rambler spare wheel in relief.

#### New Steering Wheel Watch Case.

This watch case is made of polished brass; it will hold an ordinary watch, and can be fastened to the nut in the centre of the steering wheel by simply tapping a quarter inch hole and screwing the case on with a screw furnished with the case. The bottom is cup shaped so as to fit tightly over any style of nut, or it can be screwed to one of the arms of the spider near the rim of the wheel. In either position it is always within easy sight of the driver. The cover or retaining rim screws off, which permits of the removal of the watch when desired. This device is sold by the Garage Equipment Manufacturing Company, of Milwaukee, Wis.

MEGEVET RADIATOR.

### COMMENTS AND QUERIES OF READERS.

# Wire Gauze Screens-Engine Braking.

Editor Horseless Age:

In the last issue of your valued paper (November 17), under the heading of "Comments and Queries of Readers," "A. L. M." asked regarding the result of inserting a wire gauze in the inlet pipe. In connection with this, the writer may say that, while conducting experimental work for one of the larger manufacturers, he had a few cases where the carburetor apparently gave rise to eddy currents which caused liquid gasoline to be carried with the vapor into certain cylinders only. By placing a gauze between the flanges of the carburetor and intake pipe the liquid particles were evidently broken up and the same quality of mixture delivered to each of the four cylinders.

That the gauze will in most cases prevent popping back into the carburetor there can be no doubt, but the writer never sees the statement made that "flame will not pass through fine wire gauze" without wishing to offer a word of caution. Upon several occasions he has had flame pass through gauze which was by no means hot. On one of these occasions it caused an explosion which sent his assistant to the hospital and narrowly failed sending him to his grave.

It may also be of interest to note that upon one occasion where a gaseous mixture was ignited above four thicknesses of gauze which practically touched each other the top three pieces were fused in places, and yet the fourth layer prevented further travel of the flame.

Regarding the query of "B. B. H." as to the advisability of throwing out the clutch when nearing "bad crossings or water breaks in the road," it might seem that he had taken the article advising the use of the engine for braking to mean that there was no occasion for removing the clutch under the conditions which he mentioned. He should remember that the clutch is withdrawn because, in going over a water break or bad crossing, there is a very sudden fluctuation in the rate at which the parts rotate. If the clutch is left in, the transmission parts are severely strained in trying to transmit this variation of speed to the engine. An excellent article concerning this point appeared in THE Horse-LESS AGE for March 20 and 27, 1907. Here it was shown that in traversing a "thankyou-ma'am" the propeller shaft will, if all the transmitting parts are rigid, be thrown as much as 50 degrees to either side of the position it would occupy if running at constant speed. If running with any other than direct drive, the variation in the position of the clutch would be increased in proportion to the speed reduction. With the clutch withdrawn the strain on the differential and parts is severe, but when the clutch is left in it must be that either the clutch or wheels must slip or some of the transmitting parts must bend or break. That they do not more often do the latter is really surprising, when one considers the stresses that the parts are called upon to withstand.

M. R. Wells, M. E.

### Substitution of Graphite for Talc in Tires.

Editor Horseless Age:

We note Mr. Max's communication in the November 10 issue of THE HORSELESS Age regarding the use of flake graphite in tires. We would advise that flake graphite be used in tires the same as talc, that is sprinkled in between the shoe and inner tube. We would also call attention to the practice, as pointed out by Mr. Max, of rubbing as much flake graphite into the rubber (both the shoe and inner tube) as possible. Perhaps the very best results would be obtained by rubbing the graphite into the rubber if this was done systematically and thoroughly, but, as this would take some little time and as good results are obtained by dusting flake graphite into the rubber, we recommend this method for severe conditions only.

Graphite is marketed in both the large flake and small (or fine) flake forms to meet various conditions. Where graphite is to be used on tires, we recommend the finer form.

Graphite is absolutely inert and is unaffected by acids or alkalies, and there need be no apprehension in regard to graphite injuring rubber. If one will examine a piece of rubber packing, it will be found to be filled with flake graphite which has been added in order to obtain the desired lubrication.

JOSEPH DIXON CRUCIBLE COMPANY.

L. H. SNYDER.

#### Responsibility of Repairers.

Editor Horseless Age:

I have been a subscriber for your paper for the last four years. I recall, under Legal Notes, a decision which was handed down from the Supreme Court of New York in relation to the overhauling of a machine. The garage people, having rendered the bill to the owner for the work, were unable to collect the bill, owing to the fact that the machine broke down shortly after the machine was repaired. Will you please send me the particulars of this suit?

W. H. Brown.

[The case to which you refer is undoubtedly that of Wyckoff, Church & Partridge, plaintiff, vs. August Heckscher, defend-

ant, which was decided by Justice Lauer in the Municipal Court of the City of New York, Borough of Manhattan, Third District, in November, 1908. The action was brought to recover the sum of \$267.12 for certain repairs made to an electric vehicle and new parts furnished for same. The understanding between the parties had been that the car should be put in good running condition. After the repairs were made the car was run to Huntington, L. I., only a short distance from New York city, when it was unable to proceed farther, and when it was attempted to recharge the batteries it was found that there was an open circuit, due to the breaking off of some of the leads on the storage battery plates. In his opinion the judge says: "I do not think it can be said that the plaintiff has reasonably complied with its contract to put the car in first class, or even in good running condition. So far, therefore, as the item of \$160, the contract work, is concerned, I have concluded that the plaintiff must fail in its recovery."—ED.]

#### Flat Wearing of Friction Wheels— Screens in Inlet Pipes.

Editor Horseless Age:

In your issues of November 17, page 569. "Student" asks for the advantages and disadvantages of the friction drive. Do you not consider the tendency of the drive wheel to flatten when trying to start in a tight place serious? A concentric clutch, if the wheels are positively locked, in slipping wears round, but a friction wheel flattens, the same as a locked car wheel, as you must be aware, and in the hands of an inexperienced driver who speeds up his motor and throws in his friction this happens quickly.

Referring to the inquiry of "A. L. M." on page 568, in the issue of November 17, in re gauze in the intake pipe, is not your recommendation, "Keep your carburetor properly adjusted," in the nature of the mushroom test, "Eat it and if it kills you it is a toadstool, otherwise a mushroom"? Is not the proper answer to advise a clean pan to avoid back fire danger, inasmuch as the only ready means of determining the mixture is to adjust down? I have had as many as four or five fires in a single week in cold weather in experimental driving, my carburetor being adjusted to run my motor clean when hot, then when I primed and flooded to start cold, back it came, sometimes a flame a foot long, outside the C. E. L. carburetor.

[The tendency of friction wheels to wear flat when slipped in starting from rest is covered by the lack of positiveness which we mentioned in our reply. If much trouble is experienced from this cause, we would

consider the fault to lie with the driver rather than with the system of drive. Your suggestion that we should have advised our other correspondent who inquired about the expediency of placing a gauze screen in his inlet pipe, to keep his pan clean, is rather off the mark. How do you know that he has a pan on his car? We do not admit that our advice is in any way a parallel to the suggested test for mushrooms. Our correspondent was not complaining about his car catching fire, but what he seemed to desire particularly was to gain power and save fuel. This we do not believe he can do by means of the gauze screen. The advice to keep the mixture properly dosed may be difficult to follow under certain conditions, but if the mixture is properly dosed and in a fairly homogeneous state, the screen cannot influence the fuel economy for the better. If a screen is to be used at all, we would recommend that it be placed over the mouth of the air inlet.—ED.]

### Applying Brake With Clutch In.

Editor Horseless Age:

In running down hill with the throttle closed and the spark retarded, is it proper, where the car speed increases, to apply the brake without throwing out the clutch?

W. L. P.

[We presume that the throttle on your car can be only partially closed, so that a charge still enters the cylinders and the motor keeps on exploding. In that case it would not be advisable to apply the brake while the clutch is in, as the motor would be working against the brakes, and the latter would have much more work to do in keeping the car from increasing in speed than if the clutch was first withdrawn. The best plan is to first cut off the ignition, when the motor will act as a brake and either hold the car in check itself or assist the brakes in doing this.— Ed.]

# Electric Lamps and Dynamo Voltage.

Editor Horseless Age:

I have a governed dynamo, storage battery and automatic cut-out system which I wish to install in a car to run electric lamps for the headlights while the dynamo is charging the battery. The instructions say: "When using electric lights with our system, connect same to battery terminals or wires leading thereto." Supposing a 6 volt battery to be used, what will be the voltage of the lamp circuit? Will it be 6 volts or will the dynamo, whose voltage may be as high as 15, raise it higher? Would it be safe to connect the dynamo up in place of the battery and turn the switch to indicate "Battery Volts" in order to find out the voltage of the dynamo at dif-J. T. L. ferent speeds?

[When the dynamo is connected to the battery and the battery is charging, the voltage at the battery terminals will be somewhat higher than when the battery is simply supplying current to the lamps, but it can never be very much higher, for the reason that an excess of several volts in the dynamo voltage over the voltage of the battery would cause the battery to draw a very heavy current from the dynamo, and this current would react upon the dynamo and lower the voltage. The fact that the dynamo generates as high as 15 volts when running free is not an indication that it will generate an excessive voltage when connected to the battery. You should not connect the lamps to the dynamo without having the battery connected, as the battery acts as a regulator.—ED.]

### Central Location of Control Devices.

Editor Horseless Age:

In your recent editorial on "Left Side Control" you overlooked my pet idea, viz., central control operable from either side. This solution is perfectly practical for light vehicles. Ever since motor vehicles have been marketed the buying public have been expressing a preference for one side or the other. It was to meet their requirements that I designed and made the one-hand central control a dozen years ago, which is pronounced by those who still use it "the handiest ever." Last year Holsman fitted some of his motor buggies with central control and is fitting more this year, I believe, while my buggyauts are being fitted that way in a rapidly increasing proportion. It is particularly liked by the ladies, for it keeps the control levers and pedals in the centre of the rig, where they do not catch and tear clothing as the driver dismounts. It is particularly advantageous in teaching the use of the auto, for the timid passenger will often take the control for a short while "just to see how it goes" when this can be done with little or no trouble. It tends to make drivers of every member of the family, and this is as it should be.

Along this line our legislation should be amended. In many States every driver must take out a license. Lack of licenses limits the use of the auto to one or two members of the family. Police purposes can be fully served by registering the vehicle only and making its owner responsible for all who drive it. Then any member of the family would feel free to use it. Makers want the markets increased, and the associations cannot do better than work for less restrictive legislation.

CHAS. E. DURYEA.

#### Estimate of Next Year's Production.

Editor Horseless Age:

Will you please give an estimate of the number of cars the following firms claim they will manufacture for 1910: Brush, Buick, Cadillac, Cameron, Chalmers, Ford, Hudson, Maxwell, Metz, Mitchell, Cleveland, Reo, Studebaker (20, 30, 40), etc.? Also the number of high wheel or buggy autos combined? Please state the number of firms

that will make cars for 1910, and the entire output that they plan on making? Please explain the correct method of estimating horse power? Some machines are rated at 25 to 30 horse power by makers, while the A. L. A. M. rating is 22.5.

Louis H. Hillis, M. D.

[We have circularized the above mentioned firms and find that they plan to produce cars in the following numbers for next year: Brush, 10,000; Buick, 40,000; Cameron, 1,000; Maxwell, 15,000; Mitchell, 6,000; Overland, 20,000; Reo, 8,000; Studebaker, 25,000 "Twenties," 15,000 "Thirties" and 1,000 "Forties." The Chalmers-Detroit Motor Company prefer not to make a statement. The others mentioned in your letter have not replied. We are not gifted with prophetic powers and are unable to state either the number of manufacturers who will make cars for 1910 or the number they will make. This applies equally to motor buggy manufacturers and production. There is no "the correct method" of estimating the horse power of gasoline motors. There are a considerable number of formulas and some of them give higher values than the A. L. A. M. formula, but there is not one that is universally recognized as the best or most nearly correct. Presumably the manufacturers arrive at the horse power of their motors by tests and not by formulas or estimates.—ED.]

# Centrifugal Action on Charge in Rotary Cylinder Motors.

Editor Horseless Age:

I notice in your November 10 issue, page 537, that you state that the gasoline has to enter the cylinders of the Gnome motor against centrifugal force. Will you kindly explain how this can be possible? The motor not being shown in section, it is extremely difficult to understand your explanation.

W. F. COOPER.

[It was our correspondent who stated that the fuel had to enter the motor against centrifugal force, and the statement was not made by us. We presume that what our correspondent referred to was that since the inlet valves are in the head and the suction is from the outer end of the cylinders inward the charge must flow against the action of centrifugal force into the cylinder.—ED.]

#### Benzol.

Editor Horseless Age:

In a report on some fuel tests in THE HORSELESS AGE some time ago it was mentioned that benzol could be bought at 5½ cents per gallon by the drum. Kindly advise me where it can be obtained, as I am interested in fuel tests, and especially in new fuels.

CHAS. E. LESHER.

[We believe that you are mistaken in regard to the price mentioned in connection with benzol. In an article by Mr. Clough on "Some Road Tests of Cheap Fuels" (Vol. XXII, p. 544), it was stated that crude benzol sold at 12½ cents per gallon in the drum. Mr. Clough informs

us that he thinks this figure has been quoted for benzol in large quantities to gas companies for the enrichment of their gas. One of the largest manufacturers of benzol is the Barrett Manufacturing Company, of Philadelphia. Eimer & Amend, a large New York wholesale drug house, quote a price of \$8.50 for a 10 gallon can. This latter is the refined product. The crude benzol can be bought considerably cheaper.—Ep.]

# Left Hand Control Extensively Used on Electrics.

Editor Horseless Age:

Notice with interest your article on page 559, November 17 issue, regarding left hand control. There is one point that most of the men interested in this subject have overlooked. That is, practically all of the electric machines manufactured today have been driven from the left hand side. This was done so as to permit the operator to use his right hand in steering the car.

In no instance have the complaints to the manufacturer of electric machines been serious, and there has been very little trouble in the operators locating the curb or any other object in the road. Personally I believe that the steering on the left hand will ultimately be the most popular.

A. C. Downing.

### Specific Gravity of Denatured Alcohol Solution.

Editor Horseless Age:

Will you kindly let me know what specific gravity should be used in a solution of denatured alcohol and water to prevent freezing in regions about New York city?

O. H.

[A denatured alcohol solution of 0.95 sp. gr. will stand zero weather, and gives undoubtedly sufficient protection, except in long continued spells of severe cold. A solution of 0.925 sp. gr. will withstand 15 degrees below zero Fahrenheit.—Ep.]

### Cubical Horse Power Formula. Editor Horseless Age:

Please inform me through the columns of your periodical how the horse power of an engine is found when the capacity in cubic inches is given, as, for example, in the recent account of the Atlanta races. M. B.

[The way stock cars are generally rated, one horse power is produced for each 10 cubic inches of piston displacement, as an average; consequently, dividing the piston displacement by 10 should give you the approximate horse power. This rule gives the same result as the A. L. A. M. formula when the stroke is about 5 inches. If the stroke is less it gives smaller values; if more, larger than the A. L. A. M. formula.—Ep.]

Both the National Association of Automobile Manufacturers and the American Motor Car Manufacturers' Association held meetings in New York Tuesday.

# Worcester Endurance Contest December 17.

The Worcester (Mass.) A. C. has fixed the date for its annual endurance run for December 17. The rules will be practically the same as last year and will be issued in a few days. An arrangement has been made with the Worcester Polytechnic Institute for making tests at the laboratory of the institute to determine the horse power developed by the cars at different speeds and on different grades, the drawbar pull, etc. The following technical committee has been appointed: C. M. Allen, chairman; David L. Gallup, in charge of the laboratory tests, and I. C. Harvey. Institute students will act as observers.

#### Sixteen Hundred Mile Winter Run.

A Jackson car, driven by E. P. Blake, of Boston, and Charles Percival, of New York, made a trip from Jackson, Mich., to Bangor, Me., last week in 123 hours' continuous driving. The distance is 1,614 miles, and was covered last year by the same parties in two days, twelve hours, and forty-five minutes more than the new record time. The car carried 300 pounds of baggage and supplies.

#### Free Air at Tire Stores.

The Fisk Rubber Company some time ago conceived the idea of equipping all their branches with air boxes, which are placed on the sidewalk close to the curb, for the convenience of motorists. Upon opening a box a rubber tube is found, which is attached to the tire valve, and a lever and scale regulate the amount of pressure to which the tire is inflated. Keys to these boxes are furnished free to motorists upon request. At the New York branch the air is supplied from a rubber tube at the rear entrance, owing to the fact that the city will not permit encumbrances on avenue sidewalks, and also forbids making repairs or adjustments on the sidewalk.

#### Independent Oil Concerns Fight Award of Milwaukee Contract to Standard Oil Company.

Independent oil interests, headed by the Wadhams Oil Company, of Milwaukee, Wis., are attacking the action of the Milwaukee Board of Public Works in recommending to the Common Council that 500,000 gallons of asphaltum oil be purchased from the Standard Oil Company. The Standard's figure of .0295 per gallon is considered too high, and the independents ask that the contract be awarded by means of competitive bids. The attack will not delay the extensive scheme of treating Milwaukee streets and parkways with the dust laying preparation.

#### Alumaloyd Sheets.

A substitute for sheet iron and steel for use in the construction of automobile bodies, fenders, etc., has been brought out by the Stark Rolling Mill Company, of Canton.

Ohio, and is marketed under the name alumaloyd. Steel and iron have their drawbacks owing to the difficulty found in giving either a perfect lasting finish. The texture of the metal is such as to readily take a finish without pumice stoning, filing or sandpapering, or without the use of rough stuff, which should be an item in the cost of production. The metal comes in sheets and can be drawn, stamped, pressed, double seamed and soldered, and being scaleless and rustless it seems to be certain of a future in automobile construction.

#### Bituminous Roads for New Jersey.

Col. Gilkyson, State Road Commissioner of New Jersey, announces that in future the new roads of that State will probably all receive a bituminous pavement, instead of the heretofore common macadam pavement, which is claimed to be unequal to the wear and tear of automobile traffic. The State now has 85 miles of bituminous road, and specifications have been prepared for 13 miles more. It is claimed that the cost of the bituminous pavement is from \$1.15 to \$1.50 per square yard, as compared with \$1.90 to \$2.50 for macadam pavement. Col. Gilkyson is urging the Federal authorities at Washington to appoint a paving commission to supervise road construction on this system so as to avoid conflict with any of the patented road making processes and permit of open bidding.

#### Goodyear Tire & Rubber Company to Handle the Doolittle Demountable-Detachable Rim.

The Goodyear Tire & Rubber Company have secured control of the Doolittle demountable-detachable rim, which was described in our issue of March 10 last. This rim will take any type of quick detachable or clincher tire. It has been used in many of the important contests of the past season. In the Brighton Beach 24 hour race two of the contesting cars were equipped with Doolittle rims, and fifty-four tire changes were made, some of these in the remarkable time of 28 seconds, it is claimed, and in one case four tires were changed in the total time of 1 minute 7 seconds. Negotiations for the exclusive sale of the rims were concluded about a week ago, and the rims will shortly be on sale at all the company's branches and agencies. The rim was invented by Dr. Perry E. Doolittle, of Toronto, Canada, who also invented a number of other well known auto accessories. These rims can be fitted to any car in a few hours, the old wheels, felloes, casings and tubes being used.

The contract for carrying the mails by automobile between Newport News and Old Point, Va., for a term of years has been awarded to Frank L. Small. Mr. Small will leave Newport News at 7:15 a. m. and will arrive at Newport by 9:40, while the mail does not now arrive there before 11 o'clock.

### The International Show at Olympia, London.

eighth international automobile exn, which opened in the Olympia Build
ondon, on November 12 and closed
iber 20, bore, perhaps, the strongest
utional character of any automobile
ever held, owing to the fact that the
i manufacturers decided to hold no
at Paris this year. While the Olymow always included many products of
ontinental manufacturers, it never benjoyed the distinction of being the
bal exhibition of the year, not even
its opening preceded that of the
Salon.

epresentative international show has estimable educational value to manuers and designing engineers, as well he general public. The Olympia show ear was no exception to this rule, new original details of body, motor ear construction were shown, as well blications of old and well tried (in lines) principles.

n the layman's standpoint the most teristic features of the exhibition as le were the new style of torpedo body e remarkable decrease in motor power. in America the high powered car is still holding its own in competition with the popular priced low powered car, largely by reason of our present road conditions, the foreign manufacturer has been reducing the motor sizes until a 4 inch bore in a four cylinder motor practically represents the largest size motor used, and nearly every manufacturer had on exhibition a standard model of 85 mm. (3.4 inch) bore or less. Particularly noticeable was the absence of large four cylinder motors, these having been replaced with sizes of smaller cylinder dimensions, and the larger and heavier touring cars of the highest prices were invariably equipped with six cylinder motors.

Among the changes in motor construction the increase in the number of designs of piston valve motors was perhaps the most prominent; while there were several motors with piston valves on exhibition which owe their origin to the "Silent Knight," they all differed from the latter in having valves located similarly to the mushroom valves which they replace. It is understood, however, that several of the well known firms have taken up the "Knight" patents and intend to produce a motor along these lines.

The torpedo bodies on exhibition-and

nearly every booth showed some form or other of this type-are constructed very low, with the seats set very low in the body. This style body, with a bulging, rounded stem, is especially popular in France. One valuable feature of these bodies is the side doors in front, which are surely a protection to the driver. The side door in the driver's side is generally a dummy. On some of the cars the door is outside the operating levers, in some between the speed central lever and the emergency brake lever, and in still others it is inside both sets of levers. In connection with the above body come the adjustable seats and footboards.

The tendency to slope the tonneau seat proper is growing remarkably, while in some instances the driver's seat is also sloped. This, with a foot rest adjustable to any desired position, surely is a step in the direction of comfort for the occupants of the car. Several styles of adjustable seats for long wheel based cars, where there is plenty of tonneau room, were shown, and some particularly adapted to short tonneau cars. The most noticeable of these several seats was one which when not in use as a seat

GENERAL VIEW OF OLYMPIA MOTOR SHOW.

was convertible into a sloping foot rest, and especially adaptable to a short tonneau.

The two cycle motor has evidently not developed as rapidly abroad as one might expect, as but one new make was added this year to those formerly shown.

In clutches and transmissions very little change was observable. The principal tendency, however, is to return from the four forward speed, with direct drive on third, to the simple three speed forward type. There are one of two instances where a double direct drive is used (i. e., a direct drive on both the third and the fourth speeds). This is done by using two sets of bevel gears in the rear axle.

The Olympia Show of 1909 will go down in history as the first great exhibition at which the front wheel brake applied to standard stock chasses was shown to the public. Such brakes were shown on Sheffield-Simplex, Crossley, Arrol-Johnston and Thames cars. The principle of front wheel brakes has been much discussed in England for some years, and solutions of the problem have now evidently been reduced to practical form. While the stopping power of front brakes is no greater than that of the rear brakes, it is claimed that the tendency to skid is practically removed, and the avoidance of skidding by far overbalances the added complication in importance. This does not imply that the tires adhere any more firmly to the roadway, but rather that when the brakes are applied to the rear wheels the front wheels frequently happen to be turned slightly, and, the rear wheels being blocked, continue to travel in a straight line, while the front wheels find it easier to follow their rolling path; this if allowed to proceed develops into a "skid." The reason that the applying of brakes on the front wheel does not cause sideslipping is that when the front wheels slip the vehicle continues in a straight line.

A very large proportion of the cars this year were equipped with steel wire spoked wheels. Another noticeable fact was that all sizes of cars were equipped with magnetos, from single cylinders to sixes.

The worm driven rear axles show some improvement in the shape of the worm. Heretofore a straight worm has been mostly

Adams Chassis, Replecting American Ideas.

used on types of this kind, but a worm that conforms to the circumference of the worm gear, and thereby giving greater bearing surface, seems to be gaining in favor. This type of transmission has been used for several years on light cars by some of the foreign makers, but has been looked upon with disfavor by others who claim that the bearing surface was too slight and that the rubbing motion entailed short life. This system has been tried and abandoned by some manufacturers, but taken up by others of wide reputation. The principal objection seems to be that it is impossible to start quickly or pick up speed rapidly.

What is claimed to be the largest private car in the world was also shown. This was specially built for Mr. Du Cros, the well known promoter, at the Austin works. It is a motor "caravan," and has a well equipped kitchen, behind a salon which serves alternately as day and night apartment of the passengers. The chauffeur is to sleep on the roof under a tent.

It is needless to say that the United States was better represented at the show than

ever before. Some of the American low priced cars are also being copied by the foreign makers.

"En bloc" motors were not so much in evidence, but more unit power plants are being used than last year.

### Old Construction Idea Revived Abroad.

The French and English automobile papers have recently described a new so called frameless chassis, which has been placed on the French market under the name of Simplicia by the firm of Lacoste & Battmann, 15 Rue Danton, Levallois-Perret. This car employs a unit power plant, the change gear, clutch and crank shaft hosings being all bolted together, and this unt is connected by a large diameter tube with the driving gear housing of the rear axe The front axle is not unlike the Siraire-Naubin, being spring supported from the wheels through a semi-elliptic cross spring The forward end of the power unit is onnected to this front axle, and the rear ent. of course, is supported through the layer tube above referred to upon the rear and without intermediary springs. As far as the arrangement of the power plant and rear axle is concerned, a very similar construction was exploited in this country some for years ago by the Phelps Motor Car Conpany, of Stoneham, Mass., which company has since passed out of business.

Among the advantages claimed for this new French construction is the appearant of simplicity due to the abolition of the frame, with its numerous control consections. The control members are mounted directly upon the casings. The assembly is claimed to be perfectly rigid and non-deformable within the limits of operation of the vehicle, and there are no universal joints used, which results in an increase in the transmission efficiency. All of the camp are machined on the lathe, which insure perfect concentricity. The body is secured to the running gear at three points, and can be readily removed. The 12 horse power chassis, which has cylinders of 34 inches, weighs 1,110 pounds without both and tires, which is considered to be very light by the manufacturers.

### AUTOMOBILE LAW AND LEGAL EVENTS.

#### Massachusetts Taximeter Law.

Below will be found the text of the Massachusetts law relating to the inspection and sealing of taximeters. This puts the taximeter and even the odometer, when used for the calculation of fare, in the same class as scales, yardsticks and liquid and dry measures, except that the sealing and inspection of these instruments is in the hands of the State and not the local authorities. This obviates the necessity of inspection in more than one town and does away with confusion as to jurisdiction. This law simply places the examination of the machines as to their accuracy in the hands of the commissioner, but does not interfere with the right of the local authorities to make such regulations as they may deem fit as to rates of fare, etc.

MASSACHUSETTS TAXIMETER INSPECTION LAW. Section 1. The provisions of chapter 62 of the Revised Laws relative to the testing and sealing of weights, measures and balances shall apply to all taximeters and other forms of measuring devices which are used upon vehicles for determining the cost of transportation; provided, that the testing and sealing of such devices shall be performed by the commissioner of weights and measures of the commonwealth and not by the sealers of weights and measures in cities and towns. All such devices shall be tested as to the correctness of measures and values indicated by them, and the commissioner of weights and measures is empowered to make such rules and regulations as he may deem necessary to insure accuracy in the use of the said devices.

Section 2. The commissioner of weights and measures shall seal the said devices when tested and found to be correct, and shall mark, condemn or seize the same if incorrect, in accordance with the provisions of said Chapter 62 applicable to weights, measures and balances, and all penalties imposed by said chapter for violation of the provisions thereof relative to weights, measures and balances shall also be applicable to the said devices.

Section 3. The commissioner of weights and measures shall collect a fee of \$1 for each device sealed under the provisions of this act, and such fees shall be paid by him monthly into the treasury of the commonwealth.

#### Rear Light Regulations.

Police Commissioner Baker, of New York, announces that he will recommend to the Board of Aldermen the passage of an ordinance requiring the carrying of a new kind of tail light on automobiles, so arranged that a metal slide in the form of stencil containing the registration numbers of the regulation size can be fastened

across the face of the light. In that way an owner could have separate slides for the different States, and thus always display his local number. Under the present law it is necessary to paint the owner's number on the lenses of the lamp, but the numbers are too small and the paint soon wears off. The Board of Aldermen, however, have no authority to pass such an ordinance, as it would conflict with the State law.

### Special Session May Clear Indiana Road Law Tangle.

Governor Marshall, of Indiana, has received a number of requests from different parts of the State for a special session of the Legislature to straighten out the road law tangle. Recently the Supreme Court held that the laws under which road construction was met by issuing bonds were invalid and road work all over the State has been stopped. It has been decided that bonds already issued under the laws are valid, but contractors fear that bonds issued in the future might be worthless. They also believe it would be practically impossible to dispose of road bonds in view of the present situation. The Governor has not indicated what he will do in the matter.

#### Road Hog's Punishment Confirmed.

An important precedent has been established by the Circuit Court at Racine, Wis.,. in affirming the verdict of the municipal court in the case of Henry Plow vs. Ernest Nowak for malicious obstruction of the highway. Mr. Plow is a member of the Mitchell Motor Car Company, of Racine, and while driving his touring car from Milwaukee to Racine last summer came upon Nowak and a companion in a horse drawn rig. Mr. Plow asked them to give him room to pass, but Nowak kept the middle of the highway for more than an hour, keeping up a snail's pace. There were steep embankments on both sides of the road, precluding possibility of passing under these conditions. Nowak was fined \$10 in the municipal court, but appealed, and he now loses again.

### State Law Rights Must Not Be Abbreviated.

Judge William B. Broomall, of Media, Pa., has handed down a decision to the effect that municipalities in Pennsylvania have no authority to pass regulations abbreviating the rights granted automobilists under the State law of April 27 last. The opinion was given in an appeal taken by Elmore F. Taylor from a conviction by a justice of the peace in Swarthmore, who had fined him \$5 and costs for disobeying a

borough ordinance requiring headlights to be displayed between sunset and sunrise. The State law requires the lamps to be burning only from one hour after sunset to one hour before sunrise.

#### Legal Notes.

The Locomobile Company of America have brought suit for \$2,000 damages against the Connecticut Company, as the outcome of an accident in New Haven on October 19 last, in which two of the company's 1910 model cars that were being tested out by road testers were damaged through a rear collision with a street car. It is alleged that the two cars were being driven one behind the other in College street, when a street car came up from behind and bumped into the rear one of the two automobiles, and the latter in turn dashed into the forward one, whereby both were almost entirely wrecked.

Harry A. Snow has brought suit for \$10,000 damages against the village of Excelsior, Minn., alleging that last summer his automobile ran into the lake near Solberg's Point. The county commissioners built a new bridge across the channel, and the village changed the road in consequence. A turn had to be made to get on to the bridge, and the old road led directly into the lake. Mr. Snow drove over the road and, not knowing of the turn, went into the lake.

The case of the Matheson Company of New York City, now the Palmer & Singer Manufacturing Company, against the Matheson Motor Car Company, of Wilkes-Barre, Pa., involving an amount of more than a hundred thousand dollars, came up in the Federal Court in Scranton on November 22. The Palmer & Singer concern formerly represented the Matheson Company in New York City, and they allege that the Matheson Company sent to them cars which had not previously been tested out, as was called for by the contract, whereby, they allege, their interests were seriously injured.

#### **Business Troubles.**

A petition asking that the Indestructible Wheel Company, of Lebanon, be declared a bankrupt has been filed in the United States Court at Indianapolis. The creditors are largely publishers of trade publications. Mayor Hoy, of Lebanon, is one of the principal stockholders in the concern, in which about \$70,000 has been invested

George P. Rowell has been appointed receiver for the Goshen Tire and Rubber Company, of Goshen, Ind., and the firm will probably be wound up. They manufacture a cushion tire, and have been in business about a year.

#### The New Orleans Meet.

Unforeseen events marred the opening of the New Orleans Automobile Club's meet at the Fair Grounds November 20 and 21. In the first place, Barney Oldfield and Kirscher were unable to race on account of the non-arrival of their cars. The cars were shipped from San Antonio on a fast train, but 50 miles from New Orleans the cars were placed on a local, and they only reached their destination late in the afternoon. Then mishaps and withdrawals in various events made it necessary to further rearrange the program. The National car, driven by John Aitken, cracked a cylinder and was unable to enter the 50 mile race, which would have made it the best race of the afternoon.

No records were broken, though the track appeared as fast as it was in February, when the last meet was held. None of the winners was pushed very hard though, and most of them wanted to nurse their cars for the second day's racing. Ray Harroun was the particular star of the first day. Piloting a Marmon car, he entered four races, captured two firsts and two seconds, including the 50 mile race. Numbers of auto parties were out at the Fair Grounds, and about two thousand people were present. The track was well oiled and dustless, and everything was primed for a good day of racing.

The first event was a match race for 5 miles between Tilford Cowell, of Montgomery, Ala., who holds the Southern amateur championship, and A. Benzie, of New Orleans, in an Oldsmobile. Cowell won easily in 7:12.

The second was a 20 mile stock car race, for cars of 301-450 cubic inch piston displacement. The prize was \$50. There were three entries: Harroun, in a Marmon; Aitken, in a National, and Basle, in a Renault. The race in the beginning was a nip-and-tuck affair. The cars were well bunched for the first 5 miles. At that

distance Basle was leading by a car length, having made 5 miles in 5:40. The first 10 miles was made in 10:55. At this point Harroun, in his Marmon, was leading by a length, the Renault having dropped back a quarter of a mile. Harroun kept his lead, and finished in 21:282-5. Aitken, in his National, was second, and the Renault brought up in the rear.

The third event, open only to Louisianians, was for a trophy put up by Governor Sanders. John Walker, of New Orleans, in a Buick, carried off the honors. He finished the 5 mile run in 36:48 3-5. Clarence Murphy, in his Ford, finished second. He started out well in the rear and adhered religiously to the city speed limit. Four cars started. Two fell by the wayside, but Murphy plodded on. His persistence caused lots of enthusiasm, though, and he was given a cheer when he finished.

Five entries were in the fourth race, a to mile handicap. Harroun, in his Marmon, and Aitken, in his National, were handicapped at scratch. Basle, in a Renault, was given 30s.; Colwell, in a Chalmers-Detroit, was given 45s., and Walker, in his Buick, was allowed 1:10. Basle soon got the lead and kept it. He won in handy fashion in 10:52. Harroun was second and Aitken third.

As the crowd began yelling lustily for Barney Oldfield to show that he was really at the track, he climbed into Harroun's car and took it around the track for a mile, clipping the distance in 1:04.

A 5 mile free for all event, the fifth race, was between Basle in a Renault, Aitken in a National, and Harroun in his Marmon. The race was from a standing start. Aitken won in 5:251-5. Harroun was second.

The 50 mile race was reserved for sixth place. There were two classes, Class 2 for cars of 301 to 450 piston displacement, and Class 4 for cars of 161 to 230 piston displacement. In the first named class Basle,

in a Renault, and Harroun, in a entered. In Class 4, Colwell, in a 6 Detroit, was the only entry. T were \$50 to the winner and \$25 the first in each class.

At the end of to miles, which in 10:53, the Marmon led. Rer second and the Chalmers-Detroit third. On the eleventh mile the tank of the Chalmers-Detroit ca a leak, and Cowell stopped to he paired. While making the sixte the Renault blew a tire and was The Chalmers-Detroit started miles behind the leader, the Marn Marmon had a clean field and wa as smoothly as clockwork, never an instant the whole time. It ma miles in 27:09 1-5, 35 miles in 38:1 40 miles in 43:50 1-5. The 50 mile in 54:06 3-5. The Renault was th forty-first mile and the Chalme on its thirty-fifth mile. The Cha troit had to stop again because trouble, and when the Renault fi race Referee Wagner called the The Chalmers-Detroit was just thirty-ninth lap.

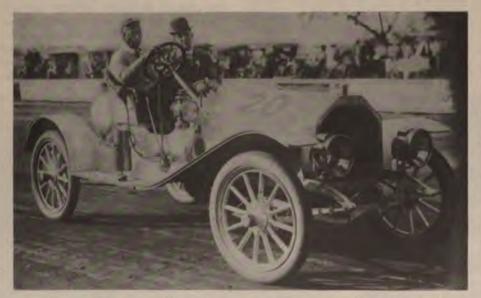

The second day's racing was be the first. More cars were enter time was made, and there was attendance. Barney Oldfield, deadrivers, succeeded in breaking the ord broken during the two days' lowered the Fair Grounds' track a mile. He made the circuit in a flat, clipping off one-fifth of a see the record established last Fel Ralph De Palma. Oldfield's big seemed to fly around the track, the record was announced the cr wild. Barney was the hero' of the

The second day's races were with the greatest dispatch, one is hardly finished before another will Referee-starter Fred Wagner as Abbott, clerk of the course, wer mented on the way they kept this ing.

A 10 mile handicap was the filt was for a \$50 prize. There wentries, Basle, in a Renault, with onds handicap; Aitken, in a Nation 25 seconds handicap; Harroun, in mon, and Kirscher, in a Durac scratch. The event was close, being ly contested throughout. Kirscher, Darracq, finished first in 10:55; Aith second, Harroun third, and Basle in

The second event was a trial again world's record of 48:40 2-5 for 50 m Barney Oldfield in his Benz. He was after every record up to 50 miles. He as a tire on his eighteenth mile, howen gave up the trial. He made the firm of the eighteenth in 55 seconds, the miles in 4:40, 10 miles in 9:21, and 35 in 14:04. Up to the time he burst he seemed to stand a good chance of up a new record for 50 miles.

trouble developed and he had to withdraw. Harroun drove a magnificent race, going the whole 100 miles without a stop. He experienced neither tire nor engine trouble. It was one of the most consistent exhibitions of driving of the meet. Charles Basle, in his Renault, finished second to Harroun in the Class 2 division of this race, which called for cars of piston displacement of 301 to 450 cubic inches.

Tilford Cowell, of Montgomery, Ala., entered his Chalmers-Detroit in Class 4, piston displacement of 161 to 230, being the only entry in that class. As he was on his ninety-second mile when the Renault finished third, and it was getting dark, the race was called off, but he was given first place in his class.

Ray Harroun proved the most consistent winner of the two days' racing. He won three races and finished second twice out of seven starts.

Chicago M. C. Tickets. The Chicago Motor Club will hold its election on December 18, and two tickets have been placed in the field as follows:

Ticket No. 1 .- For president, David Beecroft; first vice-president, Thomas J. Hay; second vice-president, A. J. Banta; secretary, Frank H. Trego; treasurer, H. T. Clinton. Directors-Charles P. Root, C. G. Sinsabaugh, G. B. Stiger, F. M. Sparks and O. G. Temme. Auditing committee-S. B. Comstock, C. S. Winslow and N. H. Van Sicklen, Jr.

Ticket No. 2.-For president, N. H. Van Sicklen, Sr.; first vice-president, Frank H. Martin; second vice-president, Louis Geyler; secretary, C. A. Tilt; treasurer, F. A. Case. Directors-Charles E. Grerory, E. A. Hearne, Joseph Deibler, J. P. Frisby and E. Q. Cordner. Auditing committee-G. S. Chapin, Harry W. Cooper and F. J. Robinson.

#### Ohio Good Roads Federation Headquarters in Columbus.

The good roads movement in the Buckeye State will soon be centred in Columbus when the Ohio General Assembly begins its sessions, early in the new year. The headquarters of the Ohio Good Roads Federation, of which M. M. Maxwell is secretary, will be removed from Cleveland to Columbus, and many of the officers will urge the Legislature to enact several highway measures which are needed to carry forward the improvement of the State's highways. The federation was organized in Columbus about a year ago chiefly through the efforts of George W. Lattimer and A. H. Huston, the latter being made president at the recent annual meeting. After a year's trial it is found that the work can be handled better from Columbus than from Cleveland. Much is expected of the Legislature this winter.

#### Connecticut Charter for A. A. A.

Charles Thaddeus Terry, chairman of the legislative board, has taken steps to dissolve the A. A. A. as a corporation, under the laws of New Jersey, and application will be made for a charter under the laws of Connecticut, as a membership organiza-

Commenting on the proposed change, Mr. Terry said:

"The plan for a membership organization under the laws of Connecticut will meet and overcome every criticism made during the last four or five years regarding the failure of the organization to give proper representation to the various automobile organizations throughout the country. Under the new plan every affiliated organization will have full representation on the board of directors, and its interests will thereby be fully protected. The old plan of stock holding will be entirely eliminated. There will be no stock whatever under the new conditions, and therefore no proprietary interests. A membership organization, such as is proposed, will afford the best possible working machinery for such a body as the American Automobile Association. The plan will not be so different from the one under which the national body has been working as to disturb the routine of the organization."

### To Manufacture Commercial Vehicles.

The United Vehicle Company is being organized in Boston by A. L. Waugh, Frederick Wells and J. G. McDonald, to manufacture a line of commercial vehicles ranging in carrying capacity from ½ ton to 5 tons. Mr. Waugh has been a commercial vehicle dealer for a number of years and has considerable experience in the mechanical end of the business. It is planned to acquire a building site adjoining the present Waugh plant and erect a concrete factory of 80,000 feet of floor space thereon. An output of 150 cars is planned for the first year.

New Factory for the Springfield Car. The Springfield Motor Car Company, of Springfield, Ill., are erecting a saw-tooth roof building of brick and concrete, 500 by 260 feet, to be devoted to the construction of the Springfield car. Their 1910 car is a four cylinder, 5 by 434 inches, seven passenger ear, having a 128 inch wheel base, 36 by 4 inch front and 36 by 5 inch rear wheels. The car is to be marketed, fully equipped with Bosch magneto top, lamps, etc., for \$2,500. The officers of the company are: H. C. Medcraft, president; R. W. Haas, vice-president; E. E. Stoltz, secretary; A. H. Rankin, treasurer.

#### Additions to Oscar Lear Plant.

Receiver Charles Bauer of the Oscar Lear Automobile Company, Springfield, Ohio, on November 9 obtained permission from the courts to erect an addition to the plant, of the company, not to exceed \$25,000 in cost, and immediately gave a contract for the erection of two reinforced concrete buildings, of which one is to be 100x60 and two stories high, and the other 195x60 feet and one story high. Work on the new buildings has already begun.

#### Commercial Notes.

The Minneapolis (Minn.) Police Department is to be provided with an automobile at a cost not to exceed \$2,000.

The new central police station in St. Paul, Minn., will be equipped with a high power touring car and an electric patrol wagon.

The Detroit Board of Health has purchased a four passenger electric brougham for the use of Dr. Guy L. Kiefer, the health officer.

The City Council of Birmingham, Ala., has placed an order for a 45 horse power Rambler combination pumping engine and hose truck, which will be delivered in the near future.

It is reported that a company is being formed among business men of Stamford, Conn., and the outlying country districts for the purchase of a large motor truck and

a motor omnibus to be operated between Stamford and Bedford Station, Mt. Kisco, Katonah and several of the towns and villages along the Harlem Railroad.

The Twin City Taxicab Company, which was recently incorporated in Minneapolis, Minn., with \$600,000 capital stock, plans to have a taxicab service with about sixty cabs in operation by February I next.

#### **Business Opportunities.**

Albert Hiorth, an electrical engineer located at Josefinegade 19, Christiania, Norway, who has maintained relations with the American automobile industry for many years, and C. L. Segelke, a student of agriculture, have applied for a Norwegian patent on a reaper drawn by horses and having the sickle operated by means of a motor. A machine to try out the invention will be built before next summer, and the trials will be made at the Christiania Agricultural College. Mr. Hiorth would like to hear from manufacturers of suitable small motors.

A report has been received from an American consular officer in a European country forwarding a request from a local business man for quotations on automobiles and freight cars with a carrying capacity of five tons without platform. The party in question is willing to pay one-third with order and the balance upon the arrival of the cars, these terms having been quoted by European manufacturers. He has opened a school for the instruction of drivers, and, should American cars be satisfactory a most profitable field will be opened for these goods. Further detailed information in the report can be obtained by interested firms upon application to the Bureau of Manufactures.

An American consular officer in Canada reports that there are no manufacturers of automobiles or parts in his district, and for that reason there is an excellent opening for manufacturers of American automobiles. Until recently there were many restrictions as to the use of the public highways by motor cars, but these restrictions have all been removed. The consular officer states there are a number of manufacturing agents who might be interested in the acceptance of a reliable agency, but on account of the accessibility of the field it would be well for interested firms to send a representative to the city in which he is located for the purpose of establishing an agency for the coming year. The address can be obtained from the Bureau of Manufactures, Washington, D. C., by referring to No. 4,168.

#### Obituary.

Our Milwaukee correspondent telegraphs that George L. Odenbrett, junior member of the Bates-Odenbrett Automobile Company, Buick and Winton agents in Milwaukee, was killed on November 29, by an explosion which wrecked the plant of the Gas Tank Recharge Company, of which he was part owner. Mr. Odenbrett was the first automobile owner in Wisconsin.

### GARAGE AND SALESROOM.

#### The Stoddard-Dayton Garage, Los Angeles.

One of the largest of the fifteen new garages completed in Los Angeles during the last three months was occupied October I by the Stoddard-Dayton Motor Company, general selling agents for the Stoddard-Dayton and the Baker electric cars west of Colorado. The building, a two story structure in Mission style, is located on the corner of Olive and Tenth streets, within four blocks of the business centre, and in the heart of the coming automobile district of Los Angeles. Olive street is the only thoroughfare within a short distance of the Los Angeles business district that is not encumbered by car tracks, leaving the highway clear for motor traffic, and a movement is on foot to have the street declared a boulevard in order to prevent the granting of a franchise for a street car line.

The lower floor of the building, with dimensions of 100x140 feet, is occupied by the salesroom, the offices and the garage. Fireproof walls extending through the second floor and 4 feet above the roof, together with double fire doors, separate the garage from the rest of the building. The salesroom, 100x40 feet, fronts on Olive street, and is lighted by large plate glass windows from the front and side. The tiled floor, the neutral tints of the walls and the massive beams of the ceiling create an atmosphere of solidity and refinement. It offers ample space for the display of sixteen models. A fireproof driveway leads from the showroom to the garage in the rear of the building, and this driveway divides the offices running almost through the centre of the building between the showroom and the garage. The offices occupy a space 100x17 feet, less the room taken up by the driveway. Separate office rooms have been provided for the president, the treasurer and secretary, the bookkeeping department and the general office, and two rooms are set apart for the salesmen. The toilet rooms for customers are located at

can find accommodation on the floor. Two pits, with cement steps leading down into them, have been provided for the accommodation of customers desiring to make an inspection of their cars. An electric elevator 10 feet wide, with a capacity of 3 tons, transports cars to the shop on the second floor. Two gasoline tanks containing

NEW STODDARD-DAYTON GARAGE, LOS ANGELES.

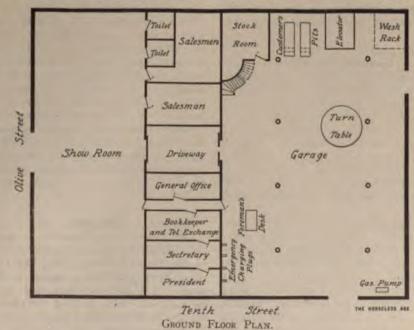

the end of the transverse row of offices, with doors leading to the showroom.

The entire rear portion of the building, 100x170 feet, is given over to the garage, which has two separate entrances, one leading into the room directly from Tenth street, while the other one extends along the rear wall of the building, and also emerges on Tenth street. The floor is of concrete on which rest two rows of steel pillars supporting the beams that carry the upper portion of the structure. Forty cars

120 gallons each are located under the Tenth street sidewalk. A Bowser long distance pump lifts the fluid into a portable tank wheeled alongside of the cars. A similar system is used for the distillate used for cleaning purposes, of which 140 gallons are stored under the rear driveway. A turntable for the turning of trucks is located in front of the elevator. A store room occupies one corner of the garage, and is filled with light sundries and the oil supply. The garage is also equipped with four emergency charging plugs for electric vehicles.

The garage takes care only of the business of the firm's customers. It is open night and day, and can be entirely closed up and isolated from the rest of the building. The same is true of the electric charging plant on the second floor, provided with seventeen rheostats for supplying current to the batteries. The elevator opens directly into the charging room where the largest amount of business is transacted during the night.

The shop on the second floor is directly above the garage, and has the same dimensions, 70x100. Its floor is of cement, with a wash rack, draining into a sink below the driveway in one corner. Both the wash racks in the garage and in the shop are equipped with reflectors raised and lowered by pulleys. The toolroom occupies the space corresponding to the stockroom in the garage. Light is admitted to the shop from two sides and through skylights. Two continuous benches, 140 feet long, ran

along the walls, and each workman has his individual drawer for his tools and a locker for his personal belongings. Four engine jacks, two drill presses, a 16 inch lathe, an emery wheel, a full set of tools and dies constitute the equipment of the shop. A gas blower is used instead of a forge. An air line with cocks all along the benches has been installed.

Special efforts have been made to provide fire protection. An 80 gallon chemical truck is stationed in the garage, besides thirty portable fire extinguishers, four dozen "kill fires" and a hose line. It was discovered that barrels of sand offered even better protection than the chemicals, and a plentiful supply of this cheap extinguisher was placed in all parts of the building.

One of the most important portions of the establishment is the stockroom, or rather series of stockrooms, on the second floor. Since the firm supplies the trade of the entire Pacific Coast, a complete line of Stoddard-Dayton parts is carried. The smaller parts are stored in cases arranged according to the different models. Cylinders. crank and transmission cases, rear and front axles, tires, rims, frames and mud guards, car springs and wheels from the earliest to the latest 1910 model are kept on hand, thus making it necessary to devote a space of 100x17 feet, corresponding to the offices on the first floor, to the storeroom. Besides these parts the firm carries in stock every fibre, rubber, felt and copper washer and gasket, every spring used in the different models. A still larger storeroom. 40x100, corresponding in size and location with the showroom on the first floor, contains the new cars of the firm, together with rear seats, tops and one body of each model. This room has not yet been finished up, as it is to be used as an additional showroom when business warrants.

The firm has an elaborate system of bookkeeping and checking, using consecutively numbered blanks in triplicate for every transaction, whether it be the issue of a spring from the storeroom or the order of a carload of new models from the factory. The blank forms of the system fill a cabinet 9 feet wide, 7 feet high and a foot deep. Special attention is paid to the accurate recording of the cost of work performed, both in labor and material. Except for cash sales every customer is required to sign his name to an order for the work to be done or the supplies to be furnished. These repair orders are in triplicate, all copies bearing the same serial number. The original is filed with the signature of the customer. The first copy, containing on its back ruled columns for the date, the description of each piece of work done on the car, for the name of the workman performing it, for his time, for the total cost and the charge, goes to the bookkeeper. The third copy, on heavy brown paper, goes to the foreman of the garage. Besides the order and the columns for its itemized cost it contains special columns for the cost and the charge for material, and for outside labor and material.

Every workman is daily furnished with a time card, each card being placed in a holder and suspended on a board in the shop. On this card the workman must account for every minute of his working time. Every separate piece of work performed by him must be entered on his card, giving the number of the repair order, the customer's name, a description of the work. and the number of hours and minutes required on the job. The card must be dated and signed by the workman at the end of every day, thus enabling the foreman to determine the labor cost of a particular job at a glance, besides preventing waste of time.

#### Kansas City Dealers Part Company.

Fifteen members of the Kansas City Motor Dealers' Association withdrew from that association on November 20, and organized the Motor Car Trade Association. They have engaged Convention Hall for the week of January 17, for the purpose of giving a show, and have issued an invitation to all of the members of the old organization to participate in it. The Kansas City Motor Dealers' Association, however, held a meeting at the Hotel Kupper. on November 20, and decided to hold its show in Convention Hall, as originally planned, during the week of February 28. They held another meeting on November 27, for the election of new officers (some of the old officers having seceded) and the appointment of a show committee. W. S. Hathaway is chairman of the show committee of the new Motor Car Trade Association.

### Brooklyn Dealers Complete Organization.

The Brooklyn Automobile Trade Association was definitely organized at a meeting held at the establishment of the Allen-Swan Company on November 24, and the following officers were elected: W. H. Kouwenhoven, of the I. M. Remsen Company, president; Lew H. Allen, of the Allen-Swan Company, first vice president; Joseph D. Rourk, of the Haynes Company, second vice president; C. M. Bishop, of the Ford Company, secretary, and F. C. Kirkham, of the Maxwell Company, treasurer. The association will hold its annual meeting on December 14.

#### Portland Auto Dealers Elect.

The Portland Automobile Dealers' Association held its annual meeting at the Commercial Club on Monday of last week. Officers for the ensuing term were elected as follows: President, C. F. Wright, of Ballou & Wright; vice president, P. A. Coombs, of the Archer-Coombs Company; secretaries, R. E. Blodfett, of the Firestone Tire Company, G. S. Brackett, of the White Motor Car Company. The membership of the organization has been materially

strengthened during the past six months because of the advent of nearly a dozen new dealers in the Portland field, and as a result a feeling of keen rivalry has prevailed between the old and new dealers. It is hoped that the organization will bring the dealers in closer touch with one another and this commercial enmity will vanish.

#### Garage Notes.

Los Angeles, Cal.—W. R. Woolwine has taken possession of the new garage on Olive street, near Eleventh. Mr. Woolwine has the agency for the Oldsmobile and Cartercar.

Los Angeles, Cal.—W. J. Burt, superintendent of the Tourist Motor Car Company, of this city, is organizing the W. J. Burt Motor Car Company, and will take up its active management on January 1 next. The company will be incorporated with a capital stock of \$50,000, and will handle the Auburn car and carry a stock of Tourist parts.

RIVERSIDE, CAL.—Charles Young is having an 85x157 foot garage erected on Main street. The front of the building is of gray stone. The offices and salesroom in the forward part of the building are to be finished in mahogany, and to have tile flooring.

SAN FRANCISCO, CAL.—The Pioneer Automobile Company, of which E. P. Brinegar is president, will shortly move from its present location in Golden Gate avenue and Octavia street, to a store on Golden Gate avenue, between Gough and Franklin streets. A stock room and repair shop will be secured in the vicinity.

DENVER, Col.—Charles E. Johnson will begin work on a garage on the same block as the Corona school, the school board having withdrawn their protest against its erection.

NIANTIC, CONN.—George B. Dickinson is building an extension to his garage on Main street.

BRIDGEPORT, CONN.—I. D. Carpenter has let the contract for the erection of a 60x74 foot brick garage on Harrison Court. The building will have concrete floors and a gravel roof.

STREATOR, ILL.—Charlie Hutchinson is erecting a 55x150 foot concrete block garage at 125 South Park street. George Benckendorf and M. Kakara, agents for the Moline car, will have charge of the new concern.

CROWN POINT, IND.—P. Williams is about to remodel part of his livery stable into a garage and repair shop. It is his intention to run an auto livery in conjunction with his horse livery.

Indianapolis, Ind.—The Buick Motor Company have established a new repair department at 459 South Alabama street.

FRANKFORT, IND.—Laird, Alford & Forsythe, who have been engaged in business under the firm name of Frankfort Auto Company and the Motor Car Sales Company, have sold their business and garage

on East Washington street to Wm. Kernodle and B. F. Jones, both of Jamestown, who will do a general auto and repair business. They will handle the E-M-F.

FORT MADISON, IA.—The Automobile Supply and Engine Company have opened for business at 213 Cedar street. E. Corsepius is manager and George Cuthbert superintendent. The company will conduct a garage business in addition to manufacturing marine engines. Several lines of autos will also be handled.

GRUNDY, IA.—The Grundy Auto Company and the Burd Auto Company have consolidated. The main place of business will be Grundy Center, and a branch will be maintained at Waterloo. The company will handle the Mitchell and Oakland.

MAQUOKETA, IA.—J. G. Roberts, of Lost Nation, has taken a five years' lease of the garage to be erected by A. A. Hurst, next to the Hurst Hotel.

MARSHALLTOWN, IA.—Mohr & Crawford, who conducted a garage and machine shop at 119-123 East State street, have dissolved partnership. Mr. Crawford has sold his interest to W. A. Norton. Hereafter the firm will be known by the firm name of Mohr & Norton.

OSAGE. IA.—W. J. Towner has bought the garage of Oscar Grow.

Pella, Ia.—Work has commenced on the Fowler Auto Company garage. The structure will be entirely of steel, and will be fireproof.

Bridgeton, Mr.—Henry J. Halkett has built an addition to his workshop on Flint street, to be used as a garage.

WINNIPEG, MAN.—T. Eaton Company are erecting a garage on Graham and Carlton streets to cost \$6,500.

BALTIMORE, MD.—The police department are to have a 22x24 foot one story brick garage erected in the rear of the Central Police Station, to house the Central District automobile patrol.

BALTIMORE, MD.—The White Automobile Company have let the contract for the erection of a 76x134x156 two story fireproof building on the southeast corner of Mt. Royal avenue and Hunter alley, to cost \$16,500.

BOSTON, MASS.—The Corlew-Coughlin Motor Company have recently remodeled a building on Hawkins street, to be used as a garage and repair shop.

Boston, Mass.—George H. Lowe, the well known automobile dealer, of this city, has organized the Henderson-Lowe Company to handle the Midland car in the New England States. Salesrooms in charge of Mr. Lowe will be opened at 117 Massachusetts avenue.

TURNERS FALLS, MASS.—A. H. Rist is building a garage in the rear of his residence on South street.

WATERTOWN, MASS.—Henry E. Fleming has obtained a permit to build a garage on his property at 24 Elliot street.

DETROIT, MICH.—The new Oldsmobile garage on Woodward avenue and Sproat

street will be formally opened this week. The salesroom is finished in Mission oak. Herbert Flint is manager.

Detroit, Mich.—The Firestone Tire and Rubber Company sustained a loss of \$20,000 by a fire which completely destroyed the historic old Biddle House, the lower part of which was occupied by several concerns dealing in automobiles and accessories. The Jackson Auto Company also sustained a loss of \$2,500; the Detroit Tire and Repair Company, \$1,000, and the Studebaker Company, \$1,000. A number of machines were rescued before the fire department arrived.

GRAND RAPIDS, MICH.—The Ford Motor Company, of Detroit, have opened offices and a garage at 161 and 163 North Owatta street, in charge of R. E. Becker.

Bemidji, Minn.—John Moberg has opened a garage.

MINNEAPOLIS, MINN.—The Motor Sales Company are erecting an addition to their garage on Sixth street, which they expect to be ready for occupancy by December 15. The new structure is being joined to the present building, and when finished the company will have 5,000 feet of floor space.

Morris, Minn.—Lawrence Zahl will establish an auto livery.

WHEATON, MINN.—L. A. Wilson, of Berlin, Wis., is to open a garage and repair shop in a week or two.

Kansas City, Mo.—The Midland Motor Car Company have moved to their new headquarters at 1523-25 Grand avenue.

KANSAS CITY, Mo.—The L. C. M. Motor Car Company, recently organized, have opened quarters at 3816 Main street. They will handle the Palmer-Singer and Simplex cars.

KANSAS CITY, Mo.—The name of the Ettwein Motor Car Company has been changed to the McGee-Huckell Motor Car Company. The agency handles the Mora, Fiat, Wilcox, Courier, Crawford, Stoddard-Dayton and Fritsche electric.

Kansas Crry, Mo.—Meils Motor Company will hereafter occupy the present quarters of the Auburn Motor Car Company at 624 East Fifteenth street. They will handle the Lambert car. The Auburn Motor Car Company removed to Grand avenue

SPRINGFIELD, Mo.—A garage is being erected for Frank Hood and James Ellis on South Jefferson street, adjoining the Queen City Laundry. The building will be of concrete blocks and will cost \$7,000. It will be ready for occupancy in about two months.

ANACONDA, MONT.—C. H. Branscombe will have charge of the garage now in course of erection on West Park street, when completed.

AINSWORTH, NEB.—Geo. Sawyer and W. E. Smith have bought the new garage building from R. S. Rising.

LEIGH, NEB.—The Leigh Motor Company are constructing a two story brick garage on Main street.

JAMESTOWN, N. DAE.—Ray Lamberton has sold his interest in the Sixth Avenue Garage to Buckley & Rand.

NEWARK, N. J.—P. Broderson is having a garage erected on Central avenue near Shepard.

NEWARK, N. J.—Joseph S. Isidor is having plans drawn for the erection of a garage at 402 Prospect avenue.

NEWARK, N. J.—H. J. Koehler has purchased the property formerly occupied by the Motor Car Company of New Jersey, at 289-293 Halsey street.

BUFFALO, N. Y.—M. J. Healy is building a cement block garage on the Root property on Main street.

NEW YORK CITY, N. Y.—The three story stable at 271-273 West Eighty-seventh street is being converted into a garage for Hugh F. Weston, as lessee.

ROCHESTER, N. Y.—A. M. Zimbrich will move to larger quarters on Plymouth avenue South, property recently purchased from the United States Automobile Company.

Toledo, Ohio.—The Norris-Toledo Motor Sales Company have opened salesrooms and offices at 623 and 625 Madison avenue. They have the agency for De Mot, Parry and Velie cars.

PHILADELPHIA, PA.—Alfred C. Gobson has let a contract for the erection of a garage at 707 Westview avenue. Estimated cost, \$4,700.

PHILADELPHIA, PA.—Edward C. Benson, formerly secretary and treasurer of the Philadelphia Automobile Company, has joined the sales staff of the Packard Automobile Company, of Philadelphia.

PHILADELPHIA, PA.—The Franklin Motor Car Company have moved into a new garage at 3430 Chestnut street, where they occupy two floors measuring 40x120 feet. A repair shop will be conducted in connection with the salesroom.

PHILADELPHIA, PA.—The Longstreth Motor Car Company, agents for the Pullman car, have opened a branch store at 912 Chestnut street. The company are occupying temporary quarters at 1407 Race street, until the completion of their new building at 257 North Broad street.

PHILADELPHIA, PA.—The Oxford Automobile Company's garage was completely destroyed by fire last week, together with thirty-three automobiles belonging to individual owners that were in the building. The fire was caused by a lighted match dropped by a man who was looking for a leak in a gasoline tank. The loss, which will fall largely upon the owners of the machines, is said to be over \$75,000.

READING, PA.—The Boyer livery stable at the corner of Cherry and Pearl streets is to be transformed into a garage.

READING, PA.—The Bertolet Motor Car Company have been organized, and secured quarters at 15 South Fifth street, to handle the Mitchell and Hupmobile in Berta, Schuylkill and Lebanon counties. Dr. J. M. Bertolet is president of the company.

### NOTES OF THE INDUSTRY AND THE SPORT.

R. A. Duff plans to manufacture carburetors in Nebraska City, Neb.

In Birmingham, Ala., there are about 550 cars, according to the registration figures.

The Seeley ignition system has been adopted by the Columbia Motor Car Company, Hartford, Conn., for 1910.

The Studebaker Automobile Company announce that they may add \$100 to the price of their Studebaker E-M-F "30" about February I.

Lectures on aerial navigation and automobile engineering are to be given at the Vienna Technical High School in the course of the present winter.

A company is being organized at Bay City, Mich., with a capital stock of \$100,000, to manufacture and place on the market a motor truck built by Toeppner Brothers of that city.

It is reported that the De Schaum-Hornell Automobile Company has secured an option on 32 acres of land near Wyandotte, Mich., with the object of erecting an automobile and parts factory

The Nebraska Puncture Proof Company has been organized in Omaha to manufacture a jelly-like compound which is claimed to render pneumatic tires puncture proof when injected into the inner tubes.

The Solax Auto Truck Company, which was organized in Kansas City about a year ago with a capital stock of \$50,000, is negotiating with the Greater Leavenworth (Kan.) Club regarding removal to Leavenworth.

Two persons were instantly killed and another seriously injured when 7 feet of a new concrete smokestack in course of erection at the factory of the Rapid Motor Vehicle Company crashed 158 feet to the ground on November 19.

The Detroit-Dearborn Company (not Dearborn-Detroit, as mentioned in a recent issue) have been organized since August 16, and inform us that they have their factory established. They will produce a four cylinder, 30 horse power car.

H. D. Wilson, the head of the Packard Motor Car Company's Paris office, says that from January 1 to September 30 he was in touch with more than 200 Packard touring parties in Europe, and expected to have a total of 250 at the end of the year.

The Federal Rubber Company, of Cudahy, Wis., have increased their capital to \$620,000 paid in, and it is contemplated to increase this amount to \$750,000 January 1. The Federal Rubber Company have completed a new tire building, which will have a capacity of 250 tires a day and 500 inner tubes. The company have just opened a branch in Atlanta, Ga., with the Dunham Rubber Company. They also have an exclusive agency in St. Louis with the Phoenix Auto Supply Company, and in Kansas City.

Mo., with the Motor Tire and Supply Company.

The Vanguard Manufacturing Company, of Joliet, Ill., have opened a selling branch at 1427 Michigan avenue, Chicago, under the management of C. H. Johnson.

At Ascot Park, Los Angeles, November 20, a Corbin car, equipped with the Seeley ignition system, won first in a 5 mile handicap and second in the "10 mile free-for-all."

In Missouri 5,500 licenses have been issued to private owners since the new law went into effect on August 16, as well as 1,800 to drivers and 300 to manufacturers and dealers.

The Elkhart Carriage and Harness Company, of Elkhart, Ind., have completed the first car of their new low wheeled, pneumatic tire type, and sent it on a test run to Milwaukee.

The Continental Caoutchouc Company, of 1788-90 Broadway, New York city, have placed an agency in Los Angeles, Cal., with the E. A. Featherstone Company, 1018 South Main street.

The Rainier Motor Car Company have on exhibition at their salesroom at Sixtyfourth street and Broadway, New York, the beautiful Atlanta trophy won by L. A. Disbrow at Atlanta, Ga.

The Beyster-Detroit Motor Company has been organized at Detroit with a capital stock of \$50,000 to manufacture light livery cars and runabouts in the plant of Beyster, Thorpe & Co., 1329 Woodward avenue.

The Royal Tourist Car Company, of Cleveland, announce that they will turn out 400 cars during the present season, in series of fifty. Their line includes a runabout, two touring cars, a limousine and a touring car with special dustless body.

The Maxwell-Briscoe Motor Company have issued a photograph showing their various plants, which represent 119 acres. By the first of the year, when the additional 175,000 feet of factory space now in the course of erection is completed, the company will have on its payroll nearly 6,700 employees.

The Times Square Automobile Company, of New York, have established a distributing depot in Philadelphia at 238-240 North Broad street. The showrooms and repair shop will cover about 9,000 square feet of floor space. This is the fifth branch store of the firm, which also has stores in New York, Chicago, St. Louis and Kansas City.

Machinists employed by the Empire Motor Car Company at Indianapolis are on strike, and it is understood the company is not negotiating for them to return to work. Recently the company posted a notice that after December I the men would be expected to work ten hours each day, except Saturday, when they would work five hours, with time and one-half for overtime. The

men are demanding nine hours daily except Saturday, when they want to work five hours, with overtime at one and one-half times the regular scale.

The Raber-Lang Company, of South Bend, Ind., have completed their first two automobiles, both two cylinder machines, one rated 16-18 horse power and the other at 18-20 horse power. They will probably be marketed at \$500 and \$650 each. Charles McLaughlin is superintendent of the firm.

The Ford Motor Company have established a branch in London, England, at 55-59 Shaftesbury avenue, in charge of P. L. D. Perry. Mr. Perry was for some years the senior member of the automobile firm of Perry, Thornton & Schrieber, who handle the Ford throughout the United Kingdom.

The Edgewater-Fort Lee hill climb scheduled for Thanksgiving Day had to be postponed on account of a sleet storm until December 4 at I P. M. The course was coated with ice and snow, and, in addition to the fact that no spectators would have been attracted under these conditions, there would have been great danger to the contestants.

S. M. Comley and E. D. Davidson, president and secretary, respectively, of the National Fuel Company, of Columbus, Ohio, have assembled a two cylinder runabout, which will probably be manufactured in quantities next season. It is proposed to incorporate as the Buckeye National Motor Car Company and to locate the factory in Columbus.

The Simplex Automobile Company, of New York city, have bought the plant of the Empire Foundry Company in New Brunswick, N. J., where they will make castings for their cylinders, etc., and later also do other work. The company will move out to New Brunswick by degrees, but their headquarters will remain in New York for the present.

Eight dealers of Fort Worth, Tex., held a meeting at the Board of Trade rooms on November 23 for the purpose of organizing an association and arrange for a show in connection with the fat stock show to be held in Fort Worth in March. M. A. Sacksteder, of the Dallas Automobile Association, made an address, dwelling upon the advantages of organization.

At the annual meeting of the stockholders of the Barndt-Johnston Auto Supply Company, of Columbus, Ohio, the present officers were re-elected for the coming year as follows: C. Christian Born, president; Walter R. Johnston, vice president, and Charles F. Barndt, secretary-treasurer. The announcement was made that because of largely increasing orders more than \$100,000 would be expended in making extensions to the plant on Donaldson street. The concern

was started several years ago to make buggy and auto bodies, but recently the product has been broadened considerably.

The first "Badger" to be produced by the Badger Motor Car Company, of Columbus, Wis., was shipped to the general distributors, Webb Jay & Co., Michigan avenue, Chicago, on November 24.

The Empire Tire Company, of Trenton, N. J., have opened a Philadelphia branch at 322 North Broad street, in charge of E. B. Richardson, who has been connected with the company for years.

#### Club Notes.

The Sternberg Manufacturing Company, Milwaukee, Wis.—Capital stock, \$50,000. Incorporators, William Sternberg, Ernst M. Sternberg and Robert M. Hayssen.

A motorcycle club was formed at Macon, Ga., on November 19, with W. E. Pendleton as president. The organizing meeting was held in the office of the Macon Chamber of Commerce.

The board of trustees of the New Jersey Automobile and Motor Club have expelled G. W. Edmondson from the club as the result of a conviction of reckless driving. The charge was admitted by Edmondson.

The A. C. of America will hold its annual banquet in the ball room of the Waldorf-Astoria Hotel, New York, on January 31. Frederick D. Underwood has been appointed chairman of the banquet committee.

The Ohio Valley Automobile Club directors held a meeting at the Board of Trade Assembly Hall, Wheeling, W. Va., on November 23, to discuss the new ordinance that was introduced in the City Council on the same night.

Secretary Bert Van Tuyle, of the New York State A. A., and of the Rochester A. C., is at present making a trip around the State, visiting all of the automobile clubs, both those affiliated with the State Association and those not.

The Upper Westchester Automobile Club held a meeting at the office of Clinton S. Arnold, in Ossining, N. Y., on Nevember 18 and considered the question of joining the A. A. A. It was decided to lay the matter over until the next meeting.

The annual great winter competition of the Royal A. C. of Sweden will be held this winter, February 20-23, between Stockholm and Gothenburg, a distance of about 300 miles. Two prizes will be offered, known respectively as the "Winter Cup" and the "Gothenburg Cup."

A Buffalo motorcycle club has just been formed at Buffalo, N. Y., with a membership of 105. It is proposed to hold a triunion meet between the motorcycle clubs of Buffalo, Rochester and Syracuse, one meet to be held May 30, one on July 4 and one on Labor Day. The Buffalo Club proposes to rent a house on Main street, with facilities for storing a large number of machines. Runs will be held every Sunday. The acting officers at present are: E. C. Cramp, president, 912 Main street; Thomas

French, Jr., secretary-treasurer, 895 Main street.

The Texas Automobile Association was organized at San Antonio on November 16 and will affiliate with the American Automobile Association. The following board of directors was elected: R. W. Carr and C. C. Cresson for San Antonio, E. H. R. Green and E. Corey for Dallas, Percy Williams for Waco, and Dr. A. H. Evans and Joe Debona for Eagle Pass.

The Tampa (Fla.) Automobile Club, at a meeting held at the Board of Trade on November 18, discussed a project for the construction of an automobile track in that vicinity. Options have been secured on two tracts of land, but one of them will expire shortly. About \$23,000 would be required for the purchase of the land, and of this \$9,000 has been subscribed.

The Royal A. C. of Great Britain will publish a work entitled "A Record of Motor Racing," of which Gerald Rose is the author, and which contains a preface by Prince Francis of Teck. In addition to the history of automobile races it contains a number of special chapters on such subjects as "The Timing of Motor Races," "The Mechanical Details of the More Important Cars," etc.

The Cleveland (Ohio) A. C. at a meeting last week elected the following officers: W. F. Bonnell, president; Harry L. Vail, vice president; C. J. Forbes, Jr., secretary; F. T. Sholes, treasurer. Resolutions of sorrow were adopted on account of the death of E. Shriver Reese, a former president of the club. Negotiations were practically completed whereby the Aero Club of Cleveland will make use of the clubrooms of the automobile club.

The trustees of the New Jersey Automobile and Motor Club have decided upon the property of Dr. Leslie D. Ward, in South Broad street, as the most desirable site for their proposed new clubhouse. It is planned to issue \$100,000 5 per cent. bonds, to be secured by a first mortgage on the property, to raise the necessary money for the purchase of the site and the erection of the building. The property has a frontage of 50 feet on Broad street, and a depth of 200 feet

The Jacksonville (Fla.) A. C. held its annual meeting on November 19. A committee was appointed to call upon the mayor to urge the enforcement of the ordinance prohibiting the throwing of glass on the streets. Charles A. Clark was re-elected president, W. M. Stinson was elected first vice president, J. E. Johnson second vice president, and Frank C. Boylston re-elected secretary and treasurer. The subject of constructing a speedway came up for discussion. A three mile track, leading partly over already built roads, was generally favored, and a committee was appointed to report on the proposition at a special meeting. Complaints were made about the restrictions enforced in South Jacksonville, where the speed is limited to 6 miles per hour, and a committee was appointed to call on the mayor of that city and to urge a modification of the ordinance. Steps were taken to take out a charter for the club.

#### Racing Notes.

The statement in our last issue that Barney Oldfield broke the mile record for one mile tracks at San Antonio, Tex., on November 15, was incorrect. This record is held by Ralph De Palma, in a Fiat Cyclone, and was made at Minneapolis.

A concrete wall three feet high and one foot thick has been built around the course at the Indianapolis Motor Speedway and it is believed this will be sufficient to keep racing cars from leaving the track. The paving on the course is about completed and the grand stands are also about finished. When the speedway is reopened next month the seating capacity will be double what it was at the August meet.

#### Trade Personals.

W. T. Powell has been appointed Western sales manager of the Hartford Rubber Works Company, to succeed William H. Bell.

Fred E. Castle, of the Atwood-Castle Company, of Amesbury, Mass., is stopping at the Hotel Astor, New York city, showing the company's 1910 product.

Edward Fritton, who has been superintendent at the factory of the Covert Motor Vehicle Company, in Lockport, N. Y., has been elected secretary of the company.

William H. Bell has resigned from the position of Western sales manager of the Hartford Rubber Works Company, to become manager of the Chicago branch of T. B. Jeffery & Co.

Edward C. Huhn has been appointed manager of the Keystone Lubricating Company automobile oil branch at 1327 Race street, Philadelphia. Mr. Huhn was formerly connected with the Puritan Soap Company's branch in Philadelphia

F. E. Weir, who has been connected with the sales forces of several of the leading manufacturers during the past ten years, has been appointed manager of the new Ford Pittsburg branch, temporarily located at 130 North Highland avenue.

W. Hildreth has resigned from the position of vice president and manager of the Holsman Automobile Company, of Chicago, with whom he has been for the past seven years. Mr. Hildreth informs us that his resignation is entirely voluntary, and that the company has his best wishes. He expects to spend some months in travel and recreation before taking up active business again, but his home will remain in Chicago.

The Cincinnati Hospital has recently been equipped with a motor ambulance which carries cots for four patients. The cots are in use ordinarily, one swinging over the other, but if necessary a bank can be drawn down on the other side as an upper berth in a sleeping car, and seats that fit together can be used.

**NUMBER 23** 

### Building a Car from Standard Parts.

By E. J. Bartlett

Not so very long ago the fact that a car was made up even in part of standard units purchased complete from a parts manufacturer doubtless had a certain cheapening effect, and to say the least did not in itself add prestige to the product. There was reason for this feeling. Parts manufacturers in general were not abreast of the times, and the "made in our own factory car" had distinct practical as well as selling advantages.

There has been a change in the situation in the past few years, as the parts business has gained a firmer footing, and as the manufacturers have developed and perfected their products. As the market has developed a better grade of parts has been demanded, and perhaps naturally they now conform closely in quality to the cars in which they are used. It may fairly be said that at the present time the parts in general on the market as standard are not as highly developed as a few of the leading high grade cars; they are on a par with the average high grade and medium cars, and in advance of many of the cheaper cars which are trying to gain a foothold.

USED BY ESTABLISHED FIRMS.

During the past year or two the bulk of the parts sold has been used on cars with established reputations, and which have been produced by competent organizations. The only reason for using standard parts was the fact that a larger output of finished cars was possible, as the factory at hand could be devoted entirely to the manufacture of some of the most important or distinctive units. There was a factory, however, and an organization having both business and technical men familiar with automobile construction. Under such conditions the use of more or less standard units was successful.

As the market for finished cars has broadened and increased, more and more standard parts have been used by the established automobile builders, and doubtless many engaged in other lines of business, not realizing that any special business or technical training was necessary, have argued that if the use of some finished units in a car was successful, a car built entirely of finished units would be equally as good. At any rate, a multitude of "assembled car" companies are springing up all over the country, depending entirely on the parts manufacturers for their being. Coincident

with this sudden increase in the demand for parts from this source, hundreds of carriage builders are entering or preparing to enter the automobile field. In most cases they are better equipped financially than the newer companies; they have factories for the necessary body work, sales organizations, and a factory organization, none of which have, in general, any special training in the automobile business. These two important additions to the industry made an enormous prospective demand on the parts makers and many new parts companies are being formed, some of which are doubtless as poorly equipped as the buyers to enter the business.

#### ALLUREMENTS AND PITFALS.

On the surface the building of cars from finished parts or units appears attractive. The parts makers guarantee and presumably are responsible for their products and extend credit. Agents are found who will pay advance deposits on cars. A factory for assembling with a very small machine tool outlay, a little capital for running expenses and the business is

Whether the new company is formed by men who are conducting other lines of business or is a side venture of an established company in some other business, the men responsible for it almost invariably have had no previous experience in automobile manufacture. If a new company, a more or less practical man knowing something of the rudiments of automobile engineering and construction is engaged to select the parts and oversee the construction of the car. If it is an old company branching out into the automobile field these duties are usually assigned to the superintendent of the old company who is doubtless a practical man, but who knows little or nothing of automobile engineering. Right at the start many of the newer companies are thus making a vital mistake. They underrate the difficulties of building a commercial car from standard parts. They do not realize that fully as good and experienced an automobile engineer is required as though an entirely new car was to be designed from the ground up. They depend too much on the different parts, each, perhaps, correctly designed for different conditions, working together satisfactorily as a combination. Only the best automobile engineer procurable can make a distinct success of such a venture, and even then he needs the support of a sound business and factory organization.

LINE OF PROCEDURE

While the details incident to forming the company are being completed the engineer solicits bids from the parts makers for parts suitable for the class of car it is decided to build. After a deal of correspondence and talking with the salesmen of the various parts companies a preliminary line-up of the parts procurable is possible. This line-up shows that it will be impossible to obtain exactly the parts for the car as first planned, as some parts cost more than the amount allotted to them, while other parts desired cannot be obtained in time, as the makers have too much earlier business on hand. To get certain parts in time and at the price allowed, it may be necessary to throw the whole design out of balance, some parts being heavier and more expensive than necessary, while others are too light for the car. Parts makers refuse to make their products specially to suit the conditions at hand, and the engineer is obliged to use constructions he would prefer changed. Eventually out of the chaos a fairly satisfactory line is selected by the engineer and the business organization prepares to close the contracts.

#### MUST HAVE GOOD RATING.

Not infrequently a bump of trouble is here encountered. Parts makers have been too often caught in the past with a lot of parts made up specially, to some extent, for new companies who have failed. Business is better, so they are not obliged to accept long chances, and unless a satisfactory rating can be shown insist on a deposit or guarantee of the financially sound parent company, or of some of the individuals of the company who are personally worth the amount of the contract. In vain the business manager points out the rosy future, the wealth of the men "back of the company," the large business which will be placed next year, and so on. The parts manufacturer is unmoved, as he has heard it all before. Some of the contracts are finally closed on various compromises of terms, while others are refused, and the engineer is told to look further for certain parts. In the meantime his options have expired, the parts companies have taken on more business, and what he finally is able to select that his company can buy again throws his design out of balance.

#### MISFITS.

The principal parts once secured, the engineer can turn his attention to details of their construction which previously he has been, to some extent, obliged to neglect. He finds, for example, the hub caps on the front and rear axles do not match, that his front hubs come drilled for twelve snokes and his wheels with ten spokes; that the steering arm on the front axle has a one inch ball, and on the steering column lever a 11/4 inch ball; water piping on the engine doesn't match the radiator, the universal joint doesn't fit the pinion shaft on the axle, and the rear bearing of the transmission is not large enough to take the torque of the braking and driving strains. It seems that nothing is properly designed, and he blames the parts makers for their seeming inconsistency, and yet they are naturally furnishing what their experience shows is most generally required. The inherent trouble lies in the fact that the various parts were not designed to be used together. Many troubles could have been avoided by proper engineering specifications when contracts were closed, and would have been by the experienced engineer. Nor are all the difficulties discovered when the first cars are assembled. With use more serious troubles develop. The brakes will not hold and the axle is blamed, yet it is probable that the arrangement of levers is wrong, and is entirely beyond the control of the axle manufacturer. Some of the lighter parts begin to fail, the clutch is too "fierce" for the transmission gears, the car is too heavy for the

springs perhaps, and other troubles which only develop with use of the car.

#### GRADUAL DEVELOPMENT NECESSARY.

During the first season much can be done to remedy and soften the most glaring inconsistencies and effects by an experienced organization, and here again the experienced engineer is of value. Secondary only to the first design of an assembled car is its development. None of the high grade cars of the present time were developed in a single season. They are the result of much thought and experiment extending over several seasons, not only of the engineer but of the whole organization. It is essential then that the business organization have a commercial knowledge of the industry if they are to assist in the development of their car. It is likewise essential that the factory and the factory organization assist in the development.

#### THE PROBLEM OF DELIVERY.

Then there is the problem of delivery to be considered—of vital importance at the present time. Unavoidably, perhaps, a single unit is delayed, and as effectually holds up the delivery of cars as though all the parts were lacking. In the meantime other parts are coming in according to contract, and must be paid for, and considerably more money is found necessary than was at first contemplated. Indeed, the assembled car manufacturer is completely in the parts manufacturers' hands, and non-delivery, poor design or poor material in any one of a dozen units may go far toward wrecking the business for an entire season.

In briefly mentioning a few of the difficulties  $\epsilon$ f the assembled car business no mention has been made of the factory and small equipment necessary for assembling. To have this work intelligently and economically done, considerable study, expense and time must be devoted to the organization as a whole, to the assembling fixtures and methods, and to the manufacture of the many miscellaneous small parts which are difficult to buy outside.

#### OBJECT NOT TO DISCOURAGE.

It is not the object of this article to try and discourage new companies from entering the automobile field through the open door of the assembled car or the branching out of companies in other lines of business into the automobile industry, but rather to point out briefly that real difficulties are to be expected, and must be overcome if anything like satisfactory results are to be obtained.

To attempt to treat fully the problem of building a car from standard parts from the business, engineering and manufacturing standpoints, from the building of the model car to the furnishing of repairs for the stock cars, would make too long a story. Possibly enough has been said to convey the fact that the problem is not as easy as at first appears; that business, engineering and manufacturing experience, as well as factory equipment, in this line of business is essential to success, and above all that intangible asset called organization, or team work, which is seldom appreciated until missed, must be developed.

It takes brains, time and money to get this equipment even for the building of assembled cars, and therein lies a real difficulty which is often ignored by the newly formed company. With such an equipment, and with sound financial backing, there is no doubt that the assembled car can be made a success.

# Extra Losses in Transmission on Rough Roads and Curves.

#### By Albert L. Clough.

In the discussion of the manner in which the power developed by a vehicle motor is expended much has been written in regard to the absorption of energy by normal tractive resistance, air resistance and hill climbing. Efficiency tests of transmission elements have, moreover, thrown light upon the magnitude of the energy wastes due to these parts. There are, however, a few energy consuming factors of minor importance, to which very little consideration is usually paid, but which are not entirely to be ignored.

So long as a car is moving at a constant speed the energy which was absorbed in bringing it up to that speed—the energy of acceleration, or the kinetic energy of the car—is stored in the moving vehicle, and there is no further call for energy for this purpose so long as the condition of uniform speed persists.

LOSS IN ACCELERATIONS AND RETARDATIONS.

The energy represented by the motion of a 3,000 pound car moving at the rate of 10 miles per hour, or its  $\frac{W v^2}{2R}$ , amounts to

about 10,000 foot-pounds, and this amount of energy represents the expenditure of about 18 horse power for a period of one second. That is, in order to accelerate such a car from rest to a 10 mile per hour speed, in one second of time, the motor will be required to deliver energy for this purpose at the average rate of 18 horse power.

In order to accelerate the same car from rest to a speed of 40 miles per hour, on the level, the expenditure of about 29.0 horse power for 10.0 seconds is demanded—the power required to overcome all resistances being ignored in this discussion.

If it were practicable to drive for long distances at a uniform speed the energy of acceleration would be hardly worth talking about, but this is not usually the case. In driving through crowded traffic, with any regard to "making time." the progress of a car consists of a succession of reductions of speed by means of the brakes and of accelerations. The same is true of a car traversing roads on which are frequent hummocks and pitch holes, which must be negotiated at slow speed.

If the car must be slowed down to 5 miles per hour for each of these and speeded up to 15 miles per hour over the smooth spaces between them, at each repetition of this manœuvre an expenditure of about 7 horse power for five seconds is required. If the slowdowns are sufficiently numerous the aggregate of the energy thus called for amounts to something not at all negligible.

Another case in which the energy of acceleration becomes of substantial moment is in delivery service with very frequent stops. With electric vehicles the call for energy to effect acceleration is a rather serious matter, and an excessive number of stops and starts vitally reduces the mileage obtainable from a charge. Of course, if a car is allowed to "drift" up to the stopping point by withdrawing the clutch, and the brakes are not applied, the energy of ac celeration is not wasted but is usefully returned in keeping the car in motion for some time after power has been cut off. Slowing down a gasoline car by closing the throttle or retarding the spark, or both. is, in effect, the same as applying the mechanical brakes.

#### TURNING CURVES.

When a car turns from one street into another intersecting it at right angles, it usually traverses approximately a circular quadrant which is tangential to its initial and final straight paths. Under these circumstances there is no direct drain upon the store of dynamic energy in the car. That is, if the wheels do not slip and if there be no increase of frictional resistances there will be no diminution of the kinetic energy of the moving mass. In practice, however, these conditions are not realized. The centrifugal force acting normally to the circular path at the centre of gravity of the car acts to cramp the front wheels on their bearings and to bring added pressure upon the thrust bearings in the rear axle, thus causing unusual frictional losses at these points. In the case of a car with its weight equally distributed upon its four wheels, drifting around a corner so that its centre of gravity makes a circular arc of 50 feet radius and at a speed of 9.83 feet per second, or 6.7 miles per hour, the centrifugal force acting amounts to 1,800 pounds, and each front wheel is subjected to a side pressure of 450 pounds, tending to cause abnormal friction at its bearings, while the rear axle thrust bearings have to carry an abnormal stress of 900 pounds.

The above speed is taken as an example, because it is the highest speed at which such a car can turn upon a flat macadam road under the imposed conditions without slippage of the wheels taking place, under the assumption that the coefficient of adhesion is 0.6, as will be seen from the following considerations: The adhesion of the car is 0.6 W, where W is the car weight, in pounds, and the centrifugal force acting, in pounds, is  $\frac{W v^2}{g r}$ , where v is the speed

of the car in feet per second, r is the radius of the path in feet and g has its customary significance. When car adhesion and centrifugal force are equal the vehicle is upon the point of slipping sidewise.

0.6 W = 
$$\frac{W}{gr}$$
 · · · 0.6 =  $\frac{v^3}{gr}$  · · ·  $v^3$  = 0.6  $gr$   
· · ·  $v^2$  = 0.6 × 32.16 × 50 = 965. · · ·  $v$   
= 9.83 f. p. s. = 6.7 m. p. h.

Beyond this speed there will be a loss of energy due to slippage. Suppose a car to be "drifting" at such a speed that it slips bodily sidewise 2 feet out of its natural path in making such a turn, and assume that the coefficient of friction of its tires on the road remains the same as the coefficient of adhesion. The work done in such a slippage in the case of a 3,000 pound car will be

 $0.6 \times 3000 \times 2 = 3600$  foot-pounds, and about 6.5 horse power will have to be applied to the wheels for one second to replace the energy which has been withdrawn from that stored in the form of vehicle motion.

It is hardly practicable to evaluate the

energy loss due to increased friction in rounding curves, but it is considerable even with the best anti-friction bearings.

#### DIFFERENTIAL GEAR LOSSES.

So long as a car is drifting in a curved path the differential gear is in action regulating the angular velocities of the rear wheels to fit their respective paths, but the only load which it is transmitting is that occasioned by the friction of its own parts, of the driving gear, the propeller shaft, universal joints, the gears of the transmission and the clutch bearings. If the car is being driven around a curve, under power, the differential gear is actually transmitting energy to the wheels, and is thus operating under load. So far as can be recollected no tests of differential gear efficiencies have been published for various loads and various speed ratios of the two rear axle shafts. It is safe to say that the losses in the differential are quite heavy, especially when transmitting considerable energy to the wheels of a car moying in curves of small radius. At any rate it is rather general practice to declutch just before turning a sharp corner, and to "pick up" the lost speed when the straightaway is again reached, in order to avoid working the differential under load.

The fact that in making a turn abnormal bearing stresses and the tendency to slip are inversely as the radius of the curve and directly as the square of the speed is the obvious explanation of the almost instinctive action of every driver in making as broad a turn as possible and slowing down. Modern traffic regulations allow the left hand turn to be made on a much larger radius than the right hand turn. Following excessively winding rutted roads calls for quite an expenditure of power. There is a considerable increase of bearing friction due to side stresses upon the wheels, and a considerable loss from the friction of the sides of the tires upon the walls of the ruts. The differential, too, is rather busy under these conditions.

#### SLIPPING OF WHEELS.

If the drive wheels of a car slip upon the roadway in their own plane by a certain percentage, just that percentage of the energy transmitted to them from the motor is lost as heat in the tires. Experiments have shown that at ordinary driving speeds over good roads in normal condition the percentage of slip is very small. At racing speeds, however, it is rather a large matter. In deep sand and in mud the percentage of slip may be large at ordinary speeds, and may even be total. Where it is total, the tractive resistance of the car is greater than the force of adhesion of the driving wheels. It would be interesting to obtain some idea of the rate of slip in excessively heavy sand by applying an odometer to the rear as well as the front wheels, and noting the difference in their readings. Some researches upon driving wheel ship have been made in connection with taxicab service, and taximeters are now generally driven by the front wheels, so that no injustice may be done patrons by charging them for the useless slip of the rear wheels on slippery roads.

#### SPRING LOSSES.

When a vehicle is driven over a generally level but smoothly undulating road surface, the draft of energy required to carry the car up the rises is replaced by the coasting tendency due to the corresponding declines, frictional losses being excepted. This is true, however, only when the spring supported parts of the car do not move relatively to the running gear. If spring movements occur there is a loss of energy, for all motion of the spring supported parts is finally damped by the friction of the springs themselves, or by the shock absorbing devices used in connection with them. The absorption of power by spring movements is not readily evaluated, but constitutes a considerable loss of energy on rough roads. If the spring supported parts of a car weigh 2,500 pounds, and a road irregularity gives rise to a total change of position of 4 inches between the centre of gravity of the car and the running gear, it is plain that more than 825 foot-pounds are absorbed by this action, this figure representing the energy required to lift the spring supported parts from their lowest to their highest position against gravity. Nearly two horse power must be applied for a second in order to replace the energy thus lost in heating the springs and shock absorbers, and in reality rather more than this. Side sways of the body also absorb energy, and in fact none of the work transmitted to the springs is ever recovered.

#### MISALIGNMENT OF BEARINGS.

Efficiency tests of transmission parts as performed in the laboratory are almost always made with the elements rigidly held in perfect alignment. In practice, despite the use of universal joints, some misalignment is likely to occur when a car is driven over rough roads. Such misalignments account for losses much in excess of those indicated by laboratory experiments, especially in the universal joints.

Movements of the rear axle relatively to the rest of the car result in changes in the angular speed of the rear wheels, whether chain or shaft drive is employed, and these actions are a source of wheel slip, and of abnormal stresses in the transmission element which become of importance when a car traverses rough highways.

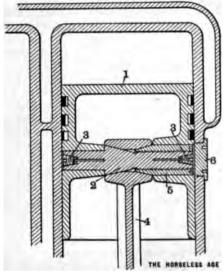

This subject was ably treated in three articles by S. Gerster, published in Volume XIX of this journal, on pages 391, 432 and 463, which will be found worthy of a rereading in this connection.

One generalization which may obviously be made in connection with the preceding subject matter is that, in the main, all these causes of energy loss are present on crooked and rough roads, and absent on smooth, straight roads. No one can tell how much the rough road is costing those who drive automobiles, but it is certain that it constitutes a source of enormous economic waste.

### Adjustable Piston Pin and Valve Plunger Designs.

By W. F. Cooper.

The following described constructions are the result of some experiments of the writer in endeavoring to provide means for taking up the wear which occurs in the bearings and some of the other parts of motor cars. I have been considerably interested in observing the apparent tendency of some of the more prominent manufacturers to abandon non-adjustable features. This is a point which I believe has been greatly neglected,

' Fig. 1.

and it would certainly appear that if a motor car is going to be anything other than an expensive luxury means should be provided for taking up this wear, so that it will not be necessary for the owner to invest in a new car every second or third year at the most.

Two of the parts which are probably subject to the most wear, and wear that is least easily taken up, are the piston pin and the push rod, sometimes termed the valve plunger, as used in the four cycle engine. This valve rod is that part which operates upon the bottom of the valve to lift the same, and is generally provided with a roller or disc portion on the bottom upon which the cams act when raising the valves. To overcome this objection to these parts I have designed adjustable bearings for the same. Both of these constructions have been made and used by the writer, and have proved to be practical and easy to adjust.

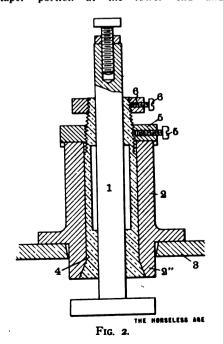

In Fig. 1 is shown the upper portion of the cylinder and piston. The piston 1 is provided with slightly larger bosses or bearings for the piston pin 2 than usual. This piston pin is split at each end and provided with taper socket set screws 3, for expanding the ends of the pin and fastening it firmly in place. When properly fitted I have found this construction to hold the pin so there is no possibility of movement.

This piston pin is provided with a taper shoulder portion which forms one-half the bearing of the connecting rod 4, the other half of the connecting rod bearing upon the oppositely tapered portion of the sleeve 5, this sleeve being threaded upon and forming a part of the piston pin. This sleeve is split lengthwise about up to its bearing portion to permit of a slight expansive movement by the set screw 3. This sleeve is provided with sockets, enabling adjustment of same when the piston is lowered to its lowest position, when the removable plug 6 is taken out. I find that with a properly shaped spanner wrench this adjustment is very readily accomplished in a few moments. I find that the slight side movement of the connecting rod, which may occur in adjusting, is very readily taken up by the slight side play which it is necessary to provide in the crank bearing.

It has been my experience that the piston pin bearing is more liable to wear than any other portion of the motor, and I believe there is no part so difficult to adjust in the average constructed motor.

The sliding motion of the cam rod makes it a particularly difficult bearing to adjust, and I believe there are no cars on the market which provide means for adjusting this part.

In the writer's construction, Fig. 2, the cam rod I is provided with the usual bearing portion for the same, 2. This bearing is attached to the crank case 3 and is centred therein by a shoulder portion 2", this shoulder portion being made large enough to permit of a ready removal up through the crank case, of the push rod and bearing, including its lower disc or roller portion, when necessary. The cam rod bushing is split its entire length and has a taper portion at the lower end and

a nut 5 having a square thread for drawing this sleeve upward and adjusting the lower portion of the bearing. The upper portion of the bearing is similarly adjusted by a taper threaded nut 6. These nuts are fastened by set screws 5' and 6' This construction was made by the writer and found to be extremely practical.

Fig. 3 shows a modification of this structure in which the bushing is screwed with

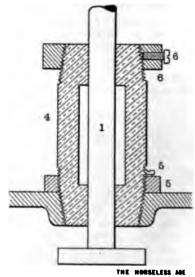

FIG. 3.

a tapered thread into the crank case, and dispenses entirely with the outer portion of the cam rod bearing, the bushing itself being made heavy enough to constitute the complete bearing. Though not constructed by the writer, I believe this would be easily effective. Would add that the adjustable construction for the piston pin shown would obviously not be applicable to four cylinders cast en bloc on account of limited space when they were previously designed for this construction.

#### Automobiles in Denmark.

According to the registration records. there were 699 automobiles and 3.418 motorcycles in service in Denmark on September 1, 1909. Of the automobiles 375 were owned in Copenhagen (138 of these heing motor cabs) and 42 in Frederikshorg. Disregarding the cars owned in Copenhagen, 151 are owned in Jutland and 131 on the islands of the kingdom. Of the latter 81 are owned in cities and 50 in the country. For Jutland the corresponding figures are III and 40. Of the 3,418 motorcycles, 516 are owned in Copenhagen, 157 in Frederiksborg, 1,415 on the islands (exclusive of Copenhagen) and 1,313 in Jutland. Of the 1,415 motorcycles in the islands, 672 are owned in the cities and 743 in the country, the corresponding figures for Jutland being 603 in the cities and 727 in the country.

#### THE HORSELESS AGE

Founded in 1895 by E. P. Ingersoll. Every Wednesday.

Published by The Horseless Age Company.

Fred J. Wagner, Charles B. Ames,
President. Treasurer.
9-15 Murray Street, New York City.

EDITORIAL STAFF.

J. T. Coventry.

SUBSCRIPTIONS (payable in advance), DOMESTIC, \$2.00 a year; CANADA, \$3.00. All other foreign countries included in the Postal Union, \$4.00. Single copies, 10 cents.

BRENTANO'S, 37 Avenue de l'Opéra, Paris.

COMMUNICATIONS.—The Editor will be pleased to receive communications on trade topics from any authentic source. The correspondent's name shuold in all cases be given as an evidence of good faith, but will not be published if specially requested.

Address all communications and make all checks, drafts and money orders payable to THE Horse-LESS AGE, 9-15 Murray street, New York.

Entered at the New York post office as secondclass matter.

One week's notice is required for change of advertisements.

Telephone: 7195 Barclay.

Cable: "Horseless." New York and London.

Western Union Code.

#### Mathematical Articles.

Now and then we publish in THE HORSE-LESS Age an article on some technical subject in which mathematics is used to a considerable extent. We do not believe that on the average there is as much as two pages out of the thirty which we generally run that can in any sense be called mathematical, yet this small amount seems to loom very large to some readers who eschew mathematics-to judge by their protests. We have in mind particularly two recent letters. One of the writers, in renewing his subscription, says that "the average automobile man has not the education, or if he has the qualification he has not the time, to follow out the calculations we see so much in your journal. He wants to get at the conclusion, and often when reading the calculations is left in doubt as to the conclusion."

Another, writing in a jocular vein to one of the proprietors, thinks that the high browed professors among the readers are given too much consideration, and the low browed element is neglected. He also refers particularly to mathematical articles, and voices the opinion that there must be a way of expressing the same thing in ordinary language, without recourse to mathematics, so as to make it intelligible to the average non-mathematical reader.

That this bias against mathematics, as we might call it, is not peculiar to readers of this publication was brought home to us very strongly a few weeks ago when the American Machinist printed an editorial in which the view was expressed that mathematical articles had on non-mathematical readers something of the same effect as the proverbial red rag on a bull.

Our own view of the matter has been that mathematical articles interest only a small class of our readers, but that these are the men who most strongly influence the progress of design, and therefore deserve recognition. There is no such person as an average reader. Our readers range all the way from the novice, who does not yet know a differential gear from a universal joint, to the most expert technical men. It would be impracticable to try to print only matter of interest to one particular class, because to do so would mean neglect of all other classes. What we do attempt to accomplish is to offer something of interest to every class of men concerned with automobiles. This field is certainly none too broad. There is such a thing as specialization overdone. The modern metropolitan newspaper has its various departments, its sporting, theatrical, real estate, financial and other sections, and nobody nowadays buys a newspaper with the expectation that all of its contents shall be of interest to him. Why should anybody expect this of a trade or class paper? Human interests and inclinations are too much diversified to permit of this.

In answer to the observation that everything expressed by mathematical formula ought to be capable of expression in ordinary non-mathematical terms, we would say that it is, but non-mathematical treatment of involved technical subjects is generally extremely awkward and wasteful of space. It would be like drawing up a bill for goods without the use of numerals. This can also be done, but such a bill could not be recommended for clearness and handiness. The root of the trouble, however, is not that the treatment of the subjects is unintelligible to a good many readers, but that the subjects themselves are of no di-

rect interest to them. Take, for instance, the series on the "Calculation of Chassis Springs" which has just been concluded. It contained only elementary mathematics, but a good many formulæ and a good deal of tabular matter, neither of which classes of reading matter is exactly adapted for self entertainment. To strain a point, this subject could also be treated largely or entirely without the use of mathematical symbols, but not to any advantage, so far as we can see. The great body of automobile owners, numbers of whom read THE HORSELESS AGE on account of its serious tone and brevity of expression ("more automobile facts to the square inch than in any other publication," as a recently received letter aptly expressed it), do not want to learn to calculate spring sizes, nor do the many garage men, salesmen, repair men, etc. Such involved problems as spring calculations, for instance, will always be referred for solution to relatively small classes of experts.

It is therefore our view that while only a limited amount of space can be given to such matters, they should not be entirely neglected, as not only the experts but the whole automobile community profit from the technical advancement resulting from the discussion of these problems of construction in the trade press. This view, we must confess, is based more or less upon our own personal inclinations, and not upon any very comprehensive inquiry into the tastes, preferences and requirements of our readers. And here we might state that our aim is to make a paper of "the greatest good to the greatest number" of our readers. That there are some among our subscribers who read mathematical articles we know from the fact that almost every more important article of this class is followed by a discussion in our Comments and Queries from Readers. That many, on the contrary, consider these articles useless and superfluous we know from letters of friendly criticism and casual remarks dropped by our correspondents. So far as direct commendatory remarks on mathematical articles are concerned we must confess that practically none have ever come to our ears, though we presume that this is due to the fact that the technically trained engineer regards it as a matter of course that such articles should appear in a technical paper. Counting, therefore, only direct pro and contra evidence as to the popularity of mathematical articles, the weight of evidence is largely contra, and this naturally tends to incline us to discontinue publishing such articles. If, then, there are those among our subscribers who read and appreciate these articles, and consequently wish to see them continued, let them send us a brief statement bearing on the value of these articles to them and to the industry in general. If we receive such letters in any number we shall know for sure that the space given to mathematical discussions is not wasted.

#### Providing Against Forgetfulness.

Human fallibility in the matter of properly maintaining the supplies carried by a car is a quality always to be reckoned with, and considerable ingenuity has been devoted to expedients by which the annoyance and delay resulting from forgetfulness or slackness upon the part of the operator in this regard may be avoided.

The installation upon a car of more than one source of electrical energy for ignition purposes, one or more of which sources it is intended shall be used mainly at least as reserve supplies, is a case in point.

Another common instance is the reserve fuel supply, contained in a separate compartment of the main tank, communicating with the carburetor through a separate valve normally kept closed. Even though no reserve tank is provided upon a car, the market affords strong, compact hermetically sealed, portable tanks holding about I gallon each, one of which may be kept filled in the carrying space of the car for emergency use.

The "reserve" idea has also been applied to the lubricating oil supply. Realizing the annoyance and possible damage which may arise from the exhaustion of the regular supply of oil normally contained in the lubricating system, a supplementary or emergency supply is provided upon certain makes of cars. This secondary supply may be contained in a tank located under the hood, fastened to one of the frame members, upon the running board or elsewhere, which is usually piped to the engine lubricating system. Gravity may be depended upon to draw the oil from the tank, but more often a hand pump is provided. Moreover, certain oil makers are furnishing their product in packages of convenient and attractive form, fitted with straps for attachment to the running board, thus permitting of the ready carrying of an emergency supply.

One manufacturer of gas tanks for vehicle lighting has applied the "reserve"

principle to this branch of automobile service by bringing out a cylinder of acetylene gas under pressure of such small size and convenient shape that one may readily be carried at all times in the tool box or luggage space. In event of the exhaustion of the regular gas supply, this small emergency tank is readily attached to the lamp piping by means of rubber tubing, and quite a number of hours of illumination are thus provided, sufficient to permit the car to reach a point where the discharged gas tank may be exchanged for a fresh one.

In the practical application of the "reserve" principle, it is essential that the reserve supply shall be properly maintained at all times, that it shall never be drawn upon unless actually required, and that if drawn upon it shall be at once replenished. If these rules are disregarded the good offices of the system cannot be realized with any degree of certainty.

#### Easily Operated Clutches.

In reading the published descriptions of the new models it will be observed that increased attention has been paid to reducing the muscular exertion required in releasing the clutch.

Improvement along this line will be welcome, especially considering the fact that certain cars, even of rather late design, have been equipped with clutches of notoriously hard operation.

The driving of an automobile should be almost entirely a matter of intelligence rather than brawn, and there is little excuse for the use of control devices the operation of which is unduly fatiguing when continued for considerable periods.

Now that women are generally beginning to drive gasoline cars it is more than ever before desirable that control devices should operate with only moderate effort, one of the main arguments for the safety of the automobile in the hands of women drivers being that, unlike the "hard bitted" horse, its control is within the muscular ability of the sex.

Easy clutch disengagement may be brought about by so designing the clutch that the engaging spring pressure may be reduced by increasing the leverage between the pedal and the movable clutch member and by reducing the friction of the operating linkage.

Manufacturers using multiple disc clutches are able to reduce the spring pressure required, by increasing the number of discs used, or by the use of discs of materials possessing higher frictional coefficients. Those employing other forms of clutches most naturally turn to an increase of pedal leverage as the readiest solution of the problem.

However obtained, an easily disengaged clutch adds greatly to the pleasure of driving a car, especially when long trips or service in congested traffic are undertaken.

# Changing Popularity of Body Styles.

There are signs which indicate that the roadster type of body is at present considerably less popular than it was a year or two ago. At present the average manufacturer probably lists a greater number of different body styles than ever before in the history of the industry, and individual taste should be more readily satisfied than ever before. Among these styles of body is, of course, the roadster, with its various arrangements of rear seats, but this style appears not to retain its former relative importance. Apparently its place is being taken, to quite an extent, by the small tonneau, either detachable or fixed, which is known by the names "toy tonneau," "demitonneau," and so forth.

It may be that the erstwhile popularity of the roadster type was founded more largely upon mere fashion than upon any inherent merit.

Undoubtedly the roadster, with rumble seats, is fairly satisfactory when the use of the rear seat is of an entirely incidental character and for very short distances, but for long rides it is ill adapted in every way. The small tonneau seats the same number of passengers as the double rumble seat, but carries them comfortably and securely. As the automobile becomes more and more a humdrum vehicle of everyday utility, comfort and utility may be expected to become the main factors in the choice of body styles, and the desire after the sporty and unusual will exert less influence. Perhaps the surrey type, which furnishes rear seating accommodations of a character intermediate between the double rumble and the toy tonneau, may be found to meet the requirements of those who desire a light and handy rear body design which still affords the necessary degree of comfort and security.

The German Imperial Automobile Club will celebrate the tenth anniversary of its foundation by a banquet in the banquet hall of the Restaurant Rheingold, in Berlin, on January 15 next.

### MAINTENANCE AND REPAIRS.

# How Covers and Tubes Are Vulcanized.

By JAY TEEL

Having been asked by a friend for some instructions for operating small vulcanizers, I thought that our tire experiences of the last five years might be interesting to others also. In August, 1904, there came into our possession a slightly used heavy runabout. It weighed about 1,400 pounds, and was equipped with 30x3 inch clincher tires of a well known American make. Our first tire trouble occurred the first day after we received the car, a tire being found flat. It was only a tiny puncture, however, and was soon patched. We then had no tire trouble for some time, which rather surprised us, as our friends had been telling us what enormous tire bills all automobilists had. Our next trouble was from a small hole clear through one of the rear casings. We noticed it for some time, but as it was on the side well up toward the rim, where it never could touch the ground. and the superintendent of an automobile concern who had been visiting us had said that they "never thought anything of such little things," we paid no attention to it.

One day we put on the surrey seat and started for quite a spin with four persons on board." We drove about 6 or 8 miles, and then stopped at an attractive spot to enjoy the scenery. One of the party happened to glance at the tire, and noticed that the hole had become much larger, and the inner tube was bulging through it. Apparently it was only a matter of a short time when we would have a blow out on our hands.

We backed the car up to the side of the road, jacked up the wheel, deflated the tire, and were wondering what to do next when an old horse doctor in a steam runabout happened along. He examined the tire, expressed his regret at being unable to help us, and advised us to go home on the rim. As we had nothing in the shape of a tire kit but two small irons, cement and inner tube patches, we thought for a while that this was the only thing to do. Finally, however, we ripped a piece of rubber off the floor and beveled the edges with a jack knife. This was inserted in the casing to cover the hole. The tire was then pumped up, and by dint of careful driving we reached home without any trouble from it.

#### OBTAINED A VULCANIZER.

Our next job was to repair the casing. We had heard a good deal of the small vulcanizers which work with the tire on the rim and determined to get one. We obtained one of these but without the accessories which usually come with such vulcanizers.

We had a "binding rod" made to hold the vulcanizer onto the wheel, but found that it would only fit when holding the vulcanizer at the very middle of the tread. It was discarded for a small chain. By means of small pieces of wire one end was fastened to the hole on one side of the vulcanizer, and the other end to a small bolt passing through the other. A centigrade thermometer, similar to a clinical thermometer, but larger in diameter and about 51/2 inches long, was procured from a firm in Rochester, N. Y. For a source of heat we have used various things. A Bunsen gas burner, supplied by 50 feet or more of rubber tubing, running to the garage from a gas jet in the house, probably gives the most all around satisfaction.

Place the burner on a box under the vulcanizer. Regulate the temperature by varying the amount of air admitted to the burner by regulating the amount of gas admitted by means of a cock placed in the line near the burner, and by placing a small piece of metal on top of the vulcanizer as a draft check. Gasoline and alcohol torches have also been used. Next to gas they probably give the best satisfaction. If anyone should while on tour be away from civilization so long as to make it seem advisable to carry a vulcanizing kit, a Bunsen burner could probably be supplied with gas from the gas tank or generator. This need only be used until the required temperature is reached when it may be replaced by the burner of a kerosene lamp.

#### MATERIALS REQUIRED.

For material we sent to a bicycle dealer for a pound of crude rubber and a pint of Goodrich vulcanizing cement. The dealer very kindly sent instructions for their use. The method of procedure in this particular instance was about as follows:

The canvas and rubber in the vicinity of the hole were first thoroughly cleaned by means of a new file, and then a brush wet with gasoline. With the aid of a shoemaker's awl a piece of canvas was then sewn over the hole from the inside. This was done with linen carpet thread and an upholstery needle. Cement was then spread liberally over this and the adjoining surfaces from the outside. The hole was then filled with alternate layers of rubber and thin pongee silk. The top and bottom layers were considerably larger than the hole. The patch was covered with talc powder; a postcard with a hole cut just large enough to fit the patch was put on, and the vulcanizer was applied. Owing to the thickness of the patch a temperature of about 160° C. was kept up for an hour and a half.

#### CEMENT.

We soon found out that the gum rubber we were using was not the proper material. It appeared to be similar to what elastic bands are made of. Pongee silk, also, is not so suited to such work as cotton duck. We sent to the makers of our tires and bought some of their vulcanizing stock and cement. It might be mentioned that we were charged for this about one-third of what we paid for the first lot. This rubber was their own secret compound, discovered, as they said, when they were preparing tires for the Vanderbilt Cup race. The service it gives seems to be very good. The cement, they said, was merely pure gum rubber dissolved in gasoline. We found these materials very satisfactory, except that we prefer the vulcanizing stock, dissolved in gasoline, to the regular cement. It might be mentioned here that the Goodrich cement seemed to be about the same as the other except

TREAD PULLED LOOSE.

CEMENTED DOWN.

PATCH APPLIED, READY FOR VULCANIZING.

that it contained a little sulphur or some compound of sulphur.

#### VULCANIZING PATCHES.

When vulcanizing patches on inner tubes, either raw rubber patches may be used or the regular patches may be cemented on with vulcanizing cement and then vulcanized. For inner tubes and patches having but one thickness to be vulcanized 125° C. for twenty-five minutes should be sufficient for properly curing. Thicker patches require a longer time and sometimes a higher temperature in order to cure the cement sufficiently to make a perfect union of the old and new rubber. In some cases it may even be necessary to actually burn the outside of the patch in order to cook the inside properly. If the point of a sharp pencil be forced into a piece of rubber not sufficiently cured, the indentation will remain for some time. If the piece is properly cured the rubber will at once resume its former shape when the pressure is removed. Properly vulcanized rubber has a soft, velvety feeling, while the feeling of over-vulcanized rubber is hard and harsh.

Before applying the vulcanizer to a patch on an outer casing, dust the raw rubber with talc powder and wind tightly with a long strip of canvas three of four inches wide. During this time the tube should be inflated just enough for the tire to be filled out full. Mark out the patch on the canvas with a blue pencil and then apply the vulcanizer. Pump the tire up to full pressure before heating. After vulcanizing do not loosen the vulcanizer for about fifteen minutes, or until it is cool enough to be handled with the bare hands.

#### TOOLS NEEDED.

Aside from the articles already mentioned, few tools are needed for vulcanizing. There should be a suitable knife for beveling the edges of patches which stick up beyond the surface of the tire. This it will do best when heated. A roller should also be provided for smoothing and stretching patches when first applied to a tire. Those who have seen tires made in the exhibits of the Ajax-Grieb Rubber Company at the New York auto shows will readily understand its use. The instrument used by the writer is merely a porcelain insulator (a cylinder with a hole through the middle). Through this is a piece of iron rod, and a wooden file handle is struck on either end. A cobbler's awl is also useful for "calking" cracks with raw rubber.

#### REPAIRING A SAND BLISTER.

Once on coming in from a drive a sand blister was discovered on one of the front tires. It was opened and found to extend around the whole circumference of the tire. The tread was cut open and the canvas and rubber were thoroughly cleaned with a file and gasoline. It was then cemented down and the tire "half soled," i. e., that part of the casing which touches the ground was covered with a continuous strip of new rubber. This was vulcanized

down and the tire was made better than it was before the blister occurred. Now when the rubber of a casing becomes worn down to the canvas it is made almost as good as new by "half soling." By closing all holes and cuts promptly so that the canvas cannot be attacked by water, tires should be made to last indefinitely.

As mentioned before, patches are vulcanized on inner tubes. We adopted this method of repairing punctures after having several patches come off by being pinched by lugs and from being melted by friction or hot weather, and having trouble from finding patching cement all dried up. To vulcanize, clean a section of an outer casing (inflated and on the car) and strap the tube to this. Proceed as with an outer casing. Patches vulcanized properly to inner tubes will not leak and will always stick. As a certain driver for whom we once patched a tube once remarked, "The tire may come off from the patch, but never the patch from the tire." When a hole in a tube is large a patch may be put on the inside with good results.

#### LONG TIRE LIFE.

When we first purchased our machine, we were assured by our friends with all seriousness that "automobiles fairly eat rubber tires." Now, after about five years of careful use the car still stands on its four original casings. Of course, the tires are far from new, but careful driving and frequent attention has left them still able to do their work. Probably the fact that the car has been run only about four hundred miles largely accounts for this.

The following are our tire expenses, as nearly as is known:

September 27, 1904, patches and cement	\$0.15
October 6, 1904, patches and cement	. 58
October 6, 1904, inner tube (for reserve).	5.48
June 6, 1905, one pound crude rubber	2.25
June 6, 1905, one pint Goodrich cement	. 64
June 6, 1905, linen thread	.10
July 20, 1906, valve plungers	. 30
September 1, 1906, one pint Goodrich ce-	
ment	. 64
September 1, 1906, valve plungers	.30
November 1, 1906, one pound vulcanizing	
stock	-75
November 1, 1906, one-half pint cement	. 20
August 10, 1908, 2 pounds vulcanizing	
stock	1.50
Total	\$11.79

#### A Clutch Collar Repair.

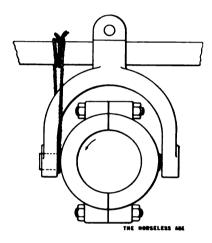

It is always a good plan to frequently oil or grease the clutch shipper collar ring, especially if one habitually keeps his foot on the clutch pedal.

The clutch collar ring having become ladly worn, one of the studs which fit into the clutch yoke broke off close to the ring, allowing the ring to rotate (by the action of the shaft), thus freeing itself from the yoke and rendering it impossible to disengage the clutch. No garage being near, a road repair became necessary.

Some double stranded fence wire being at hand, a piece about 2½ feet long was used, and after the ring had been put in its original position the wire was passed under

the stud, over the end of the fork, and the ends brought up, wrapped in opposite directions around the clutch yoke bar and twisted together. Owing to the wire being very hard to bend, the first attempt was a failure, for there was enough slack to allow the stud to slip out of the fork in the yoke. After the second winding, and with the ring well greased to reduce friction against the shaft collar, the repair served successfully to bring the car safely home, a distance of 10 miles or more. Care was of course, used not to press on the clutch pedal unless the clutch was to be disengaged, and not to disengage the clutch except when absolutely necessary.

In some cars it might have been possible, by throwing the yoke to the rear as far as possible, to rotate the ring (after having removed the grease cup) so that the remaining stud would come into the opposite fork. The shaft would then have

pushed the stud into the fork instead of tending to pull it out, thus relieving the strain on the wire. In this particular case, however, the bolts and shoulders which hold the two valves of the ring together would not permit of it.—Cornelius von E. Mitchell.

#### Refilling Prest-O-Lite Tanks.

The Prest-O-Lite Company, of Indianapolis. Ind., inform us that they have been granted injunctions against three companies, restraining them from further selling Prest-O-Lite tanks filled improperly by themselves or by others as genuine Prest-O-Lite tanks. They state that a number of companies are now being formed throughout the country, and local capital is being interested in attempts at properly refilling Prest-O-Lite cylinders. In the majority of cases the so called high pressure generator is employed, which is claimed to be extremely hazardous and liable to explode at any time. As a matter of fact, reports of explosions at refilling stations have recently been quite numerous in the press. The company are confident that the several suits started by them in Cleveland, Milwankee, St. Louis, Los Angeles and Chicago will be decided in their favor. The outcome is of considerable interest to dealers.

### COMMENTS AND QUERIES OF READERS.

# Calculation of Chassis Springs. Editor Horseless Age:

I think Messrs. Landau and Golden still fail to see the fundamental importance of inclined links, but without doubt will "tumble to it" eventually, even if it is "entirely foreign" to the subject. They say it does not cut much figure if they make the spring flexible enough in the first place, but is a good way to correct a bad spring. Isn't it a much better way to get out one with the correction already made? Messrs. Landau and Golden misinterpreted or fail to understand the meaning of a low stress, and a stiffer or stronger spring for the same flexibility. The writer has no desire to make springs of inferior material and heavier than necessary. This defeats the very object of enclosed links, and I want to be as clear as possible here; in other words, for the same dimension of spring we have 30 per cent. more flexibility with a 60 degree angle than with straight links.

Take a rear spring for a touring car, linked at both ends; first with straight links, then with links at 60 degrees to the vertical.

Springs 50 inches centre to centre (spring clips 4 inches centre to centre, l=23 inches).

Width of springs, 21/4 inches; thickness, one-quarter of an inch.

Free camber, 9 inches (from spring seat to spring eye).

Load, 1,000 pounds. Sixty degree angle of links from vertical.

Calculated 
$$f = \frac{6 P l^3}{n b h^3 E}$$
  
or  $\frac{6 \times 500 \times 23^3}{14 \times 2.25 \times .25^3 \times 30,000,000} = 2.48$   
inches defi.

Calculated 
$$f = \frac{6 \times l^2 \times P(l + p \tan \alpha)}{n b h^3 E}$$

for inclined links,

or 
$$f = \frac{6 \times 23^3 \times 500(23 + 5.5 \times 1.73)}{14 \times 2\frac{1}{4} \times .25^3 \times 30,000,000} = 3.5$$
  
defl.

In looking at the above figures, they must admit that, after all, it is not as foreign to the subject as they would have the writer believe, and the two examples are so startling that the conditions might have been mentioned if not discussed in your articles. These examples are backed by actual tests in the laboratory, on the test machine, with different angles, proper friction allowances, etc., and extended observations from actual severe road tests.

The reference to spring hangers, brackets, etc., is superfluous and quite out of place; but I might point out that the authors omitted to mention the spring clips or the anchor bolts for fastening the spring to the axle. These in some cases shorten the effective length of the spring from 4 to 6 inches. This omission only varies the results as the cube. The spirit of the three articles and of the reply forcibly suggests to

me that it is better to perceive the beam in our own eye before removing the mote in our brother's. It would be rather interesting to hear from other readers, as Messrs. Landau and Golden, with myself, have much yet to learn on calculations of chassis springs.

ARTHUR M. LAYCOCK.

#### Relative Difficulty of Air Cooling in Two Cycle and Four Cycle Motors.

Editor Horseless Age:

Your request for expressions from users of air cooled two cycle engines regarding cooling noted. I have used air cooled engines off and on for years, both types, and of much the same size. My conclusion is that there is very little difference in the amount of cooling needed. I have been showing the air cooled two cycles for the last two summers, and have driven them in our hottest spells and over the hardest kinds of Pennsylvania roads during those hot spells when the dust of the road was unpleasantly hot, and where the hills were miles long. I began with some doubt and hesitation; however, the service given has removed the distrust and substituted a feeling of certainty and satisfaction never equaled by the four cycles, air or water cooled, which I have driven in the past with what seemed to be the utmost confidence. For auto work or up to 6 or 7 horse power per cylinder I find myself preferring the air cooled two cycle engine. I have even gone further than this and designed an air cooler of the two cycle type for aeronautic purposes. The reason why a two cycle cools as well as a four is because it holds the hot gases but 120°. (The exhaust ports, according to Roberts, open about 59 degrees ahead of dead centre. I think this rather early.) The four cycle engine holds more or less of the hot gases for a complete revolution. This is three times as long, but the gases are not so hot as in the two cycle. They are too hot, however, to absorb heat from the cylinder walls, so it is likely that the hot inner skin of the cylinder sends its heat outward during this long time instead of parting with it to the cool new charge as does the two cycle. I think this fact permits one type of engine to cool as readily as the other. I find the hottest part to be in the heads. Have never had any trouble at the exhaust ports, except that sometimes a piston ring will burn fast at the exhaust side, but this experience is not uncommon with water cooled four cycle engines. The warping mentioned I have not found. The greatest pressure occurs when the piston is in the cylinder head, and up there the cylinder is machined inside and out and is more perfectly cylindrical than a four cycle. Further, I place the engine in a slightly inclined position with the inlet side on top. This lets the cool air strike the hot head and under side, but not the cool upper side. It does much to maintain the walls at a like temperature.

CHARLES E. DURYEA.

### Increased Cylinder Wall Thickness and Fuel Economy.

Editor Horseless Age:

In order to obviate the rapid evaporation and the necessity of frequently replenishing the water supply in the cooling system of an automobile there must be a sufficiently rapid circulation, and a liberally proportioned radiator to prevent the temperature of the water from rising too high. The question which arises in my mind is whether this does not in some cases result in cooling the cylinder too much to produce the best results in fuel consumption. The manufacturers of air cooled engines make a special claim to keeping the cylinder of their engines at a temperature better adapted to secure economy in fuel consumption than can be attained with the ordinary water cooled engine, and from the tests that the air cooled machines show there would seem to be some evidence to support such statements. In the case of a stationary engine, where the flow of water through the jackets can be readily controlled, there should not be so much difficulty in securing a suitable working temperature in the jacket, but the operation even of stationary engines, it seems to me, might in some cases be much improved by attention to a detail concerning which I am unable to find much, if any, information.

The function of the water jacket—or of any other device for cooling the cylinder—is to prevent the heat of the metal from rising to such a degree as to impair the lubrication, and also to prevent preignition of the charge; if the metal is cooled too much a portion of the heat of combustion is wasted by being uselessly conducted away. In a water cooled cylinder the temperature of the water cannot well be allowed to rise above 212° Fahr., but this temperature of the jacket water might conceivably result in cooling the metal too much, particularly if the cylinder bore is small and the walls thin.

In Kent's "Mechanical Engineer's Pocket Book," sixth edition, page 468, is a section on "Conduction and Convection of Heat," in which he gives the quantity of heat in thermal units transmitted per square foot per hour by conduction through a layer of

material as  $q = \frac{T^1 - T}{rx}$ , where  $T^1$  is the

higher temperature, on one side of the layer; T the lower temperature, on the other side; r the "internal thermal resistance" of the substance and x the thickness

of the substance. From this formula it will be seen that the quantity of thermal units conducted away varies inversely as the thickness of the layer of material.

Without going into a numerical example here it would seem that by merely making the cylinder walls of automobile engines strong enough to withstand the ordinary working pressures, the fact that they might be made somewhat thicker, and thus considerable loss of heat by conduction to the jacket water prevented, has been lost sight of. If there is anything to support the contention of the air cooled engine advocates that most water cooled engines are too cool to secure the best results in fuel economy, it would seem desirable to increase the thickness of the cylinder walls, and thus to prevent the too rapid conduction of the heat of combustion to the jacket water. If made too thick the temperature of the inside of the cylinders would be too high; but it would seem that by following the methods of determining the thickness necessary to withstand ordinary working pressures, as disclosed in works on machine design, there would hardly be thickness enough to prevent quite an amount of unecessary loss by conduction of the internal heat. With very large stationary engine cylinders this difficulty would be less manifest. In fact, the difficulty in extremely large cylinders would doubtless be of exactly the opposite nature.

Perhaps you or some of your readers can enlighten me as to the method employed for determining the proper thickness of the cylinder walls best adapted to prevent unnecessary loss of heat by conduction to the jacket water.

ABRAHAM B. Cox.

[Your theory is probably not without foundation, but we doubt whether it will ever be practically applied in automobile construction, for the reason that too much cooling effect is not nearly so troublesome as too little. We believe that the majority of owners would prefer the assurance of dependable cooling under all circumstances to the saving in fuel that might be effected by the changes in design referred to. Besides there is the additional weight to be considered. The only possible method of determining the proper thickness of the cylinder walls to secure maximum fuel economy would seem to be the experimental one.—ED.]

### Wire Screens in Inlet Pipe. Editor Horseless Age:

"A. L. M." asks about screens. They are advantageous in a two cycle motor. It is quite possible to run without them, but dangerous to do so. Crank case ignitions Burn up the oil, and if continued will let the bearings cut out, and the cylinder walls get so dry that the engine stops because of lack of power to overcome the wall friction. Generally a richer mixture will stop them. But this is not economic nor best. One hundred mesh screen is too fine, as it clogs quickly with road dust. It is true that dust should not get into the carburetor, but it

gets into one's watch, so it is pretty hard to keep it all out. I use 30 mesh and about 30 gauge steel wire, but think that larger mesh and heavier gauge would do just as well. There is no trouble with the present size. It will gum up in time, but is easily burned off over a gas jet and any dirt remaining can be knocked off, leaving the screen clean as when new. One screen is enough ordinarily. I use perforated sheet metal over the gauze so as to prevent its vibration. If the inlet port opens too early the flame will rush back through the gauze and heat it so hot that ignition will take place on the other side of it. In such a case the use of two gauzes is advised. These should be separated so one does not stop the meshes of the other. Later inlet or earlier exhaust opening will lessen backfiring by letting the flame extinguish before the inlet port opens, but one limits the engine speed and the other reduces the power and economy. The screen is therefore the better way. In a four cycle it betters the mixture and helps the economy.

CHAS. E. DURYEA.

### Data on Crank Case and Side Frame Design.

Editor Horseless Age:

I am very much interested in the design and construction of automobiles, particularly in the technical points. I have several works on the subject, but must say that same are very incomplete, and am looking for a complete and concise work of this nature. I want a work that will give the formulæ for figuring out the dimensions of the different parts, and all the parts. The books that I have go about so far and are practically the same. They do, for instance, give the formulæ for figuring out the crank shaft, connecting rod, piston, cylinder walls, cylinders, etc.. but not one of them gives a formula for figuring how thick to make a crank case or the webs in same. Nor does one of them give a formula for figuring out how deep and how thick to make the side bars of the frame.

Can you furnish or give me the name of a book or books that treat the points in question, or have these subjects run in your paper? I have two of your Engineering Numbers (October 2, 1907; December 2, 1909), and must say that the articles are excellent. Have you any other engineering numbers, and if so please give me the dates, so that I can order them? Also please advise me where I can get the information that I want.

C. B.

[We know of no work that treats of the subject of automobile design in a comprehensive and up to date manner, giving formulæ for the calculation of all the different parts. So far as we are aware no formulæ have yet been derived for the calculation of crank case walls and webs, and the dimensions of these parts are generally determined empirically; in other words, more or less by guesswork. An article on crank case design appeared in our issue of November 20, 1907, but contains no formulæ

for the thickness of the walls and webs. An article on the calculation of side frames appeared in our issue of August 26, 1908. While we have published one other engineering number besides the two which you mention, it is now out of print, and we are unable to supply copies of same. We can, however, furnish complete volumes bound.—ED.]

#### Reckless Employers.

Editor Horseless Age:

One reason for reckless driving has not had the attention it deserves; that is, the reckless employer of chauffeurs. He it is that keeps always at the wheel chauffeurs that have been discharged for incompetency or worse, many of them several times.

The writer was the attorney for a large garage in this city, and he came to know of many instances where chauffeurs discharged for drunkenness, theft or reckless driving were hired over and over again, each time by a different employer. In every case of hiring a little inquiry by the employer would have disclosed just what kind of a chauffeur it was. It has frequently happened in many garages that, when the garage informed the employer that his chauffeur had taken his car out on a joy ride the night before, the employer would not believe the garage, but even sometimes took his car away from the garage, at the instance, no doubt, of the joy riding chauffeur. Instances of the foregoing kind could be given by the dozen.

If dry goods men hired clerks who had been discharged by other dry goods men for theft there would be parallel conditions in the dry goods trade. When a private coachman is hired the employer takes great care in looking up his antecedents; but the same care is not shown in hiring a chauffeur.

The consequence is that the tone among chauffeurs is lowered; the efficient chauffeur, though in the majority, cannot make himself felt, as he would were he sure employers would stand by him if he himself stood for efficiency and honestry among chauffeurs

Let the reckless employer of the reckless chauffeur be called to acount.

DE WITT C. MORRELL

#### Quieting Noisy Gears.

Editor Horseless Age:

We note Mr. S. H. Johnson's inquiry in the November 24, 1909, issue of your publication in regard to the above, and would call attention to the Dixon graphite wood fibre grease, for enclosed gears, which is known to the trade as Dixon's No. 688

The Dixon No. 688 is composed of a high grade flake graphite grease with which is incorporated a given amount of finely ground cedar fibre. A resilient, spongy lubricant results that never cakes, and instead of a metallic contact the gear teeth are separated by a thin elastic cushion which makes very quiet running. The wood fibre grease also cushions the gears in

shifting, and the danger of chipping is reduced; it also acts similarly to a sponge and prevents the oils from working out of the case.

The Joseph Dixon Crucible Company, Jersey City, N. J., market this grease in a heavy consistency (so as to meet all conditions), and it is to be thinned to the consistency of the grease which has been found to give best results. Preferably this should be done with one of their lighter non-fibred graphite greases.

JOSEPH DIXON CRUCIBLE COMPANY,

L. H. Snyder.

#### Rebushing or Replacing Worn Valve Guides.

Editor Horseless Age:

As soon as possible will you kindly state through your columns various methods by which worn valve guides may be bushed or otherwise repaired, the guides in this case being cast integral with the cylinder head?

A. C.

[The best plan is probably to cut away the old valve guide entirely, tap a hole in the valve pocket wall and insert a new guide made from bronze bar stock. If the bottom of the valve chamber is flat the guide, after being screwed through the wall, can be secured with a small nut on the inside. This method of making a repair was fully described and illustrated in our issue of August 11, 1909.—Ed.]

#### Size of Tire Valves.

Editor Horseless Age:

Why won't the valve people give us a larger valve with the big tires used nowadays? The bicycle valve seems absurd. Can anyone give one good reason for its use on auto tires? H. H. Woop.

#### Annual Election of A. A. A. Officers.

President Lewis R. Speare, of Boston, Mass., was unanimously re-elected president of the A. A. A. at the first meeting of the new board of directors for 1910, held on December 1 at the Hotel Belmont, in this city. Mr. Speare has been well known in automobile circles throughout New England for many years. His determined efforts in the interest of sane driving and the observation of the rules of the road have resulted in more harmonious relations between automobilists and those who were inclined to be hostile to motor vehicles. Frederick H. Elliott was re-elected secretary for the fourth year.

Following out a suggestion of the directors on the previous day, a new office was created in the board, that of the chairmanship of the executive committee, and to this position A. G. Batchelder was elected. Mr. Batchelder will also be the editor-inchief of the official organ of the association, the American Motorist. A new man will head the contest board for the coming year, Samuel M. Butler, of New York, who, while new to this position in A. A. A.

ranks, is known to all motorists throughout the country for his executive ability and his success in promoting events at various times, as well as successfully conducting several of the largest automobile shows.

John P. Coghlin, of Worcester, Mass., as chairman of the nominating committee, presented the following report as representing the choice of the committee, and all of the officers were unanimously elected. They are:

President, Lewis R. Speare, Boston, Mass.

First vice president, Robert P. Hooper, Philadelphia, Pa.

Second vice president, Frank M. Joyce, Minneapolis, Minn.

Third vice president, F. C. Donald, Chicago, Ill.

Treasurer, H. A. Bonnell, East Orange, N. L.

Secretary, Frederick H. Elliott, New York.

Chairman of the executive committee, A. G. Batchelder, New York.

Chairman of the legislative board, Charles Thaddeus Terry, New York.

Chairman of touring information board, Powell Evans, Philadelphia, Pa.

Chairman of contest board, S. M. Butler, New York.

Chairman of good roads board, George C. Diehl, Buffalo, N. Y.

#### Big Increase in Automobile Exports.

The imports of automobiles into the United States during the month of October last show a slight decline to 144 cars valued at \$290,857, and parts valued at \$84,084, from 179 cars valued at \$327,511 and parts valued at \$54,349 in October, 1908. Of the cars imported last October, 57 were from France, 49 from Italy, 22 from the United Kingdom, 9 from Germany and 7 from other countries. During the ten months ending with October, 1909, there were imported 1,352 cars, valued at \$2,509,271, and parts valued at \$740,455, as compared with 1,135 cars valued at \$2,131,400, and parts valued at \$505,818, during the same period the previous year. Of the 1,352 cars imported during the first ten months of the current year, 781 were from France, 345 from Italy, 86 from the United Kingdom, 84 from Germany and 56 from other coun-

The export returns for October show a heavy increase in the exports of our cars, there having been exported during that month 338 cars, valued at \$439,326, and parts valued at \$83,443, a total of \$522,769, as compared with 106 cars valued at \$165,-837, and parts valued at \$47,938, a total of \$213,775, during the same month last year. During the ten months ending with October there were exported 2,764 cars valued at \$5,921,033, and parts valued at \$701,593, a total of \$6,622,626, as compared with 1,918 cars valued at \$3,971,406, and parts valued at \$525,097, a total of \$4,496,503, during the same period in 1908.

#### Russian Auto Imports and Exports.

The imports of vehicles of all kinds into Russia are increasing from year to year, according to a recent German consular report. The value represented amounted to only 1,800,000 roubles in 1906, but in 1907 it had risen to 3,500,000 roubles, and in 1008 to 5,100,000 roubles. This development is thought to be mainly due to the increasing sale of automobiles. In 1904 and 1905 only about 100,000 roubles' worth of cars were imported each year, but in 1907 the auto imports had already increased to 1,600,000 roubles, and in 1908 they increased further to 3,100,000. Large cars for four or more passengers are most in favor, and of these 2,800,000 roubles' worth were imported in 1908, as against only 300,000 roubles' worth of runabouts. Only slight progress was made by the Russian automobile industry during 1908, and native manufacturers still confine themselves almost entirely to the assembling of parts built in other countries and to the manufacture of bodies. These home products, however, are not in great demand. In the line of pleasure vehicles French products enjoy the preference, while in the field of motor trucks and omnibuses German products are in the lead. The German manufacturers are evidently also endeavoring to increase their exports of pleasure vehicles to Russia, as in the occasional races there have always been a considerable number of German starters. The growing importance of Russia as an automobile market has recently also attracted American firms, who are introducing particularly low priced cars. In St. Petersburg there are at present about 700 cars in use.

#### Fairmount Park Race a Financial Success,

According to the report of the executive committee in charge of the Fairmount Park automobile race, held on October 9, the race resulted in net profits of \$7,617.34, which will be distributed among four Philadelphia charitable institutions. The total receipts handled by the executive committee were \$11,735.41, and the gross expenses amounted to \$4,118.07. The four institutions are the Pennsylvania Society for the Prevention of Tuberculosis, the Children's Aid Society, the Rush Hospital and the White Haven Sanitarium.

#### 1910 Handbook of Gasoline Automobiles Out.

The new edition of the handbook of gasoline automobiles manufactured by the Association of Licensed Automobile Manufacturers has just made its appearance. It is gotten up much the same as in previous years, and contains in addition to the illustrations and specifications of the cars made by licensed manufacturers a list of officers of the association, and extracts from Judge Hough's decision sustaining the Selden patent.

### DESCRIPTIONS OF NEW VEHICLES AND PARTS.

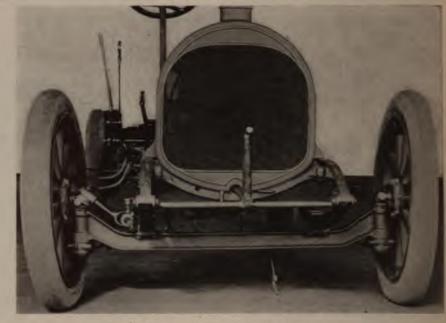

The Royal 1910 Model M.

The Royal Tourist Car Company, of Cleveland, Ohio, for 1910 manufacture a single model, designated Model M, Series II, which is a continuation, with certain alterations, of the Series I built for 1909. Upon this single chassis are mounted various types of bodies, including, besides the standard touring and enclosed models, a close coupled, a semi-racer and a torpedo pattern.

The motor has four cylinders of 5½ inch bore and 6 inch stroke, developing 48.4 horse power, according to A. L. A. M. rating, at 1,000 r. p. m. With the valve setting usually fitted, it gives considerably more at this speed, and varies from 60 to 70 between 1,450 and 1,800 r. p. m.

The cylinders, of distinctive shape, are cast in pairs, and have an inspection cover over each cylinder head. The intake ports are siamesed, but the exhaust passages are individual. The valves are on opposite sides of the motor, taper seated, of 2¾ inches outside diameter, one-half inch stem, are forged solid of nickel steel and work in renewable guides. The intake lift is seven-sixteenth inch, the exhaust three-eighth inch.

The pistons are very light, and carry four one-quarter inch eccentric rings above the wrist pins and one near the bottom to keep oil from working up to the combustion chamber. The connecting rods are drop forged, of H section, and carry a hardened steel bushing 234 inches long, working on a 134 inch hardened wrist pin. The wrist pin fits in taper bearings in the piston, the taper of the two sides being continuous and

ROYAL TOURIST, FRONT VIEW.

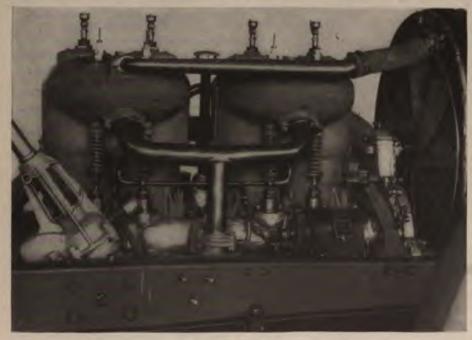

reamed with the same reamer, and is locked by taper pointed set screws, which extend through the walls of the tubular wrist pin.

The crank case, of aluminum, is formed of two halves, with a separate gear cover in front. The upper half carries the crank shaft in three manganese bronze bearing caps, while the lower part serves only as a cover and oil pan. A three point suspension is employed. The motor is supported by two rear arms, carried in semi-spherical sockets, and in front from the centre of a drop forged bridge which spans the frame by a trunnion, which allows a limited mo-

tion to compensate for frame distortion. The crank shaft is drop forged from nickel steel, with a flange for attachment of the flywheel and an extension which carries the clutch. There are three main bearings, the front one 176x334 inches, the centre 2x4½ inches and the rear 2½x3 inches. The connecting rod pins are 1½ inches diameter by 3½ inches long. In addition a ball thrust bearing is fitted to take the thrust when the motor runs with the clutch withdrawn. Parsons white brass bushings are used for all crank bearings. By removal of the oil pan the wear on each bearing can be individually taken up.

The cam shafts are .40 to .50 per cent carbon steel, approximately I inch diameter, and work in long bronze bushings, which are formed with ribs to catch and feed of the front ends are flanged for attachment of the gears, and each shaft, with cams, bearings and gears, is assembled as a unit and introduced into the case from the front. The cam gears have helical teeth, nine normal pitch, and are made of bronze with fibre riveted to the inner web. The crank shaft gear is drop forged, is drawn upon a taper and fastened with a large Woodruff key.

The cams are of 13% inch extreme radis, five-eighth inch face, and fastened to the shafts by Woodruff keys and taper pins. The exhaust cam shaft is offset from the centre line of the valves to allow a quick opening against the explosion pressure without undue side thrust. The cams operate the valves through plungers carrying rollers. These plungers have a sleeve which surrounds roller pin and plunger, and this gives an unusually large amount of bearing

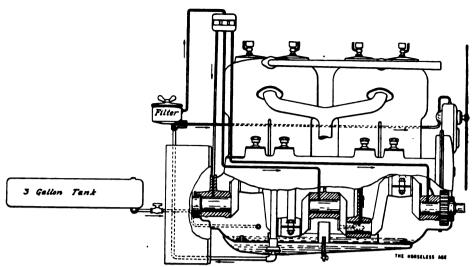

ENGINE INTAKE SIDE.

surface. These plungers are further formed to act as pumps to draw in oil mist from the crank case, and on the up stroke to project it down upon the bearing surface of the roller pin and bronze plunger guide.

The fan is 20 inches diameter, stamped in one piece from No. 16 gauge aluminum, and is driven through an idler from the intake cam shaft gear at one and two-third times engine speed. Both idler and fan gear run on imported annular ball bearings, and in addition a ball thrust bearing opposes the propelling action of the fan. A small adjustable single disc clutch construction saves the gear from excessive inertia stresses.

A large centrifugal water pump, assembled and attached as a unit, is located on the exhaust side of the motor at about the centre, and is driven by gears from the exhaust cam shaft at twice engine speed. The water is forced into the cylinder opposite the exhaust valve seats, and taken out above the intake valve seats, the flow around the cylinder barrels being mainly due to thermal variations in density. The square tube radiator is of circular shape. which is the distinguishing mark of the Royal Tourist. It stands on leather pads on the front channel cross member of the frame, to which it is attached by two studs, and is also supported from the dash, from which it is braced by a one-half inch rod inside the centre hood hinge. An oval filler is fitted.

The oil circulation system is not unusual, except in the incorporation of a real filter in the line from pump to motor bearings. As shown by the diagram, the oil in which the connecting rods dip is held at a constant level, the excess overflowing to a chamber beneath, from which a gear pump forces it through the filter, thence through sight feeds on the dash to the main crank shaft bearings. A check valve on the filter keeps a constant pressure and allows a bypass stream, which continuously floods the time gears and their bearings. As the oil fed to the main bearings escapes at the ends, it is caught by oil catchers attached to the crank webs and impelled by centrifu-

ROYAL ENGINE, SHOWING SYSTEM OF LUBRICATION.

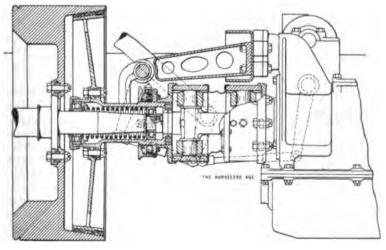

gal action to both upper and lower connecting rod bearings. All bearings in the crank case are arranged to collect the splash and to run safely on this alone in event of the exhaustion of the extra oil supply. To prevent any such occurrence a 3 gallon tank is carried beneath the footboard at such a level that turning a cock will allow it to flow into the crank case. To prevent waste felt washers and packing nuts are provided at all points where a rotating shaft projects from its casing.

The dual ignition system comprises a Bosch D-4 magneto with single non-vibrator coil and storage batteries. Instead of the usual method of magneto timing, the low tension breaker is locked at the point where the maximum potential is developed, and the time of spark in relation to the motor is regulated by sliding a shaft with spiral teeth through the gear which drives the magneto. This allows a full hot spark when the motor is running with the spark retarded or under low throttle. An encased Oldham coupling takes care of any maladjustment in case of a replacement of a repair. A small flywheel on the magneto spindle decreases the strains on the gears; also their noise. The machine is mounted in a most accessible position, and can be

removed in a minute by loosening the straps which hold it down.

The carburetor of this engine is the development of many months' experimental research. It is very simple, consisting of an L shaped air passage water jacketed, a butterfly throttle, a float chamber and spray nozzle, with a by-pass from the lowest part of the L through the water jacket past the throttle to take up the liquid gasoline when running slow. The lower part of the air passage is formed in accordance with the principles which underlie the action of the well known Venturi tube, but its efficiency is said to be such that, with a given flow of air, the fall of pressure at the nozzle is about twice that of the Venturi tube shapes in common use. This gives vaporization at a lower speed, and better vaporization at a higher speed, and it further decreases the relative effect of the conditions which retard the flow of gasoline (under a small head) to such an extent that the proportion of gasoline and air is substantially constant for all demands of the engine. A small slot, which at its widest admits about 9 per cent. of the total air supply, is regulated by a button on the dash, and forms the only means of adjustment provided.

The flywheel is cast from gray iron, is 17 inches in diameter, weighs 144 pounds and is attached to the crank shaft flange by eight nickel steel bolts and four annular dowels. The cone clutch, used continuously by this company since 1904, is continued, with the addition of cork inserts. The cone is 1534 inches in diameter, 8° taper on each side, and is faced with leather 21/4 inches wide. Small flat springs of greater radius than the cone are attached by their centres around the outer edge under the leather. and raise it slightly to give gradual engagement. This clutch cone is attached by nickel steel bolts and annular dowels to the drop forged clutch sleeve, which slides and rotates on ball bearings supported by a 1 to inch diameter extension of the crank shaft, and is thus centred accurately and rigidly. The connection between clutch sleeve and transmission is by a short shaft with square trunnion blocks at each end, working in-

ROYAL CLUTCH AND UNIVERSAL JOINT.

divided on a horizontal plane through the

side of drop forged flanges. By removing these flanges and one retaining screw the clutch may be removed entire. Throughout the transmission line on this car, from crank shaft to rear axle, the power is passed through flanges bolted with nickel steel bolts and circular dowels, or through large, hardened blocks working at a considerable radius. And while all joints are enclosed and packed in grease, means are in every case provided for forcing lubricant directly to the bearing surfaces.

The transmission gives four forward speeds and reverse, the ratios being, respectively, 1, .74, .45, .22, .16. Chromenickel alloy steels are used, high carbon for the shafts and low for the gears. The annular bearings used are of large size, and all of well known German makes. On the countershaft the gears are bolted to flanges or fastened on a ground taper with nickel steel keys. The main shaft, on which the gears slide, is of 13% inch outside diameter, and is formed with six integral keys. The countershaft is below the main shaft, suspended from the upper half of the crank case by manganese bronze caps and nickel steel bolts. An oil pan without openings covers shaft, caps and all, allowing a great depth of oil to be carried without leakage. Stuffing boxes are provided at the two upper bearings, through which oil might escape. The case has two arms at the rear, which bolt to a cross member of the frame. and in front hangs from another cross member by a cylindrical trunnion, whose axis is parallel with the propeller shaft. The arrangement is such that without removing the body from the car the case can be completely disassembled in place or dropped down entire.

The propeller shaft, of 1½ inch diameter, is forged from 3½ per cent. nickel steel, with a universal joint member integral at each end. A carbon joint is used in front, a block and trunnion in the rear. Both are large and carry means for constant lubrication.

The rear axle, of the full floating type, is formed by bolting two flanged nickel steel tubes to a central cast steel casing, and is

centre line. The upper half is readily removable, and permits easy inspection or complete disassemblage without taking the axle from the car. The bevel pinion, of chrome-nickel steel, formed integral with its shaft, is supported by Timken roller bearings at each end, as well as a ball thrust of good size. The standard touring car gears are four pitch, of seventeen and forty-six teeth, respectively, which ratio gives 39 miles per hour at 1,000 revolutions of the motor. The differential is made up of bevel gears, has four pinions of 5 per cent. nickel steel, and differs from prevailing designs in the manner in which these pinions are located. By making the outer bearing seats for all the pinions part of one continuous spherical surface, they are all machined simultaneously in a lathe fitted with a rotating tool post, and thus are finished much more easily and accurately than if each bearing were milled or back counterbored. The differential case halves, drop forgings, are carried by big annular ball bearings, with ball bearings of the common type for gear thrust. The driving axles are 15% inches in diameter, of chromenickel steel; they receive the drive from the differential gears through integral keys, and deliver it to the wheel hubs by toothed flanges formed in one piece with the shaft. The hubs are drop forged from carbon steel and specially heat treated. The stamped steel brake drums are of 16 inches inside diameter, 4th inches deep, and form the hub flange. The fourteen 134 inch spokes are dished t degree from hub to felloe, and in addition to the wheel bolts are held by slips which pass around them near the outside of the brake drum. The hand brake and foot brake are located side by side in each wheel, and have rolled manganese bronze shoes 13/4 inches wide, giving a total braking surface of 182 square inches. The cam expanding these brakes is mounted with a certain freedom endwise, so that if either front or rear segment should seize first, due to the motion of the wheel, the whole expanding effort can act on the segment not yet tight. To equalize the brake

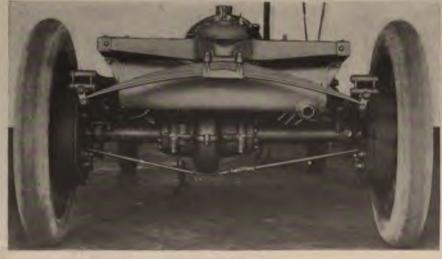

application on each wheel the brake cross rods in the frame each carry a small differential similar in type to that in the rear axle, with but one pinion, and with teeth cast to shape, contained complete in a greasetight case.

The brake adjustment is unusual, and rather more difficult to describe than to operate. The brake segments are an-

rather more difficult to describe than to operate. The brake segments are inchored on bolts that are free to move in slots of constant radius in the anchor plate casting, which bolts are held by the claming action of corrugated face washers when their nuts are tightened up. The bolts for each pair of segments are connected by a right and left screw, to be rotated by a small worm which can be turned with a screw driver, reaching through a hole in the outer face of the brake drum. To adjust, the rear axle is jacked up, the clamping nuts are loosened, and the brake lever is set in the position desired when the brakes should be tight. The small worm is then turned right handedly with a screen driver until the wheels lock; then the bolts are clamped in the new position.

The driving and braking reactions are elaborately provided for in a construction originated and patented by the Royal Tourist Car Company. In this a torque rod attached to the rear axle case restrains the pinion from rotating around the gear, while strut rods attached to the brake hangers. which are free on the axle tubes, take all braking strains and also transmit the drive from the rear wheels to the chassis. The torque rod is a nickel steel stamping of lattice form, while the strut rods are drop forged with I section. Both these pivot on a vertical axis at the axle, to allow slight lateral motion, and both have ball joints at the forward end, the torque rod ball being enclosed in a spring buffer. All joints have large hardened surfaces, with provision for lubrication, and, it will be noted, are so designed that the axle may rise on one side and fall on the other without generating clamping or twisting strains. This construction saves the axle from all torsional stresses, allows the rear springs complete freedom of motion, and gives a flexibility on rough roads which fully justifies its extra

The front axle is what may be termed an inverted Lemoine type, was first built by this company in 1906, and is adopted as given ing a low frame, large spring clearance and simple strong shapes for axle forgings. The axle bed is forged entire from medium carbon open hearth steel, is I section, 3 inches deep by 2 to inches width of flanges; flanges and web three-eighths of an inch thick. A sample forging under test required 19,000 pounds, applied at the spring seats, to produce permanent set. The knuckles, in shape like an inverted L, are forged from nicks steel, and turn in the axle on an anti-friction bearing of three-sixteenths of an inch tool steel rollers. The direct weight on the knuckles is taken by ball thrust bearings with three-eighths of an inch balls. The hubs, worked out of drop forgings, are car-

REAR VIEW.

ried on Timken roller bearings. An eight pitch gear is cut integral on the right hand hub flange to drive the speedometer gear. The knuckle and hub are formed to receive an aluminum housing which completely protects these gears from dust and flying stones. All levers and connections which control the direction of the car are nickel steel forgings of somewhat greater proportions than ordinary, and are specially heat treated and tested to insure against failure from any cause. All joints bear grease cups, with holes leading direct to the working parts, and are equipped with leather boots as a protection from water and dirt.

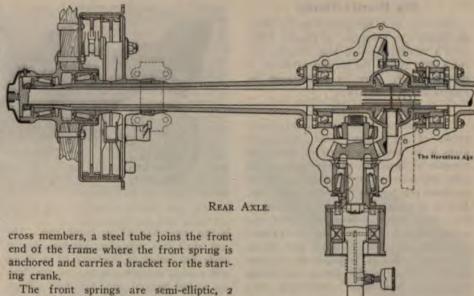

The reach rod ball joints differ from the common style in having the lever fork over the rod, with a nickel steel bolt passing through the lever, rod and ball, so that no amount of wear on the ball sockets will permit the rod to disconnect. These balls have large surface, being 11/4 inches in diameter, and work under the cushioning effect of springs contained in the rear end of the reach rod. The steering cross rod is behind the axle, and being in compression is 11/4 inches in diameter, three-sixteenths of an inch wall, heat treated, steel tubing, and is made adjustable for length.

The steering control is effected by a worm and sector, the sector being used in preference to a full gear on account of the greater radius that the same space will allow. The sector is bolted with annular dowels around the nickel steel bolt to a semi-flange forged integral on the sector shaft, which forging extends down as the lever arm.

Ball thrust bearings are used and nonadjustable plain bearings of hard bronze, each with an individual grease cup lead.

The steering wheel is of Circassian walnut, 181/2 inches in diameter, and totally encloses the rim of the aluminum steering spider, which is attached to a flange on the steering column by six bolts. The throttle and spark levers are in the centre of the wheel, and instead of the common metal ratchet are held by an arrangement similar to a single disc clutch. The levers are steel stampings, and have as their centre a disc 21/8 inches in diameter, around the exterior of which are a number of fibre plugs oneeighth inch in diameter and about threesixteenth inch thick. The throttle lever sits at the bottom of a small brass casting, next a metal plate or washer; on top of this the spark lever, and another plate; then a star shaped flat spring, which is compressed by the cover and furnishes the frictional force.

The frame is stamped from three-sixteenth inch nickel steed, heat treated, and is of 51/2 inches greatest depth, has 2 inch flanges, which gradually increase to about 334 inches at the flywheel and is raised 31/2 inches in the rear to give room requisite for comfortable spring action. The rear cross member is expanded out at the centre in a distinctive shape, to carry the rear cross spring underneath, and receives inside diagonal braces leading to either side of the frame. Besides three other channel

inches wide by 40 inches long, with six leaves. The rear side springs have shackles

at each end, are 21/4 inches wide, 50 inches long, with seven leaves, while the cross spring is 381/2 inches in length, same width and number of leaves. Care has been taken in the design to secure extreme axle clearance, and this with rubber buffers to protect against unusual shocks allows the use of springs of exceptional flexibility. The spring clips used are of a type originated by this company. A single box shaped forging having four legs and bearing on the sides as well as on the top is used for each spring. The rigidity of this form is further increased by making it of nickel steel. Bronze pads are carefully fitted above and below each spring at the clip to insure the positive bearing on the clamps, which prevents breakage. The spring shackle bolts are fastened so that they rotate in the spring eyes instead of the shackles, and either have grease cups on the heads or are provided with leads for a grease gun nozzle. The spring clip nuts, brake adjustment pins, and all such parts which might rust tight, are sherardized, a process similar to galvanizing but penetrating somewhat deeper.

An aluminum under pan extends from the radiator to well back of the transmission, and is divided longitudinally in three parts, the two sides being bolted to the frame, while the centre may be lowered by unbuckling three leather straps. The fenders are flat across their tops, but are very similar in outline to the ones used this present season. An aluminum pan across the frame reaching from the radiator to the very front crossbar completes a protection from mud and dirt which extends from front to rear. A flat wooden dash of Circassian walnut, almost severe in its outlines, replaces the curved dash which has helped to identify the Royals of the past five years, and carries simply a cylindrical, non-vibrator coil, a small three lead oil gauge, and a button controlling the carburetor adjustment. A muffler cut-out, opened by a pedal button, and an accelerator pedal are fitted.

All the pedals work through holes, not slots, in the footboards, and as these latter are covered with aluminum matting, also used on the running board, this part of the car is always neat and clean.

The gasoline tank holds 30 gallons, is located under the front seat, and is filled through a spout in the front seat division. In the upper part of the front is a reserve supply, which is turned on or off by a valve behind the driver's foot. The way of filling the reserve supply tank is very simple, yet insures a filled tank at all times to fall back on. A small spout leading to the reserve tank is located inside the main filling spout and some 4 inches below the top, and in such a position that it is impossible for the gasoline to flow past into the main tank without a portion of it flowing into the reserve. A two-way cock makes it impossible to draw from the main tank and the reserve at the same time, and thus depleting both supplies.

### Stafford Motor Car Company to Move from Topeka to Kansas

City.
The Stafford Motor Car Company has been organized at Kansas City, Mo., with a capital stock of \$100,000, and will begin operations in the building of the Bower Machine Works, at Eighteenth and Wyandotte streets, about January 15. The organizer of the new company is Perry Stafford, who was formerly superintendent of the Smith Automobile Company's plant in Topeka, Kan., and more recently manager of the Stafford Motor Car Company of the same city. The new company has taken over all the machinery and designs of the Stafford Motor Car Company of Topeka, and the assets will be moved from Topeka to Kansas City some time during January. The company will build the same car that Mr. Stafford has been building at Topeka for the past two years. A number of Kansas City capitalists have joined Mr. Stafford

#### The Everitt Thirty.

This new car is the product of the Metzger Motor Car Company, of Detroit, Mich. It is a moderate priced four cylinder machine, and shows the careful attention to details usually given by experienced designers and manufacturers.

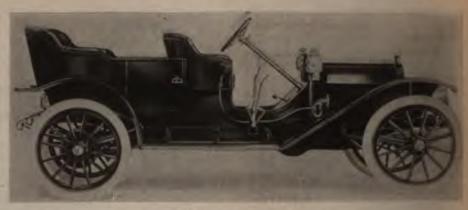

#### THE MOTOR.

The motor has a bore of 4 inches and a stroke of 434 inches. This long stroke gives it an unusually powerful torque for a motor of its rating, 30 horse power. All four cylinders are cast together, as is now accepted practice for motors of this size. But in this instance the block casting is even more comprehensive than usual, and comprises both the inlet and the exhaust manifolds and also the upper half of the crank case. Recent developments in foundry work and in the repair of castings have made this rather complicated block casting practical.

The valves are in pockets all on one side, operated from a single cam shaft. The pockets are closed by screw plugs. The exhaust manifold is above and the inlet below. Connection to the carburetor is made by a flanged pipe which passes between the second and third cylinders. There is ample water space between all adjacent cylinders and all around the valve seats. The top of the jacket is covered by a gray iron plate which has the water outlet pipe cast integral.

A further extension of this cover toward the front carries the fan. This fan bracket is made in the form of a clamp which grips a vertical rod that is forged integral with the spindle on which the fan turns. By sliding this rod up or down the tension of the fan belt may be adjusted. The radiator is of the vertical tube type. The radiator proper is contained in a stamped sheet steel casing which may be removed should repairs become necessary. This casing is enameled royal blue. The water circulating pump is of the centrifugal type, gear driven.

The valves are operated in the standard manner by push rods leading through bosses

THE EVERITT "THIRTY."

in the upper half of the crank case. The cam shaft has only two bearings, but is made 11/4 inches in diameter so as to be stiff enough to work quietly. All the cams are forged integral with the shaft. These large diameter cams give quiet valve operation.

The crank shaft is of the three bearing type, and is bushed with nickel babbitt. The bearings are suspended directly from the cylinder crank case unit, and their caps are entirely separate from the bottom portion of the crank case, which is merely an oil reservoir. This oil chamber is of cast aluminum.

Lubrication is by the splash system. The oil level is maintained at a constant height in the crank case by a supply from a sheet metal tank which is located close to the water jacket of the two middle cylinders. Oil flows from this tank by gravity, and the rate of flow is automatically regulated by the rising level of the oil, which closes the only opening to this air tight oil tank when it reaches the required height.

Ignition is by jump spark, the plugs being located in the caps above the valves. Current is supplied from two sources, viz., battery and magneto. The wires are neatly secured in insulating tubing. The coil box is fastened to the front side of the three ply mahogany dash.

THE CLUTCH.

The inside of the rim of the 16 inch

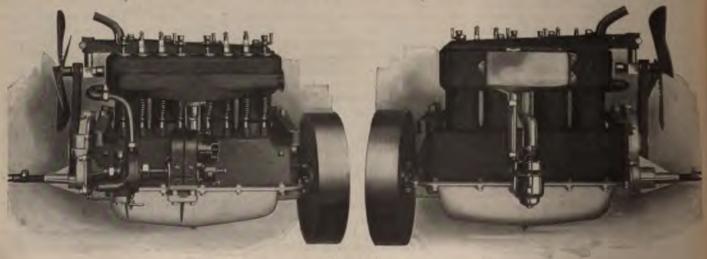

flywheel is turned conical to fit the male member of the clutch. This latter is of aluminum, faced with chrome tanned leather, two inches wide. Under this leather are a number of plungers which are pressed against it by springs, to give gradual engagement. Clutch engagement is secured by a 200 pound spring. The pedal leverage is so arranged that only as pounds foot pressure is required to release the clutch.

#### TRANSMISSION.

The change gear is on the rear and. It is a standard sliding gear, giving three speeds and a reverse. From the front of its case a tube leads forward to about the middle of the car. To the forward end of this tube is secured a strong fork. This fork is free to turn on the tube, but cannot slide endwise. It is hinged to the frame and transmits both driving and braking strains. This torsion tube contains the propeller shaft, which has a single universal joint, centering with the fork movement. A short shaft with another universal joint at its forward end connects with the clamb

AXLES AND SPRINGS.

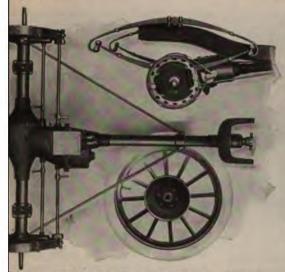

The rear axle casing is made up from steel tubes and cast steel gear houses fastened together by pressing and riveling. It has a truss underneath and the propellar shaft housing tube is connected to the axis tubes by diagonal struts. The bevel driving gears have a standard ratio of 3½ to 1.

MAGNETO SIDE.

EVERITT ENGINE,

CARBURETOR SIDE

TRANSMISSION AXLE, REAR WHEEL AND SPRING.

front axle is an I section forging, of the Elliott type, with a slight drop en the springs. The springs are seto the axle by large clips with wide all portions.

front springs are of the semi-ellipttern, 34 inches in length, with seven There is sufficient space between and frame to permit a 4 inch den. The rear springs are of the full c pattern, with full scroll shackled They are 36 inches long and have ach opening. At the bottom they are ed to seats which surround the axle have collars at each side to prevent se movement. Above they are fastto brackets riveted to the frame. frame is of pressed steel. It has a e drop which brings the centre of y of the loaded car low and at the time maintains ample road clearance. ear drop is 51/2 inches and the front is 3 inches. The channel is 13/4x4 The width is 30 inches. The motor ried on two drop forged I section pars: The road clearance is 111/2

#### STEERING AND CONTROL

esteering is on the right hand side, the eing set at a rakish angle. The wheel inches in diameter, and has the spark hrottle levers placed below it con-

to the operator's left hand, ear is of the worm and secpe, and is cross connected to ght knuckle. The cross conn between the knuckles and her parts of the mechanism aced high enough and to the of the axle so they are profrom accidental injury.

r shifting is by a sliding lever working in an H plate. haft for this hand lever carwo jaw clutches, which enwith levers mounted on a ton the central cross memthe frame. These are condirectly with the gear shifteds on the rear axle. The grods are furnished with

spring pressed plungers, which fit in notches in the rods and lock the gears in engagement. There is also a ball interlock between the rods, which prevents more than one being shifted at a time.

Both sets of brakes act directly on the rear wheels. The expanding brakes have metal to metal contact. The contracting brakes are faced with asbestos fabric. All the brake rods are brought inside the frame, and all the pulls come straight along the rods, so there is no chance for binding.

The wheels are of the wood artillery type. The

rear have twelve spokes and the front ten. They are equipped with 3½x34 inch tires. The tread is 56 inches, and the wheel base is 110 inches. The front wheels have plain ball bearings, the rear axle has Hyatt and Timken roller bearings.

#### BODIES.

The five passenger touring body is unusually large, with generous doors and ample foot room in the tonneau. The inside width of the tonneau seat is 52 inches. The usual styles of runabout and small tonneau bodies are also furnished. Mud guards and running boards are of pressed steel, and there are pressed steel shields between the running board and frame sides. The height of the door sill from the ground is about 28 inches under load.

Great care has been taken to insure reliable lubrication of small parts, grease and oil cups being liberally supplied. Magneto, generator, horn and a full equipment of gas and oil lamps are included in the regular price of the car.

#### Milwaukee Automatic Spring Bumper.

The Garage Equipment Manufacturing Company, of Milwaukee, Wis., have placed on the market an automobile bumper which they term "automatic," since it is unnecessary to drill holes in the frame or to change the spring shackle bolts in order to attach this bumper to the car. The bar itself is of steel and covered with a seamless brass tube. The arms which hold this bumper cushion on brackets which are clamped to the front portion of the frame. In other words the thrust of any shock is

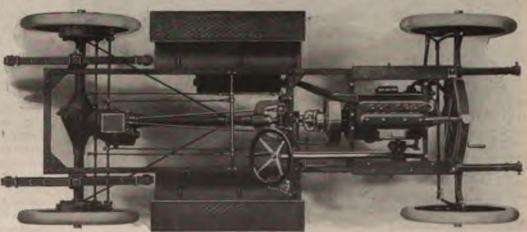

MILWAUKEE AUTOMATIC SPRING BUMPER.

on the end of the frame, and not on the spring hanger bolt. This bracket is clamped above the spring shackle end, and back of and below the frame. It is so arranged that it can be elevated or lowered to any desired position.

#### New Firestone Tire Plant.

Plans are being prepared for an entirely new plant to be erected by the Firestone Rubber and Tire Company, of Akron, Ohio. The company has recently acquired a large site beyond the railroad tracks on South Main street, where the plant will be erected. When the new buildings are completed the company will employ 3,000 men. L. E. Sisler, of Detroit, treasurer of the company, made the important announcement at Akron recently. The capacity of the plant will be trebled. At present the concern, which is one of the largest tire plants in the country, employs 1,400 people. Officers of the company are: H. S. Firestone, president and general manager; William Christy, vice president; S. G. Carkuff, secretary, and L. E. Sisler, treasurer.

EVERITT THIRTY, PLAN OF CHASSIS,

#### Franklin 1910 Models.

The H. H. Franklin Manufacturing Company for the season of 1910 will again produce three different types of chassis, with sixteen different styles of bodies. Two of the chasses are equipped with four cylinder motors and one with a six cylinder motor. The smallest chassis is the Model G, which has a four cylinder, 18 horse power motor of 33% inch bore by 4 inch stroke. Model D has a four cylinder, 28 horse power motor of 41/4 inch bore by 4 inch stroke, and Model H has a six cylinder, 42 horse power motor of 41/4 inch bore by 4 inch stroke. All of the motors are air cooled and comprise the several distinctive features introduced by the Franklin Company in recent years, such as concentric valves in the cylinder heads and auxiliary exhaust ports.

The most important innovation in design in this year's models relates to the method of cylinder cooling. The cylinders are now cast with vertical sheet steel flanges approximately I inch high, which are surrounded by a sheet iron cylinder or air jacket. The jackets are open at the top, and at the bottom are joined to a sheet metal division plate extending all across the engine space from one side frame to the other, and from the front cross member of the frame to the dashboard. Underneath the engine is placed the usual sod pan, which at its rear end is shaped so as to fit closely around the flywheel. The latter, which is 20 inches in diameter on Models H and D, forms a sirocco fan and draws air through the air jackets around the cylinders. By this method of air circulation the cooling effect is equal for all cylinders and all around each cylinder. It has been found that when the car is being driven on the road there is always a slight excess pressure of air in the hood above the division plate, this being shown by the fact that the hood is lifted by

FRANKLIN 1910 FOUR PASSENGER, 18 H. P. TOURING CAR.

the air pressure unless it is fastened down. The front fan has been entirely done away with, which makes the engine slightly more accessible, besides doing away with the separate fan drive. The bonnet opening in front is covered by grill work, the same as in former years, through which the air enters. One feature of this cooling system is said to be that the engine and the accessories in the bonnet space remain almost absolutely free from road dust.

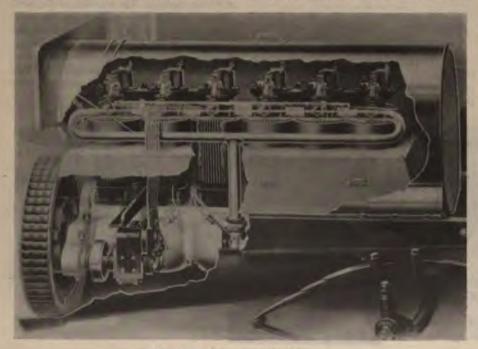

Aside from the change in the cooling system the engine remains practically the same as in previous years, the concentric valves and auxiliary exhausts, its most characteristic features, being retained. The crank shaft is supported by bearings between each pair of throws, which bearings are lined with die cast babbitt bushings. The crank chamber is of the barrel type, with end plates or cheek pieces containing the end bearings. All screws and nuts inside the crank chamber are made of nickel steel, and are positively locked in place.

The carburetor has not been changed, except that it is now primed from in front of the car instead of from the dash. It has both a hot air inlet and a cold air inlet, the former being closed in summer time by means of a butterfly valve. The hot air is drawn in through a jacket around a portion of the exhaust manifold. At the bottom of the carburetor there is a combined gasoline strainer and water separator.

Ignition is effected by means of a Bounhigh tension magneto, which is located to the right hand side of the motor toward the rear, in a very protected position. The spark lever has this year been done away with on all models, but on two of the models a centrifugal governor is provided, which automatically retards the spark when the speed of the vehicle drops below 12 miles per hour. Above that speed the spark point is fixed. The magneto is the only source of ignition current, this arrangemen having proven entirely satisfactory during the past year.

The engines are lubricated by means of a mechanical oiler which is gear driven from the cam shaft. This oiler on the six cylinder model has six leads. No. 1 lead goes to the forward bearing of the engine and then drains into No. I pocket of the crark case. Lead No. 2 goes to No. 1 crank case pocket; lead No. 3 to No. 2 crank case pocket; lead No. 4 to No. 4 crank case pocket, skipping pocket No. 2; lead No. 5 goes to crank case pocket No. 5, and lead No. 6 to the rear engine bearing and from there drains to No. 6 pocket. In addition to the mechanical oiler a plunger pure oiler is provided on the dash of the or It draws its supply of oil from the tank of the mechanical oiler and forces it to the forward crank case compartment. This our is used when long, steep hills have to ke climbed, when the oil in the crank see drains toward the rear and the forward cylinder has a tendency to run dry. The oilers on Models D and G have a capacity of 3 quarts, and that on Model H has a capacity of 1 gallon.

The gasoline tank is made of sheet copper and placed in the front seat. An auxiliary tank is provided which gives a warning to the driver when the fuel supply is neuring exhaustion. The auxiliary tanks have a capacity of 2 gallons on all except the runabout models, on which they are of 1% gallons capacity. The main tanks have

CUTAWAY VIEW OF 1910 ENGINE.

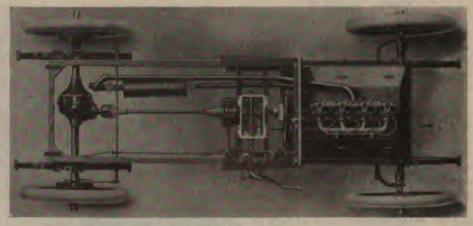

the following capacities: Model H, 17 gallons; Model H runabout, 13 gallons; Model H limousine, 15¾ gallons; Model D, 12¾ gallons; Model D runabout, 13 gallons; Model D landaulet and limousine, 15¾ gallons; Model G, 12¾ gallons, Model G runabout, 13 gallons.

The former type of multiple disc clutch is retained on this year's models. A selective three speed transmission of the company's own make is now used on all models. All of the pinions and gears are made of 3½ per cent. nickel steel and are worked out of solid stock. The gears have only five-eighths of an inch width of face and the gear-box is unsually compact.

The drive on all Franklin cars is by shaft and bevel gears. The gear ratios for the different models are as follows: Model H, 3½; Model D, 35-7; Model G touring car, 41-6; Model G runabout, 35-7. The axles on Models D and G are of the semi-floating type and that of Model H is a regular live axle. The propeller shaft and rear axle shafts are of 3½ per cent. nickel steel.

In the construction of the axles on the 28 and 42 horse power models no brazing is done, the parts being first pressed together and then cold riveted, which makes a positive joint. Timken roller bearings are used on the front axle and Hess-Bright annular ball bearings on the rear axle. The front axles on the 28 and 42 horse power models consist of 21/2 inch nickel steel tubes with yoke type steering heads. The steering knuckle arms are forged separate from the knuckles and are fitted to the latter with a taper and key and drawn up with a nickel steel castle nut. The Franklin Company this year uses its own design of worm steering gear on all models. The steering hand wheels are 17 inches in diameter. There is only one finger lever on top of the steering wheel, that for the throttle.

The frame is made of laminated white

PLAN VIEW OF CHASSIS.

ash sills, as has been the Franklin practice for many years. Full elliptic springs are used all around, secured underneath the axles, those on Model G being 36 inches in length and those on Models D and H 40 inches. The wheel base is 127 inches on Model H, 106 inches on Model D, 1111/4 inches on Model D landaulet and limousine, and 911/2 inches on Model G. A rather noteworthy feature of this year's Franklin line is the large tires fitted to the different models. The sizes are given in the following table:

Model H, 36 inches by 41/2 inches front. Model H, 37 inches by 51/2 inches rear.

Model H Limousine, 34 inches by 41/2 inches front.

Model H Limousine, 35 inches by 5 inches rear.

Model D Limousine, 36 inches by 4 inches front.

Model D Limousine, 36 inches by 41/2 inches rear.

Model D Landaulet and Limousine, 34 inches by 43/2 inches front.

Model D Landaulet and Limousine, 35 inches by 5 inches rear.

Model G Landaulet and Limousine, 32 inches by 31/2 inches front.

Model G Landaulet and Limousine, 32 inches by 4 inches rear.

Quick detachable tires are fitted exclusively, and no provisions are made on any of the models for carrying spare tires, as it is claimed that the unusually large size of the tires, combined with the light weight of the car, makes this unnecessary.

All of the cars are fitted with double acting Raymond emergency brakes on the rear wheel hubs, which are operated by a brake lever at the side of the driver's seat. These brakes are 16 inches in diameter and have 2½ inch faces. A double acting Raymond service brake is fitted to the transmission drive shaft and is operated by a pedal. The latter brake is of small diameter but large width—4 inches. Neither of the brakes is interconnected with the clutch.

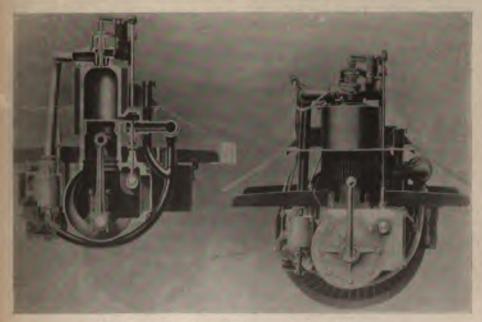

The Franklin bodies are made of sheet aluminum riveted to continuous steel angle frames. All bodies are ironed for tops. Models H and D are provided with luggage carriers. The equipment includes two oil side lamps, one rear lamp, two headlights, Prest-O-Lite tank, horn, complete tool equipment, jack and automobile cover.

#### "Silent Sioux" to Be Manufactured in Waukesha.

The Silent Sioux Automobile Company has recently occupied the factory formerly used by the Waukesha Motor Company, Waukesha, Wis. R. J. Wells, an attorney of Sioux Falls, S. Dak., is president of the company and T. L. Fenwick general manager. The car to be manufactured, which is to be known as the "Silent Sioux," is a five passenger touring car, rated at 40 horse power, and is to sell at \$3,000. It has been built at Sioux Falls, S. Dak., for some time. The Waukesha motor is being used.

#### Moyer Factory to Open First of the Year.

Harvey A. Moyer, a prominent carriage manufacturer of Syracuse, N. Y., whose intention to enter the automobile manufacturing business was first announced in The Horseless Age in August last, will open his new plant, specially erected for the purpose at an expense of \$50,000, on January 1 next, and expects to turn out 200 cars next year.

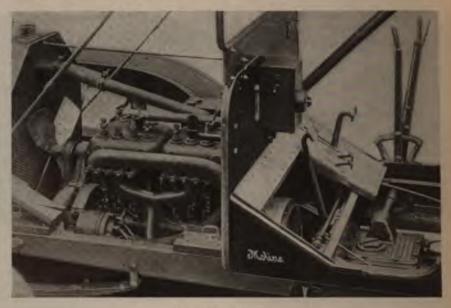

CROSS SECTION OF ENGINE SHOWING AUXILIARY EXHAUST.

#### Moline Model M.

The Moline Automobile Company, East Moline, Ill., have recently made announcement of their new 1910 Model M, which sells at \$1,500. Some minor changes have been made, but the car remains in general the same as last year.

The motor is a four cylinder, four cycle, water cooled one, with the cylinders cast in pairs, with valves all on one side. The water jackets are very spacious, and entirely surround the whole upper portion of the cylinder, with the water outlet located midway between the cylinders in each pair, where the water would be the hottest. The thermo-siphon cooling system is employed, and the water connections are of very liberal size, as required by this method of circulation.

The cylinders are of 4 inch bore and 4½ inch piston travel. The piston is long and provided with three compression rings above the hollow piston pin. The piston pin bearing is of phosphor bronze. The valves are mushroom type, and actuated through roller lifters in bronze guides by the cams. The valves have 45 degree seats and are 35 per cent. nickel steel. The

FRONT OF CHASSIS.

one in front, the latter on the cross member on which the fan bracket is carried.

The crank case is in two pieces, the upper portion containing the crank shaft bear-

Model M, 30 H. P., Four Cylinder Moline.

cylinders, pistons, piston pins, valve seats, cam shaft and crank shaft are all finished by grinding.

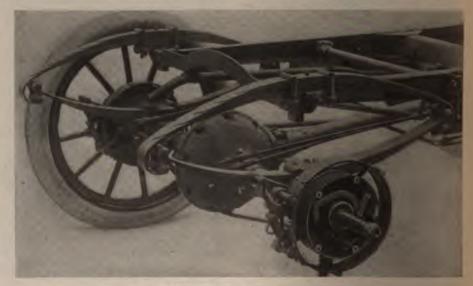

The connecting rod is drop forged, and is fitted with a phosphor bronze bearing at the top and nickel babbitt bearings at the bottom. The crank shart is also drop forged and heat treated; it has three liberal main bearings, which run in nickel babbitt bearings.

The cam shaft and magneto gearing is enclosed in an oiltight compartment. The exhaust and inlet manifolds, which are located on the left hand side of the motor, are held in position by two clamps and four studs, making either readily removed. The placing of the exhaust, inlet and magneto all on one side leaves the whole other side for the force feed oiler, which supplies the several main bearings of the crank shaft, as well as the connecting rod dip pockets, with lubricant. The flat belt driven fan is carried on an adjustable eccentric bracket on the front cross member of the frame.

The motor, clutch and transmission are all contained in a single unit with three point suspension, two points at the rear and ings and inspection plates, through which the connecting rod and crank shaft bearings may be examined. To the rear end of the crank case is attached a yoke member,

which embraces the flywheel and rigidly connects the change gear case with the crank case. The clutch is a standard leather faced cone with cork inserts, all working parts of which are fully housed and protected. It is so designed that it can be removed from the chassis upon the removal of the floor boards without disturbing any other part of the car. It transmits to a three speed gear of sliding type, in which the changes of gearing are secured selectively by a side lever. All gears are of nickel alloy, in an aluminum case, with both shafts carried on Timken bearings. A large hand hole is provided in the cover of the gear case for inserting lubricant, or for inspection.

The drive to the rear axle is through an enclosed propeller shaft, with a single universal joint. The centre of the cross of the joint lies in the plane of the torque tube yoke above mentioned, thereby protecting the joint from torque strains. The propeller shaft runs on New Departure ball bearings, and all shafts in the rear axle

MOLINE REAR CONSTRUCTION.

construction are carried on roller bearings, with ball thrust bearings to take up the end

The front axle is drop forged, heat treated, of I section. The steering knuckles are carried on heavy pivots with bronze bushings.

The front springs are semi-elliptic, 42 inches long, and the rear springs full scroll elliptic. In order to prevent side sway due to the use of these the axle tubes are guyed from each outer end by tubes to the casing containing the universal joint. The frame is of pressed nickel steel and fitted with radius rods, which take all the driving strains, thus relieving the springs of this load.

Spark and throttle control levers are located on a stationary quadrant above the steering wheel The gear shifting lever is arranged so that from the neutral position it can be thrown in high or second without shifting lever sideways. Low speed is obtained by the usual method of shifting the lever sidewise. The emergency brake lever applies the brakes and disengages the clutch at the same time. The steering gear is a worm and sector. Brakes are external contracting and internal expanding, operated by the usual method and acting on rear wheel brake drums.

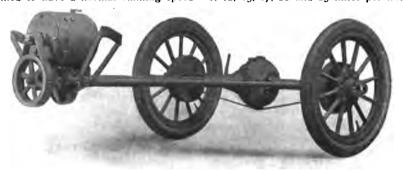

Sixteen gallons of gasoline is carried in the tank under the front seat, and is supplied to the carburetor by gravity. A Splitdorf magneto is used in connection with batteries, with a single coil on the dash. Provision is also made for a timer, if it is desired.

Every car comes equipped with two gas headlights, with generator, two side oil lamps, one oil tail lamp, horn, robe rail, and full tool equipment. One special feature of these cars is that the tonneaus are all detachable. The chassis can be had with baby tonneau, touring car, single rumble roadster or a beetle back roadster body, all models having 110 inch wheel base.

#### The Ohio Electric Model D.

The Ohio Electric Car Company, who recently began the manufacture of shaft driven electric pleasure vehicles in the Milburn wagon plant in Toledo, Ohio, have just bought out an electrically driven coupé known as Model D. This car has a combination wood and steel frame, the object being to secure stiffness and thus reduce the strains on the closed body to a minimum. The makers are prepared, however, to furnish a regular pressed steel frame to any who may prefer it. The car is claimed to have a normal running speed

eral Electric motor of unusually large size. with aluminum heads and Hess-Bright ball bearings, is used. The motor is supported from the frame by means of a cradle. It drives through an enclosed silent chain directly to the propeller shaft, which is enclosed in a tubular housing acting as torque rod. Universal points are entirely avoided in the drive. Two diagonal brace rods run from the cradle to the rear axle housing to hold the latter in alignment. The motor is controlled by a continuous torque controller giving seven forward speeds of 4, 8, 12, 15, 17, 20 and 25 miles per hour, re-

MOTOR, SHAFT DRIVE AND REAR AXLE.

on good country roads of 15 miles per hour, and to be suitable for country driving as well as for town use, as its mileage on one charge is given as about 130.

The car has a wheel base of 80 inches, a standard tread and 32 inch artillery wheels with Marsh quick detachable rims and 3½ inch Palmer web tires. The rear axle is a full floating type with Hess-Bright annular bearings in the hubs and New Departure ball bearings at the differential. The front axle is an I section drop forging with the steering rod in front of the axle and New Departure ball bearings on the knuckle spindles.

The standard battery equipment consists of a 24 cell, 13 plate Exide battery, but other sizes and makes are optional. A Gen-

spectively. The maximum efficiency is obtained at a speed at from 15 to 18 miles per hour. At this speed the battery discharge rate is well within the normal. The next lower speed of 12 miles per hour is said to be also a very efficient running speed and to give great mileage. The highest speed of 25 miles per hour is obtained by means of an accelerator pedal, but at this speed the drain on the battery is necessarily very heavy. The weight of the car without passengers is about 2,500 pounds.

The car is equipped with a combined voltmeter and ammeter of the D'Arsonval type, which is placed in a convenient corner above the window. A speedometer combined with odometer is also conveniently located, and helps to keep track of the charge in the battery. The car is steered by means of an inside side lever, and is said to be very easy to steer on account of its long wheel base. All of the brakes act directly on the rear wheel hubs, and in design follow closely the brakes used on gasoline cars.

The body is said to be particularly roomy. All of the movable windows slide up and down. There is an exceptionally large step, and a drop frame is employed which brings the floor of the car 10 inches above the step and the step 14 inches above the ground, thus facilitating ingress and egress. The company state that after experimenting with the two voltage control they decided to use 48 volts exclusively; that is, to keep all of the cells constantly connected in series, which permits of the use of the continuous torque controller. The fenders are covered with grain dash leather, and the upholstery is in imported broadcloth or hand buffed leather. The equipment includes side lamps, tail lamp, season odometer, trip odometer, speedometer, dome light and tools.

THE OHIO ELECTRIC COUPE.

#### The New Model Rainier Cars.

The preliminary announcement of its 1910 line has just been issued by the Rainier Motor Company. It lists four touring models to sell at \$4,500 with complete equipment, and a limousine and a landaulet at \$5,750 and \$5,850, respectively.

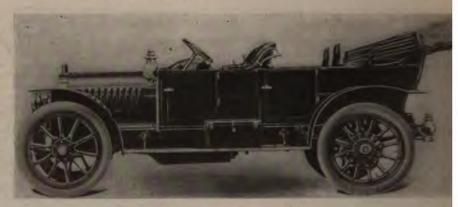

The chasses for all the models, except the baby tonneau, are identical, while the power equipment in all these models is the same—consisting of a 45-50 horse power engine of the four cylinder, four cycle type.

One of the models, the enclosed touring car, is a distinct innovation. In addition to the tonneau seat, the front seat is fully enclosed, a door opening at the left side beside the owner's seat, and there being a solid panel on the right side beside the driver. The panel is somewhat lower than the door line and the tonneau, in order to permit the easy handling of the levers; but the extra door on the left hand side is the same height as the tonneau door, making a very pleasing line from the dashboard back.

The advantage of the enclosure is obvious. It protects the occupants of the front seat from wind and weather and makes the riding there as comfortable as within the tonneau. The regular touring model is also furnished, as well as baby tonneau and close coupled car.

The Rainier car has been well known in New York for years, and 800 are said to be owned here. It has shown up prominently in various races the past season, and is to be pushed more energetically from now on in other sections of the country as well. The car is equipped with the same power as previously, has a 119 inch wheel base and exhibits no material change in the mechanical construction. It is built in three units—the power unit; the clutch, transmission and universal joint in the second unit, and the Cardan shaft and rear axle in the third unit

The motor unit is unchanged except that the oiling system has been somewhat sim-

RAINIER 1910 TOURING CAR.

plified. The motor unit is notable for its accessibility.

A change has been made in the transmission unit to secure greater accessibility and slightly better distribution of weight, the transmission and clutch being now housed in a single case with a partition to prevent oil from passing from one part to the other. The addition of a helix or screw thread to the clutch is claimed to effect a notable improvement.

The rear axle design has also been changed somewhat to obtain greater accessibility, while the brake application has been altered to secure larger braking surface and greater rigidity. The front axle design has been modified so that the steering cross rods are brought behind the front axle.

The motor is of the four cylinder, four cycle type, with 5 inch bore and 5½ inch stroke. The cylinders are cast in pairs and have large water jackets surrounding each cylinder. The valves are on opposite sides and interchangeable, and, like the manifolds, are exceptionally large. The cams are integral with the cam shaft. The cam shafts run in special bronze bearings. The crank shaft is cut from a solid bar of nickel steel. The main engine bearings and connecting rod bearings are bronze, with babbitt interlining of the inserted type. The oil reservoir is at the bottom of the crank

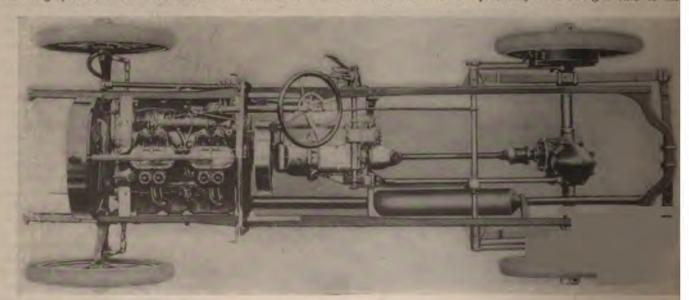

case, with a groove under each comme rod bearing. An oil pump secures cit tion, while the system of lubrication p cally eliminates all external pipes.

The water circulation is effected by a pump of the bucket type, while a fan a in cooling. The carburetor is the matic float feed type, with gravity The simplified make and break syste ignition, which has been employed in Rainier car for the past three year continued.

The clutch is a multiple disc clutch alternate steel and bronze discs, ope through a helix which causes the content to engage softly and increases its postible load on the engine increases, so slipping is impossible, it is claimed hand hole at the top of the housing mits easy adjustment or examination.

The transmission is a four speed of type, with one reverse and direct drithe third speed. Shafts and gear nickel steel. Flanges are forged integrithe shaft and gears bolted to the first Shafts run on annular ball bearings, movable cover permits the gears to billy examined, lubricated or removed, entire case is hung by a three point at sion.

wheels are 36 inches front and rear, llery type, and carry 4 inch tires in and 41/2 inch tires in the rear. The is pressed nickel steel and drops 21/2 forward of the rear axle. It has ross members. The weight of the 3.000 pounds.

Argentine Motor Club will conduct urance contest from Buenos Ayres to o and Cordoba, a distance of 650 during the month of January. Presile Archorena, of the Automobile of the Argentine Republic, offers a alued at \$200 in connection with ntest.

The Federal Rubber Company, Milwaukee, Wis., have produced an all rubber anti-skid tire, known under the above name. This is claimed to be the most heavily constructed tire on the market, and is recommended particularly for heavy limousine cars and for winter usage. A mileage of about 10,000 is claimed. The tire is considerably higher in price than any other on the market, which is due to the fact that it has a specially treated tread said to be of unusual toughness. This tread is also used on the regular smooth or plain repped tire of the company.

An American business house writes to the Bureau of Manufactures that it desires illustrated catalogs, with prices f. o. b. steamer New York, for a twenty passenger motor car for country service, and a freight car of about 40 horse power. -Refer to No. 4176.

SIDE VIEW OF RANIER ENGINE

The Simplex Chassis.

There will be few changes over the 1909 model in the Simplex chassis for 1910, made by the Simplex Automobile Company, 614 East Eighty-third street, New York city. The company's line for the coming season will comprise three models, two 50 horse power, one a toy tonneau and the other a seven passenger touring car, with 124 and 129 inch wheel base respectively. and one 90 horse power tonneau or gentleman's roadster with a wheel base of 124 inches. The cars of the company are now being sold by their own sales department, located at 1860 Broadway, New York city, instead of by the Palmer & Singer Company, as in the past.

Only the chassis is being produced. While bodies can be supplied the selection of this part is generally left to the purchaser. The chasses are produced in series, and improvements are added whenever a new series is begun, after beng thoroughly tried out on the road, instead of waiting till the end of the season.

The motors are four cylinder, four cycle, water cooled, with cylinders cast in pairs. The valves are placed on opposite sides and are actuated through roller lifters from separate cam shafts. The cylinders have a 534 inch bore and the pistons a 534 inch stroke. The outside walls of the water jackets are separated from the cylinder walls by half an inch space. The water jackets completely surround the cylinders and also the inlet and exhaust valve seats. Each pair of cylinders is secured to the crank case at the base by fourteen studs. The pistons are slightly ovaled at the top and ribbed inside, making it possible to reduce the weight without sacrificing strength. Each piston is fitted with four compression rings which have an angle joint and are pinned in place. The compression rings are all located above the piston pin and oil grooves are provided below as an aid in the distribution of lubricant. The piston pin is 11/4 inches in diameter, of chrome-nickel

SIMPLEX TOURING CAR.

steel, with a hole through the centre for supplying lubricant to the rod bearing. It is secured to the piston by means of a pressed fit and a dowel, the latter having a split end which is opened in the hollow of the piston pin.

The valves are 24½ inches in diameter at the smallest part of the 45 degree seat and 2% inches at the largest diameter, and are made of 25 point carbon steel with ½ inch stems and ½ inch lift. The cam and cam shaft are forged integral. The cams and bearing surfaces are ground to size after being hardened. The timing gears are secured to the cam shafts by means of flanges which are forged and turned integral with the cam shafts. The timing gears are of steel and mesh into the steel crank shaft pinion.

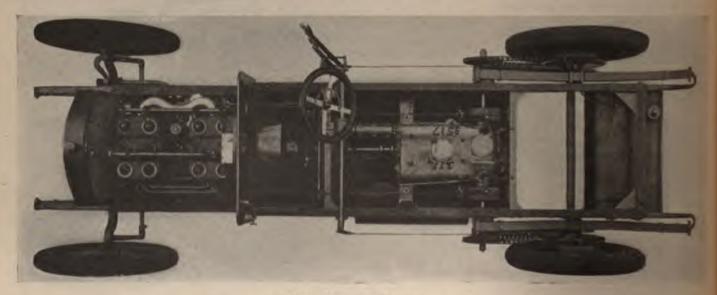

The valve lifters are fitted with adjusting screws for setting the valves. The roller and pins are hardened and provided with means for lubrication from the splash in the crank case. The lifter is fitted into a phosphor bronze guide. The connecting rods are H section drop forgings. The upper bearing is phosphor bronze, 13/4x2% inches, while the marine type lower bear-

ings are of Fahrig metal, 2 inches in dimeter and 334 inches long.

The crank shaft is drop forged from Krupp E. F. 60 point chrome-nickel stal, and has three main bearings, two plain and one annular ball bearing. Both plain bearings are of Fahrig metal, 4½ inches long and 2 inches in diameter. The ball bearing is in front. All crank shaft bearings are ground and lapped to size,

The front gears, of which there are seen, are all contained in an oiltight compariment in the front portion of the crank case. The intermediate magneto and water pump gean are mounted on ball bearings.

The crank case is of aluminum, in two sections. Pockets are provided to supply oil to the connecting rod ends when ascerding grades. The base is not sub-divided into separate oil compartments. Oil enter the base at the front. A side oil tank is carried, which is so arranged that by opening a cock at the driver's feet the crast case can be supplied with oil. There are two hand hole plates, on which are two vent tubes for relieving crank case compression. Owing to the large hore and stroke and high compression relief constroke and high compression relief constroke

#### H. & C. Tire Inflator.

mple tire inflator utilizing the burnt from the motor cylinder is manufacby the H. & C. Tire Inflator Comof Dayton, Ohio. The spent gases principally of carbon dioxide and en and are not injurious to the rubhe gases pass through a filter which ts oil and other foreign matter from g the tire. They are delivered cool, t the tire need be inflated only to sired pressure. Any pressure up to ounds per square inch is available. lter is constructed of brass tubing, iches long by 25% inches in diameter, rass caps forming the ends. On the nd a shut-off valve is located, and other end a pressure gauge for deing the pressure in the tire, and also ock for relieving the pressure in the and blowing out any impurities that ave collected. Cast integral with the aps are brackets for fastening the to the running board or other delocation. Into one of the priming cup

TRANSMISSION OF SIMPLEX CAR.

holes of one of the motor cylinders is screwed a small pipe containing a, check valve, to which is attached a ¾ inch copper tube leading to the filter. This arrangement furnishes the pressure when the motor is being operated. The inflator can be attached to any explosion motor. The outfit consists of a special non-return valve, 6 feet of ¾ inch copper tube with unions attached, the filter with shut-off valve and gauge, 12 feet of rubber tubing with standard tire connections, and one cut-out switch for cutting out the ignition of the cylinder being used if it is desired.

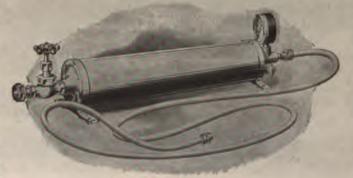

# Wisconsin Carriage Company's Cars.

A four cylinder, 40 horse power automobile has been produced by the Wisconsin Carriage Company, of Janesville, Wis., ranking among the largest manufacturers of fine vehicles in the United States. The car has been subjected to exhaustive tests, and the company are preparing for a production of 100 cars for 1910. The Wisconsin Carriage Company on October 1

completed work on a large factory building, with 75,000 feet of floor space, making its capacity more than double the previous capacity. It develops now that the new building was built for the express purpose of building automobiles, and that on October I T. E. Warnock, a well known designer, and Oliver Gleason, a factory superintendent, were engaged to work on the new car.

The car will sell at \$1,750, with optional body equipment. A close coupled and a five passenger body are offered. The wheel base is 115 inches, with 34 inch artillery type wheels, having 11/2 inch spokes and 4 inch tires. The engine is a standard four cylinder motor, water cooled, measuring 43% by 43% inches, with an A. L. A. M. rating of 405% horse power. The improved Schebler carburetor is used. The motor is equipped with a double ignition system, Bosch high tension magneto and coil and timer. The transmission is selective, with three speeds forward and reverse, running on annular bearings. The clutch is of the cone type, faced with chrome leather on springs for gradual engagement. The car

has a full floating type rear axle of pressed steel, enclosing the drive shaft in a torsion tube. The front axle is a double channel section pressed steel. Rear springs are three-quarters and front springs semi-elliptic. The car has not yet been named, and it has not been announced when deliveries begin.

H. & C. TIRE INFLATOR.

#### The New Columbia Gasoline Car.

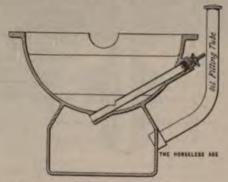

The new gasoline car of the Columbia Motor Car Company, Hartford, Conn., has already become known to the public by its participation in the Fairmount Park race and the Wheatley Hills Sweepstakes race. It is known as the Mark 48, Lot 4, and is really a continuation of a type which has been manufactured for five years. The car is provided with one of four different styles of bodies, viz., a five passenger touring body, a four passenger roadster body, a seven passenger limousine body and a seven passenger landaulet body. The company also make prices on the chassis with both touring and limousine body, and both touring and landaulet body, as well as on the chassis alone and the different styles of bodies alone.

The motor is a four cylinder vertical one with the cylinders cast in pairs. The bore is 4.5 inches and the stroke 4.7 inches, giving a rated horse power of 32.4 on the basis of the A. L. A. M. formula. The cylinder heads are, of course, integral with the cylinders, and are machined on the inside. All of the valves are located on one side of the engine and operated from a single cam shaft. The cylinders are cast in pairs, with the water jackets integral.

The cooling system comprises a cellular radiator, a flywheel fan and a positively driven centrifugal pump. The well known Columbia float feed, double jet carburetor, with two separate throttles and two automatic auxiliary air valves, is used. Both of the mixing chambers are water jacketed. The ignition equipment is somewhat of a departure from conventional practice. Two absolutely independent systems are provided. One of these consists of a Bosch low tension magneto supplying current to make and break devices and producing a contact spark. The other system comprises an Exide storage battery as the source of current, and a Seeley high frequency spark system operating on the high tension principle. The time of the spark can be varied

by means of a finger lever on the steering wheel. There is also a throttle lever on the steering wheel, by means of which the engine governor can be caused to act at any speed from 5 to 20 miles per hour. The governor controls one carburetor jet through a small butterfly valve, giving a very fine adjustment, while the pedal operated accelerator controls a separate jet through a large butterfly valve for quick acceleration and fast running.

The engine is lubricated entirely by splash, the oil level in the crank case being maintained by means of adjustable overflow

OIL LEVEL ADJUSTMENT IN COLUMBIA ENGINE,

dams. The oil is constantly circulated and replenished after having been strained, by a positively driven gear pump. All of the bearings in the engine are of bronze and babbitt lined. The muffler is of the Powell type and is claimed to give a very silent exhaust combined with slight back pressure.

A conical clutch is built into the flywheel; it is leather faced and contains a series of small aluminum shoes backed by springs, which are designed to insure gradual engagement. The change gear is of the sliding type, and affords three forward speeds and one reverse. The highest forward speed is a direct drive. The shafts and gears are all of chrome-nickel steel, and the bearings are

Hess-Bright ball. The drive to the floring rear axle is by a shaft and bevel gear. The universal joints of the propeller shaft on completely enclosed within grease retaining covers. The rear axle is mounted in Token "short series" roller bearings, which are also used in the front wheels. The fine axle is an I section drop forging made complete with steering knuckles and spring seats in one piece without welds.

The frame, which is pressed from carbo steel, is narrowed in front, and is supposed on semi-elliptic springs in front and real made of a large number of thin leave of alloy steel. The car has a wheel base of 115 inches and the regular standard 56 into tread. The road clearance is 11 inches. The road wheels are of the wood artillery patern with forged steel hubs and Hartford universal quick detachable rims. The the equipment of the open cars is 34x4 inche all around, and on the closed cars 344 inches in front and 34x4½ inches in the rear, all tires being Hartford quick detachable clinchers.

Color options are given between gress and red for the touring car; green, red ml gray for the roadster, and green, blur and maroon for the closed cars. The open an are upholstered in hand buffed black leather, and the closed cars in green, blue or maroon leather or broadcloth. The equipment of all cars includes two acetylene hadlights, two oil side lights, an oil tail light an acetylene generator, horn, muffler ouout, trunk rack, tire carriers, tool box, as tra luggage box and a complete set of tools The touring car and roadster are fitted with a robe rail and foot rest, while the closed cars are provided with electric annunciator, dome light, toilet case, watch, mirror, scet bottles and cigar lighter. Ample rain boots are also furnished with each car.

A photograph of the roadster is shown herewith, and a cut of the touring car will appear in our Madison Square Garden Shw Number.

COLUMBIA MARK 48 ROADSTER,

Velie, 1910.

The Velie "40," manufactured by the Velie Motor Vehicle Company, of Moline, Ill., is an entirely new product, embodying some of the best features of the former "30." This model will be furnished in several different styles, including a five passenger touring car, a roadster, with the option of rear seat equipment, and a toy tonneau. The standard finish will be Velie blue, but an option is given on primrose cream wheels and Velie red throughout. The car, equipped with two gas head lights, two side oil lamps, one oil tail lamp, gas, generator, storage battery, tool kit and tire repair outfit, sells for \$1,800.

The motor is a four cylinder, four cycle, water cooled one of 41/2 inch bore and 51/4 inch stroke. The cylinders are cast in pairs and are offset three-eighths of an inch from the centre of the crank shaft. The valves, which are 2 inches in diameter, are all on the left side and operated by a single cam shaft, while on the right side are located the gear driven centrifugal pump and magneto, which latter is also driven by the pump shaft. The water jackets are very spacious, the water being discharged through a forked brass pipe into the jackets at the bottom on the left side, with the outlet from the top midway between the cylinders in each pair. This arrangement takes the water from the hottest portion of the cylinders and keeps the water flowing to this point.

The valves are drop forged from nickel steel, with the lower ends of the stems hardened, while both stems and seats are ground accurately to size. The valves are operated by roller lifters, which are equipped with screws for adjustment. The connecting rods are drop forged from high carbon steel, with phosphor-bronze bearings at the top and white bronze lower bearings. The crank shaft is drop forged from high carbon steel, heat treated, and is finished all over; it has three main journals running in white bronze bushings. The solid web cast iron flywheel, in which the three dry plate clutch operates, is fitted to

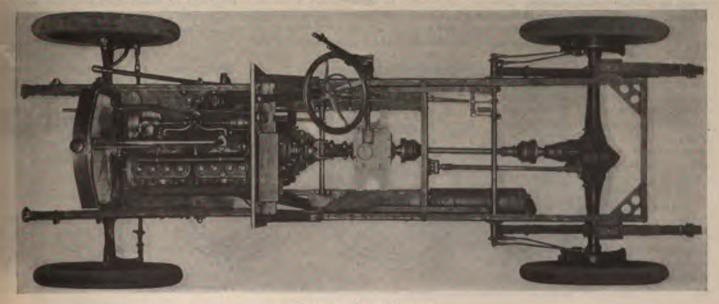

VELIE 1910 TOURING CAR.

the crank shaft by means of a taper bearing, key and lock nuts.

The cam shaft is of high carbon steel with cams forged integral, and is carried on annular ball bearings. The pump, magneto and commutator shafts are also carried on annular ball bearings. The pistons are fitted with three compression rings above the piston pin and oil grooves to aid the distribution of oil below the pin. The ball bearing fan is flat belt driven and supported by a bracket secured to the forward end of the crank case. In the upper portion of the fan bracket is fitted an eccentric into which the fan stud is screwed, providing adjustment for the fan belt. The circulation of the cooling water is effected through a centrifugal pump of large dimension, a six blade fan and a square tube radiator.

The crank case is of aluminum alloy, in two main parts, with a gear compartment cover in front and a bearing cover at the rear. The case is not parted at the bearing centre line, as is the general practice, but the upper portion forms a barrel in which is located the crank shaft and its bearings. The lower portion is simply the oil reservoir, from which the oil is drawn by means of a gear pump driven from the lower end of the commutator shaft. The oil is pumped from the reservoir through a sight feed located on the dash, so the driver can tell at a glance whether the oil is flowing to the crank case bearings. Pockets are provided into which the connecting rods dip, and are so constructed that a constant level of oil is maintained.

The ignition differs considerably from the general system employed, there being three separate and distinct systems, two of which work through one set of plugs and one through another. The low tension magneto and storage battery work through a synchronized coil on the dash, and through the magneto distributor; this makes two systems, as ordinarily embodied in dual equipments, while the storage battery, working through four unit coils, and the commutator form the third system of ignition. Every motor is provided with a foot accelerator and muffler cut-out, which are located between the clutch and brake pedals, and pressure of the foot on these small pedals opens the throttle and muffler cutout simultaneously, or they can be operated

PLAN OF VELIE CHASSIS.

VELIE REAR CONSTRUCTION SHOWING ACCESSIBILITY OF DIFFERENTIAL

independently. A crank case compression relief and oil filler is located on the left front motor hanger arm.

The clutch is, as above stated, of the three dry type, with a slip square between it and the transmission, and a brake that works in unison with the pedal and stops the shaft from spinning, thus permitting the gears to be changed quietly. The slip square gives a universal action between the clutch and transmission, preventing the binding of transmission gears over rough and uneven roads.

The transmission is of the selective three speed type, with both shafts carried on Timken short series roller bearings. The gears are 3½ per cent, nickel steel, hardened and ground.

The propeller shaft between the transmission and rear axle is provided with two double universal joints of the cross and roller type, the transmission and drive pinion shaft ends being squared.

The rear axle is a Timken full floating type, with the differential casing and wheels carried on Timken toller bearings. The front axle is a drop forged I section Timken axle, with steering arms located behind and above the axle. The brakes work through equalizers on the rear wheel drums, and are internal expanding and external contracting, respectively, and operated in the usual manner. The front springs are semielliptic, 2 inches wide and 38 inches long; the rear springs are three-quarter scroll elliptic, 2 inches wide and 46 inches long. The wheel base is 115 inches, and a 34x4 inch quick detachanble tire equipment is furnished.

#### Milwaukee Tool Grinder.

These tools have an iron case very accurately machined, and when assembled are oil tight, which protects the gears and bearings from the fine dust from the emery wheel and holds the oil, keeping the bearings lubricated and reducing the wear to a minimum. The driven shaft that also carries the grinding wheel is supported at both sides of the driven pinion by liberal bearings. The driving gear is also supplied with two bearings, one on either side on

the crank shaft. At the lower part of the case are two projecting prongs which rest on a cable or bench, and below this is a thumb screw which sets up against the bottom and permits of quickly fastening or removing the grinder from any bench or

table. The gears are all accurately machined and mesh perfectly, thus causing them to run quietly and smoothly with very little friction. The ratio of the gears permits of very high speed of the grinding wheel, with low speed of the crank. The universal tool rest is claimed to be strong and simple, and can be set on either side of the wheel and adjusted to any angle or position desired. These grinders are made by the Garage Equipment Manufacturing Company, of Milwaukee, Wis.

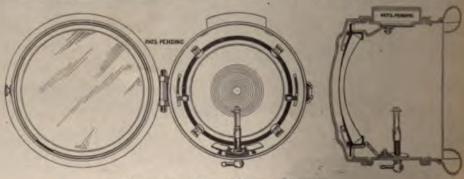

#### Manhattan Swell Front Headlight.

We illustrate herewith the new swill front design of double metal headlight made by the Manhattan Screw and Stamping Works, West End avenue and Sixtyseventh street, New York city, for 1910 The lamp consists of two full shells, each supporting the other, and is claimed to be twice as strong as a single shell lamp. By rolling in the swell front to a smaller diamcter than the body, the side shadows and side glare are said to be cut out. Great pains have been taken in the design to insure a clean lamp. The expanding collar permits of the use of a solid front glass The flat flame burner is claimed to be inpossible to choke, and it is also claimed that it will not crack the glass or the mirror. All bolt heads, screw heads and couplings are on the inner body, and the outside is therefore smooth and clean.

#### Personnel of Owen Motor Car Company.

The Owen Motor Car Company, which, as announced in a recent issue of The Horseless Age, has been organized in Detroit by Ralph Owen and the Smith Brothers, who were formerly connected with the Olds Motor Works, of Lansing, Mich., will turn out a 52 horse power, long stroke car, to sell at \$3,200. The officers of the company are Edward Turnbull president, Angus Smith treasurer, and Ralph Owen general manager. The company have bought a nine acre plot on the boulevard on which there is a four story fox750 foot factory building. It is planted to turn out 500 cars next year.

The space in the lobby of the Hotel Breslin, New York, will this year be occupied by a Premier during the Palace Show, and a Chalmers during the Garden Show.

MANHATTAN SWELL FRONT HEADLIGHT.

### THE FIELD OF COMMERCIAL APPLICATIONS.

o-operative Delivery Service. umber of merchants in Sioux City, Ia., formed a partnership for the purpose nducting a co-operative delivery ser-By giving an order for the total er of vehicles required for the serhey expect to save on first cost, and nducting a centrally located co-operaarage to greatly reduce the cost of care aintenance. The garage expenses will irged on a pro rata basis against each e, and all supplies will be furnished mbers at cost. A competent mechanic e engaged to act as superintendent of rage, and will be held responsible for ndition of all vehicles intrusted to his The trucks will be carefully inspected night, the tanks filled, batteries tested he vehicle turned over to the driver morning in first class condition. The ntendent will instruct the drivers in peration and care of the vehicles. One o reserve vehicles will be kept on and in case one of the trucks breaks on the road the driver will telephone garage, and one of the reserve vehiwill be sent out immediately to take load and complete the trip.

e association plans to purchase about en heavy trucks and two light delivery as within the next ninety days. All e prominent makers of motor trucks elivery wagons will be asked for demtions of their vehicles. The members at first to be limited to twenty-five and the first meeting is to be held week.

#### g Distance Motor Trucking.

Van Sciver, of Camden, N. J., opertruck daily between Camden and At-City, a distance of 60 miles, and states e can handle the merchandise to be red in Atlantic City quicker than he train, with less handling and at oneless expense. It avoids expensive ng of his goods and carries them difrom his factory to the customer. before it was necessary to carry them railroad station, send them by freight, artage at the other end. We are ind that the trucks make the 120 mile rom Camden to Atlantic City and reeach day, carrying a load in both dins. The trucks used are 31/2 ton Re-

#### ial Car for Harriman Branch Roads.

accompanying illustration shows a l car ordered by E. H. Harriman beis death, which is to be used on a prioad running from a point on the Erie oad to the Harriman private residence. car is a Lambert friction drive, and was ordered for the purpose of ascertaining whether a gasoline car for from twelve to fifteen passengers could be utilized more economically than steam cars on branch roads on the Harriman lines. As shown by the illustration, the car is especially constructed throughout, and is unique in that it is the first car ever manufactured for a similar purpose.

#### Commercial Notes.

Automobiles are to be placed in service in Dayton, Ohio, for collecting the mail at the various stations and factories during the day, so as to have it ready for shipment before the evening rush sets in. A motorcycle is now being used by the department for delivering special delivery letters, and another will probably be added shortly.

W. D. Foil Company, liverymen of Mount Pleasant, N. C., have organized an automobile company for the purpose of operating an automobile line between that place and Concord. They propose to put in operation a five passenger, 40 horse power machine, and to make two trips to Concord daily, one of which will carry the mail. Side trips to other towns will also be made for the convenience of special parties.

The Minnesota State A. A. held a meeting at the Plaza Hotel in Minneapolis last week, at which it was decided that the fiscal year shall hereafter end in January instead of in April. The annual meeting of the association will be held in St. Paul about January 15. The railroad fares of the official delegates will be paid out of the association's treasury hereafter, which is expected to insure a larger attendance. Owing to the increase in membership it is likely that an office of second vice president, and perhaps also third vice president, will be created at the meeting.

The motor patrol wagon of the Omaha (Neb.) police department was destroyed by fire on November 19, and a request for an allowance of \$10,000 to make good the

loss has been made by the police department to the city council, but action on the request has been deferred. The motor patrol caught fire while its driver was working underneath it when the drain plug or cock of the gasoline tank accidentally dropped out and the spilled gasoline was ignited by an alcohol burner.

Gasoline motor car service has been established between Dayton and Wallula, via Walla Walla, Wash. The service has been urged by commercial organizations along the route for several years.

The board of public safety, Indianapolis, is in the market for a 1½ ton truck to be used by the electrical force of the police department, and to cost not more than \$1,500. A similar vehicle is used by the electrical force of the fire department.

#### Chicago Taxi Drivers Organize.

The Auto Drivers' Protective Association has been organized at Chicago, and opened headquarters at 134 Washington street. The membership is comprised mainly of taxicab drivers, and the object of the association is to furnish free legal advice in case of arrest of members for speeding. The initiation fee is \$2 and the monthly dues are 50 cents. The officers are: Walter W. Wilcox, president; Taylor S. Snow and Frederick McH. Kitching, vice presidents; Neil Gronberg, secretary; Roy O. Gilbert, treasurer; Edward M. Seymour, counsel and John Flood, medical director.

#### Ohio Road Construction Estimate.

State Highway Commissioner J. C. Wonders, of Ohio, has filed with the Auditor of State estimates for the needs of the department for road improvement for 1910. He asks for \$880,000, or \$10,000 for each of the eighty-eight counties of the State. He also asks for additional money for the employment of engineers. Last year the appropriation for road improvement was \$5,000 per county.

LAMBERT FRICTION DRIVEN CAR MOUNTED ON RAILWAY TRUCK,

#### Edgewater-Fort Lee Hill Climb.

Owing to congested traffic and inability to control the crowds, the Fort Lee hill climb, run under the auspices of the Edgewater-Fort Lee Automobile Association last Saturday, was called off by Referee Whiting after only eight of the fourteen events had been run. The course is very irregular, with a sharp bend before the finish line. but the track had been put in excellent condition, and very fast time would have been made but for the crowds and the total lack of consideration on the part of many automobile owners and drivers, as well as drivers of horse vehicles. These people asserted their right to continue on their way, and refused to be detained even during a contest, and the police were powerless. This headstrong action was entirely inexcusable, as there was another route around the hill course which was only a couple of blocks out of the way. Then the spectators showed great lack of judgment by flocking onto the track, completely filling it for nearly its full length, and it is a wonder that no one was injured. As it was, Klebes on a Reading-Standard motorcycle, in trying to avoid a collision, ran into a ditch and was thrown, but escaped bodily injury, though the front wheel of his machine was demolished. Tom Kincaid in a National made the quickest ascent in the classes for cars, in 56.57 seconds, while Chapple on an Indian motorcycle made the 3,000 feet in 50.15 seconds. In the Class A event, for commercial motor vehicles, a Buick delivery wagon climbed the grade in 2:34.48.

After the contest had been declared off many of the drivers of the large, powerful cars which had been waiting to compete in their several classes drove up the hill in a reckless manner, and it is a wonder that someone was not seriously injured.

At a meeting of the promoters held immediately after the events were called off, it was decided to run off the remaining events some day during the following week, as some thirty odd cars, many-of them high powered, were unable to compete at all.

# Publication of Contest Rules Deferred.

The contest board of the A. A. A. held a meeting in New York on Monday at which the contest rules for 1910 were discussed. Mr. Butler, chairman of the board, states that the rules will probably not be published before the first of the year, owing to the fact that no agreement has yet been reached on several points.

#### Metzger Company May Secure Selden License.

The Metzger Motor Car Company, of Detroit, are negotiating for the purchase of the business of the Hewitt Motor Company, of New York, including the Selden license of the firm. The deal will probably be decided one way or the other this week. In the latest edition of the "Handbook of Gasoline Automobiles" the P. & S. (Palmer & Singer) car is listed under the Hewitt license and the White under the Waltham license.

#### Indianapolis Meet, December 17-18.

A race meet will be held on the Indianapolis Motor Speedway, at Indianapolis, on December 17 and 18, at which time attempts will be made to lower the records established recently at the Atlanta Speedway. This will be the first meet over the course since the construction of the brick pavement. The track, it is believed, will be completed some time this week. A few days will be required to let the pavement "set," after which drivers who are to compete will be given an ample opportunity to practice before the meet.

There have been a number of changes in addition to the repaving since the meet last August, which resulted in several persons being killed. As an element of safety, a concrete wall, three feet high and twelve inches thick, has been built around the course. New grand stands have also been erected and the old ones enlarged, so that the seating capacity has been largely increased. Ernest A. Moross, director of contests, is now arranging the program, the A. A. A. having granted its sanction for the meet. Efforts will be made to lower practically all records held by the Atlanta and Brooklands courses.

The speed trials will include distances of one-fourth, one-half and one mile and also one kilometer. Others will be from two miles to 1,000 miles, drivers to be changed frequently in the latter. There will be races for all of the classes under the A. A. A. rules and also a number of free-for-all events. Among those who will participate are Walter Christie, driving his Christie car; Louis Strang, driving a 200 horse power Fiat; Barney Oldfield, driving a Benz, and possibly a Knox; Ray Harroun, driving a Marmon "32," and John Aitken. driving a National "40." The management expects about thirty well known drivers to compete. During the 1910 season it is understood six meets are to be held on the course, including two for aeroplants and dirigible balloons.

ONE OF THE TURNS ON THE FORT LEE HILL.

Mile High Climb at Redlands, Cal.

Thirteen cars competed for first honors in the Thanksgiving hill climb held at Redlands, in southern California, and to the unlucky number of the starters some of the drivers ascribe the ditching of four of the entries on the tortuous grades and dangerous dips of the course. The contest was unique in many respects. The cars started among the tropical orange groves of the valley, shot between rows of magnolias. pepper trees and palms at top speed, and finished in a driving snow storm almost 6,000 feet above the starting point, after having traversed a course 15.1 miles long, rising from level stretches at the start to grades exceeding 20 per cent, at the finish, abounding in sharp turns and sudden dips after steep hills. The length of the course and continual rise of the road over a distance of more than 12 miles gave the results real interest, since the usual hill climb of a mile or two is insufficient to test the endurance of modern motor cars.

Despite the snow on the heights, and the slight drizzle and fog in the valley, last year's records were lowered by more than one contestant. The Apperson Jackrabbit, driven by Hanshue, made the fastest time of the day in the free for all, covering the distance in 22m. 71/2s., almost two minutes better time than the Stoddard-Dayton, holder of last year's record. The Apperson's fast time was made despite the fact that the car in a previous race had lost a wheel on a dangerous turn, and had been fitted hastily with a wheel from another car. A Maxwell, driven by C. B. Smith, almost approached the Apperson's time in the free for all, finishing in 22m. 35s.

Though the mishaps were numerous, only one man, James Gordon, the driver of a motorcycle, came to grief. His machine skidded on a curve soon after the start, hurled him to the pavement and broke his leg.

The American Simplex, driven by H. Erickson, with G. G. Corey as mechanic, became the victim of the most serious accident. At Casa Blanca, 3 miles from the finish, the road rises sharply, dips down a steep hill and at the same time describes a curve. While descending the hill at high speed the rear wheels of the Simplex skidded on the turn, the car swung around and turned over. Herrick was caught under the machine by his overcoat, but managed to slip out and assist the mechanic, who had been thrown clear of the machine, in putting out the fire originating close to the leaking gasoline tank.

The Corbin, driven by A. Livingstone, came to grief shortly after passing the same place. A steering knuckle broke and the anageable car headed into a bank of earth, throwing out both driver and chanic, though the machine did not turn

The Buick also skidded at the Casa Blanca turn and dip, the rear wheel striking the bank. Several bolts in the wheels were sprung, but nevertheless the driver finished the race and won in his class, though the damage prevented the participation of the car in the free for all.

Both in number of entries, in the size of the crowd that viewed the races along the course, and in the speed made, despite disadvantageous weather conditions, the contest exceeded last year's races. Redlands automobile dealers and owners have formed the Mile High Hill Climbing Association, which managed this year's event, and will try to arouse an even more extended interest for next year's contest.

The results of the various races were as follows:

For motor cars with piston displacement c\_ 231 to 300 inches—First, Maxwell; C. B. Smith, driver; time, 22m. 46s. Second, Pullman; Geo. Kurran, driver; time, 25m. 36s. Third, Cadillac; Walter McKeague, driver; time, 27m. 38s.

For motor cars with piston displacement from

For motor cars with piston displacement from 301 to 450 inches—First, Buick; L. N. Kerla,

driver; 24m. 55s.

For cars with piston displacement from 451 to 600 cubic inches—First, Matheson; A, Renton, driver; time, 24m. 35s.

Special match race—First, Regal; Anthony, driver; time, 31m. 11s. Second, Ford; R. Stearns, driver; time, 38m. 35s.

Free-for-all—First, Apperson; H. Hanshue, driver; time, 22m. 7½s. Second, Maxwell; Smith, driver; time, 22m. 35s. Third, Palmer-Singer; F. Seifert, driver; time, 22m. 55½s. Fourth, Chadwick; H. C. Kennedy, driver; time, 23m. 3½s. Fifth, Matheson; A. Renton, driver; time, 24m. 33s.

Motorcycles, free-for-all, from start to Casa Blanca, 10½ miles—Indian, E. Knappe riding, first; time, 15m. 49s. Second, Thor, T. Mulvihill riding; time, 16m. 27s.

Single cylinder motorcycles, same distance— First, Harley-Davidson, C. H. Clemon riding; time, 16m. 36s. Second, Harley-Davidson, R. Langford riding; time, 17m. 30s.

#### Stevens-Duryea Private Testing Track.

The Stevens-Duryea Company will construct a private testing track on a tract of land a little more than 2 miles from the Hotel Imperial, Chicopee Falls. The track will be 30 feet in width and will be paved with brick set on edge. The total cost of the track, which is expected to be ready for use next May, will be between \$30,000 and \$35,000. The importance of a private testing track is being recognized by all of the larger makers, as it avoids frequent complaints regarding speeding of testers on the public roads and also the ocasional accidents to pedestrians which are usually very costly to the manufacturers, as well as extremely annoying.

#### New Members of Accessories Manufacturers' Association.

The Motor and Accessories Manufacturers, at a meeting held in New York city on November 27, elected the following additional members: Auto Parts Manufacturing Company, Batavia Rubber Company, Driggs-Seabury Ordnance Corporation, Excelsior Motor and Manufacturing Company, Havoline Oil Company, Royal Equipment Company, the Seamless Rubber Company, Warner Manufacturing Company and Thermoid Rubber Company.

Metzger's Novel Sales Organization.

Automobile men from the Eastern and Western extremes of the country gathered in Detroit, on Nevember 29, to take part in the final organization of the selling department of the Metzger Motor Car Company. The United States has been divided into fifteen sections, and the representative in each is a stockholder in the parent company, something new in the industry. Every feature of the work and the prospects were carefully gone over by men who are among the best known in the trade. The morning session was at the factory and the afternoon was spent "at school" in the Pontchartrain. A dinner at Swan's followed. In addition to B. F. Everitt, William E. Metzger and William Kelly, of this city, those in attendance at the business meetings were: N. H. Parker. Indianapolis; W. Wayne Davis and M. B. Fletcher, Philadelphia; William Coon and F. B. Packwood, Lincoln, Neb.; A. R. Kilburn and F. S. Day, Kansas City; Walter and H. A. Githens, Chicago; H. J. Koehler and W. H. Whitt, New York; C. Arthur Benjamin, Syracuse; J. W. Bowman, Boston; W. M. Johnston, Denver; H. O. Harrison, San Francisco; John A. Sibley and W. J. Casterton, Detroit. The plan of or-ganization will be a novel one on the cooperative plan. Each dealer present subscribed to from \$5,000 to \$25,000 worth of stock, the subscriptions aggregating \$125,-000, and purchased from 100 to 500 cars, taking the entire factory output of 2,500. They will act as factory representatives in their respective districts.

## To Manufacture Runabouts in Akron, Ohio.

A corporation is being organized to locate a factory in Akron, Ohio, for the manufacture of runabouts. O. V. Dibble, president of the Buckeye Match Company, of Wadsworth, will be president and general manager, and C. R. Forth, a graduate of the Massachusetts Technical Institute, will be superintendent. Mr. Forth was consulting engineer with the Overland Company last year. S. E. Leonard, a traveling salesman, of Greenwich, Ohio, will be sales manager. It is the intention to manufacture 500 cars the first year and employ 175 men. A plant in Akron will be leased.

Alden Sampson, 2d, Dead.

Alden Sampson, 2d, manufacturer of automobiles, died of pneumonia at his country place in Pittsfield, Mass., on December 3. He was thirty-one years old, and a son of the late E. Pope Sampson, of New York. He was born in New York and educated there. In 1902 he began the manufacture of automobiles in Pittsfield, where he built a large plant. At first touring cars were built, but later attention was confined to commercial vehicles, and a gasoline motor truck was the latest product of the factory. He is survived by his widow and one son, Alden Sampson, 3d, and his mother, Mrs. Florence Sampson, of New York.

### AUTOMOBILE LAW AND LEGAL EVENTS.

#### Recent Decisions.

BACKING WITHOUT WARNING NEGLIGENCE.

To reverse a standing automobile, without warning, colliding with a pedestrian waiting at a crossing for an approaching car, was held negligence, and a master was held liable for acts of his employee in the scope of his business, though done without his knowledge. Personal examination of an injured plaintiff may be required, but failure to order was held harmless where the evidence was clear as to the extent of the injury.—Shamp v. Lambert, Mo., 121 S. W.. 770.

#### CONFUSION OF BEGINNER.

A beginner who became "rattled" was held guilty of negligence when he could have stopped the automobile and avoided injuring a pedestrian, although she was also "rattled," as her act was involuntary, caused by terror. Three thousand two hundred and fifty dollars for fracturing thigh of an old lady is not an excessive verdict.—Navailles v. Dielman, La., 50 So., 449.

### SPEEDING AND FRIGHTENING HORSES CAUSE FOR ACTION.

Driving a car in a city 25 miles an hour, contrary to ordinance, and frightening a team by such speed, and causing it to run into plaintiff's wagon, injuring him, was actionable.—Grant v. Armstrong, Wash, 104 Pac., 632.

#### SPEEDING AT CROSSINGS.

The driver of an automobile approaching a crossing in a city at a fast speed without warning, and injuring a nine year old child, was held guilty of negligence. Such a child was held not required to use the same care as an adult.—Gross v. Foster, App. Div., 118 N. Y. Supp., 889.

#### MEASURE OF SIGHTSEEING PROFIT.

In an action for breach of contract in failing to operate a "sightseeing car" and to divide profits, the measure of damages. "that 170 trips could have been made at so much profit for each trip" was held erroneous, as that was based on the assumption of good weather and full loads every trip.—Zabinsko v. Garage, App. Div., 118 N. Y. Supp., 959.

#### Gas Tank Litigation.

The Auto Lux Manufacturing Company, of Milwaukee, Wis., and P. C. Avery and George E. Burnham, proprietors, have been made defendants in a suit brought by the Prest-O-Lite Company and Commercial Acetylene Company, of Indianapolis, alleging infringement of patents. A temporary injunction has been granted the plaintiffs by the Federal court at Milwaukee. The suit is partly the outgrowth of the fatal explosion which wrecked the plant of the Gas Tank Recharge Company, of Milwaukee, on November 29, killing George L. Odenbrett,

a well known automobile agent. It appears that the Auto Lux Company sold the gas tank concern a generator which is held to be an infringement on patent rights held by the plaintiffs. Among the exhibits is a bill for two cans of carbide from the Auto Lux concern to the Gas Tank Recharge Company, the bill having been found in the ruins.

More than a year ago the Prest-O-Lite Company brought suit against the Avery Portable Lighting Company for infringement of patent. The Milwaukee company produced a small gas tank for automobiles. The Federal court decided in favor of the Indianapolis company and the Avery concern went out of business. P. C. Avery shortly afterward formed the Auto Lux Manufacturing Company.

# Severe Punishment to Break Up Joy Riding.

In an attempt to break up joy riding, Judge Whallon, of the Indianapolis Police Court, has just assessed the heaviest penalty for such an offense in the history of the city. The defendant was Harry Hackelman, driver for a banker, who took his employer's machine on Thanksgiving night, winding up early the following morning by colliding with a cab and slightly injuring two people. Hackelman was intoxicated and the police judge fined him as follows: For operating an automobile while intoxicated, \$1 and costs and sixty days' imprisonment; profanity \$1 and costs; malicious trespass, based on damage done the automobile which was used without permission, \$200 and costs and sixty days' imprisonment; malicious trespass, based on damage to cab, \$200 and costs and sixty days' imprisonment; and violating speed law, \$50 and costs.

#### Further Protests Against French Fuel Tax Proposal.

A delegation of the French Automobile Manufacturers' Association (Chambre Syndicale) has made a formal protest against the projected increase in the duty on gasoline and benzol to the Minister of Public Works, the Minister of Commerce and the Budget Committee of the Chamber of Deputies. Marquis De Dion, with the aid of statistics, proved that the automobile movement even now paid something like 50,000,-000 francs annually into the treasury of the republic, and that any additional burden would hamper its development and be a menace to the industry. His explanations are said to have produced a very profound impression, and the ministers and the committee assured the delegation that they would once more go over the tax proposals of the Government.

# Licensed Association Advertising Men Organize.

Fourteen representatives of advertising departments of licensed automobile manufacturers met at the headquarters of the A. L. A. M. in New York on Tuesday with the object of forming a permanent organization. It was agreed at the very outse that nothing should be done to restrict the initiative and the freedom of action of any of the members. It was the sentiment of those present that much help might be derived and some saving of money effected for the companies by the interchange of ideas and experiences on how to prevent any part of the advertising appropriation being diverted from its proper channel. A committee composed of Arthur N. Jervis, Chas. W. Mears and K. P. Drysdale was appointed on permanent organization. R H. Johnston and C. A. Stein were elected temporary chairman and secretary respectively. The following advertising managers were present: Arthur N. Jervis, Alco; K. P. Drysdale, Cadillac; H. W. Ford, Chalmers; Guy Hutchinson, Corbin; B. Rockwell, Maxwell; H. L. Foote, Peerless: Gen. M. Davis, Pierce-Arrow; H. A. Linehard, Pope; C. William Wurster, Stearns; C. A. Stein, Stevens-Duryea; E. Le Roy Pelletier, Studebaker; F. L. Faurote, Thomas; R. H. Johnston, Waltham-White, and Chas. W. Mears, Winton.

#### Cadillac Wins Oklahoma Race.

Norman Smith, driving a Cadillac car, won the Oklahoma-El Reno race, held on Saturday, November 27, and came into possession of the cup offered by the Oklahoma A. A. The race was full of thrilling incidents, due largely to the roughness of the roads. The distance is 67 miles, and this was covered by Smith in 1:53.13. A Franklin, driven by Ray Colcord, finished second in 1:57, and an Oldsmobile, driven by Baird, finished third in 2:02.

A Ford car, driven by Fred Winkle, turned turtle 10 miles out of Oklahoma City, and pinned Winkle beneath it, but he miraculously escaped with slight injuries. The Velie car, driven by A. Donovan, ran into a ditch some 6 miles from El Reno, but Donovan was uninjured, except for a few scratches. There were eight starters as follows: Mosely (Knox), Baird (Oldsmobile), Colcord (Franklin), Maxwell (White steamer), Smith (Cadillac), Dixon (Sellers), Burroughs (White steamer), and Winkle (Ford).

The police of Toledo, Ohio, have inaugurated a crusade against speeders, and six drivers were arrested by two motorcycle policemen on November 27.

### GARAGE AND SALESROOM.

# Buffalo Dealers and Club Unite for Show.

The Buffalo Automobile Trade Association and the Buffalo A. C., which planned to hold a show each next spring, have reached an agreement and decided to hold only a single show under their joint auspices in the old Broadway Arsenal during the second week in February. A committee of the Trade Association, consisting of G. H. Poppenberg and Charles Monroe, and another committee of the club, consisting of Harry T. Vars and Laurens Enos, will meet shortly to complete the details.

#### Wichita (Kan.) Dealers' Show This Week.

The dealers of Wichita, Kan., following the example of their Kansas City, Mo., confrères, have agreed to disagree on the show question, and four of them will exhibit at their own salesrooms during the present week, and the rest at the new building on Haymarket square. The secessionists were displeased at a decision of the management to use the Haymarket building instead of the vacant site opposite the post office, which necessarily entailed more expense, and was also less convenient for most of them.

#### Dealers' Association Notes.

The Hartford Automobile Dealers' Association will hold their third annual show in Foot Guard Hall during the week of February 14. The show committee consists of Fred W. Dart, Ed. G. Biddle and Wm. L. Ledger.

The dealers of Fort Worth, Tex., formed a temporary organization at a meeting held in the Board of Trade Building on November 23. H. E. Crowley, of the Texas Sales Company, was elected temporary chairman and Earl Vernon temporary secretary. A membership committee of three was also appointed to call on all of the local dealers.

The Louisville Automobile Dealers' Association has decided to hold a show either in March or early in April, probably in the armory. Last spring the show plans of the association were frustrated by inability to secure a proper show building, and instead of a regular show a dealers' opening week was arranged, together with an automobile service between the various salesrooms, which proved fairly satisfactory.

#### Garage Notes.

Allentown, Pa.—The Allen Motor Car Company's garage on Tenth and Hamilton streets has been completed. The company are agents for the Studebaker cars.

Appleton, Wis .- The Griffin-Scott Company has been organized to assume the Outagamie district agency for the Buick, held by J. E. Stanton & Son. The new firm has purchased the Ullman Building, occupied as garage and salesrooms by the Stanton concern. Chester I. Scott and Harry Griffin, in Appleton, are the new owners.

Beaumont, Tex.—The Neches Motor Car Company, successors to the Texas Motor Car Company, will make extensive alterations and additions to their garage on Orleans street.

Beeville, Tex.—The Beeville Automobile Company are erecting a 40x150 foot garage with concrete floor.

Baltimore, Md.—The Automobile Outing Company have erected a garage and showroom on Charles and St. Paul streets. The building is of ornamental design and is fireproof throughout.

Baltimore, Md.—The McMullen-George Automobile Company will open a garage and repair shop at 542 Tyson street. They are agents for the Stearns cars.

Binghamton, N. Y.—Upon the completion of the new Whipple building that is being erected by R. W. Whipple, of the Binghamton Automobile Company, a salesroom and thoroughly equipped repair shop for Packard cars will be established here. The establishment will be similar in most respects to the Packard branches in other large cities.

Boston, Mass.—W. L. Russell & Co., who have the agency for the Apperson cars, have opened salesrooms at 169 Huntington avenue.

Buffalo, N. Y.—A fire in the garage of William J. Conners, at 723 Delaware avenue, destroyed three automobiles and damaged a fourth, causing an automobile loss of \$12,000 and a garage loss of \$3,000. The cars were insured for \$17,500 and the garage for \$5,000.

Buffalo, N. Y.—John Lehman is to build a 30x60 feet brick garage at 40 West Seneca street, at a cost of \$3,000.

Buffalo, N. Y.—C. S. A. Coe has broken ground for the erection of an addition to the public garage at 44 Leroy avenue, to cost \$3,000.

Cherokee, Okla.—Van Lee Hood has the contract for the erection of a 25x100 feet brick garage on the lot next to the Frey building.

Cherokee, Okla.—The Fisher Automobile Company are building a \$5,000 garage. They will handle several lines of cars.

Cincinnati, Ohio.—A Ford branch is being opened in this city by Louis C. Block, manager of the Philadelphia Ford branch, who will also be in charge of the branch

Cleveland, Ohio.—The Baker Motor Vehicle Company will establish city salesrooms and a garage in the building now in course of erection at the corner of Euclid avenue and East Seventeenth street.

Columbus, Ohio.—Roy Patterson, a former newspaper man of Newark, Ohio, has purchased the garage business formerly conducted at 121 South Third street, by F. H. Lawell. Mr. Lawell is the leading spirit in the Franklin Motor Car Company, organized to handle the Franklin and Reo, in a different location. Mr. Patterson has taken charge of the business and is conducting a repair shop and renting agency.

Dallas, Tex.—The Ford Motor Company have closed a five years' lease for a two story stone building in course of construction at 443-45 Commerce street, which will be completed by January I.

Dallas, Tex.—The Holcker-Elberg Company, of Kansas City, Mo., will establish a branch here. A three story brick building will be erected on Commerce street, between Pearl and Harwood streets, which will be supplied with electric elevators and all modern improvements. The cost will be about \$15,000.

Detroit, Mich.—A 60x200 feet garage is to be erected for the Security Auto Company on Woodward avenue, near Warren street, to be ready for occupancy February 15. The principals of the firm are John A. Sibley and W. J. Casterton. They will handle the Everitt "30." The company have opened temporary quarters at 872 Woodward avenue.

Detroit, Mich.—The Packard Motor Car Company are erecting another addition to their plant, on the Boulevard, between Concord and the railroad. The building will be five stories, of reinforced concrete, and will cost \$65,000.

Flandreau, S. Dak.—H. O. Ekern and Fred Gulzow will conduct a garage in the Will Rowe livery building.

Garretson, S. Dak.—Lyman Bowen, of Beaver Creek Township, Minn., has bought a Ford touring car to use in connection with the livery stable and garage he will conduct here.

Green Bay, Wis.—Malchow & Zimmerman, of Oskosh, Wis., who recently purchased the automobile department conducted by the Gottfredson Brothers Company, wholesale hardware, have reopened the garage under the title of Green Bay Motor Car Company. The Gottfredson garage has been entirely remodeled and a repair shop and accessory department added.

Green Bay, Wis.—"The West Side Garage" is the name of a new concern established by Louis Indra and Carl Jones. They will handle agencies, do a livery business and make specialties of tire repairs and vulcanizing. Mr. Jones has been manager

of a large garage at Oshkosh for eight years.

Harrisburg, Pa.—The Houston Launch Club broke ground last week for the erection of a garage to accommodate the cars of its week-end members.

Hillsborough, N. H.—S. H. Baker is erecting a public garage.

Houston, Tex.—The Houston Motor Car Company have found it necessary to again enlarge their charging plant for recharging electric cars. They have the agency for the Columbia electrics.

Houston, Tex.—The Parmele-Wroe Automobile Company have taken temporary quarters in the old church on the corner of Capitol and Caroline streets, while awaiting the completion of a new building uptown.

Indianapolis, Ind.—The Reliable Auto Exchange, which was organized some time ago, has just leased the building at 820 East Washington street. It is a three story brick, fireproof structure and said to be well adapted to automobile business purposes. A garage and sales business will be conducted. The company is capitalized at \$25,000, with John A. George, Roy C. Shaneberger and Oliver F. Shaw as the owners.

Kansas City, Mo.—The Hollister Motor Car Company, of 624 East Fifteenth street, have moved to more commodious quarters at 1708-10 Grand avenue. They conduct an agency for the Great Smith

Kansas City, Mo.—The Midland Motor Car Company, who handle the Peerless, Chalmers-Detroit and Hudson, have opened new headquarters at 1523-25 Grand avenue, where they have 30,000 square feet of floor space in a two story building.

Madison, Wis.—The new garage being erected for George H. Pregler, West Johnson street, near Henry, will be ready for occupancy soon. It is a two story building, 60x100 feet, with a large basement for repair shop. A turntable and electric hoists are features of the equipment.

Melrose Park, Pa.—Herman Buchborn has invited bids for the erection of a two story stone garage on his property.

Milwaukee, Wis.—Patrick Cudahy, a wealthy meat packer, sustained a loss of \$15.000 when his private garage was destroyed by fire. Two cars, an electric and a gasoline automobile, were ruined. The fire is believed to have been caused by defective wiring in an electric recharging board.

Milwaukee, Wis.—The Bland-Mueller Auto Company, Fourth and Poplar streets, has been merged with the Franklin Automobile Company, recently incorporated to handle the Franklin in Wisconsin. The new concern will have one of the largest tire repair plants in the Northwest, besides a large general repair shop and accessory department.

Newark, N. J.—Adrian Riker has given the contract for the erection of a two thory \$7.000 garage.

New York, N. Y.—Dorman L. Ormsby has taken a lease on a one story garage now in course of construction on 151st street, east of Amsterdam avenue. The building will be 50x100 feet and will cost \$10.000.

Norristown, Pa.—Eli Cassel has purchased the property adjoining his wheel shop, upon which he will erect a modern garage with a frontage of 125 feet.

Philadelphia, Pa.—P. J. McGarvey has let the contract for the erection of a two story garage at 1229-33 Belmont avenue, at an estimated cost of \$15,000.

Philadelphia, Pa.—The Chalmers-Fanning Company has been dissolved and has been succeeded by the Chalmers Motor Company, composed of Hugh Chalmers and George W. Hipple. Mr. Hipple is also a member of the Levy-Hipple Motor Company, of Chicago. Mr. Chalmers is the president of the new concern, which occupies spacious quarters at Broad and Vine streets, handling the Chalmers-Detroit.

Philadelphia, Pa.—The Hoopes Motor Company has been organized here by Henry R. Hoopes, formerly of the Crawford Automobile Company, to handle the Rambler. The new concern takes over all of the assets of the Crawford Company and will occupy the quarters of the former company at Broad street and Fairmount avenue, which have been completely remodeled. Mr. Hoopes will continue to handle the Crawford.

Pittsburg, Pa.—The Park Garage, on West Ohio street, has passed into new hands, and the new management will put the garage and machine shop in first class condition.

Pittsburg, Pa.—The Premier Sales Company, Ltd., agents for Premier and Reo cars, moved into their new quarters on Beatty and Mignonette streets, one block south of Pennsylvania avenue.

Portland, Ore.—M. B. Duffield has purchased the interest of Cuthbert & Smithson and will hereafter handle the Hupmobile cars here.

Reading, Pa.—Elias R. H. Holtzman has purchased the Blimline property and will open a garage.

Rochester, N. Y.—The Gillis-Strick-land Motor Company have applied to Fire Marshal Pierce for a permit to build a one story 33x203 garage on Clinton avenue South, at an estimated cost of \$9,600.

St. Charles, III.—A contract for the new E. J. Hahn garage building, to be erected on the present site of the Hahn shop in West Second street, has been let.

Sheboygan, Wis.—A. G. Maurer formally opened his new garage on Niagara avenue last week.

Syracuse, N. Y.—The Franklin Automobile Company have leased the Crosby garage at Montgomery and Water streets, which they will equip with modern machinery to be operated by electric power. There will be an elevator and every convenience for handling second hand cars, which they intend to display in connection

with the repair shop. A new show room will be erected later.

Tacoma, Wash.—The Winton Motor Car Company have established a salesroom at 705 Pacific avenue. Messrs. Detweller & Rushmore are the Tacoma agents.

Utica, N. Y.—An injunction restraining Harry M. Levengston, of Saratoga Springs, from erecting a garage at the corner of Plant and Hart streets, this city, was granted last week by County Judge Pritchard, on motion of R. R. Martin, attorney for Richard W. Sherman, who resides near the location of the proposed garage. Mr. Sherman contended that the continual chugchug of automobiles day and night would be an intolerable nuisance in the residential district. He also asks that the restraining order be made permanent.

Vergennes, Vt.—W. H. & W. S. Bristol are soon to open a garage and repair shop under the management of G. E. Glaser, of Buffalo. N. Y.

Waterford, Wis.—Hamm Brothers will open a garage and agency in the Moe Building as soon as improvements are completed. Both are expert machinists and will make a specialty of repair work.

Waynesburg, Pa.—The Hoover Automobile Company are now installed in their new two story brick garage on South Morgan and High streets. The building is 60x72 feet with cement floors and is absolutely fireproof. The first floor is used for offices and repair shop, and the upper floor for storage.

W. Burke, Vt.—A. C. Griffin has built a garage near the hotel.

Wilkes-Barre, Pa.—The Lehigh and Wilkes-Barre Coal Company was awarded a building permit for the construction of a garage on the company's grounds on South River street.

#### New Agencies.

TRENTON, N. J.—Driscoll & Twist, Hupmo-bile.

CANTON, MINN.—Dunford & Knudson, Buick.

MERIDEN, CONN.—Brown & Underwood, Stearns.

FINDLAY, OHIO.—Electric Construction Co., Speedwell.
COSHOCTON, OHIO.—S. Siegert & Sons.

Speedwell.
ATLANTA, GA.—The National Motor Sales

Co., National.

DULUTH, MINN.—The Russell Motor Co.,

Wilcox trucks.
ABERDEEN. S. DAK.—The Aberdeen Auto-

mobile Co., Franklin.

TOLEDO, OHIO.—Frank Hilt, Tenth and Madison streets, Speedwell.

CANTON, OHIO.—Canton Motor Car Co. 113 Fifth street, Speedwell. COLUMBUS, OHIO.—Kimmel Brothers, 170

COLUMBUS, OHIO.—Kimmel Brothers, 170
North Fourth street, Speedwell.

HAMILTON, OHIO.—Central Motor Co., 26 North Second street, Speedwell.

CLEVELAND, OHIO.—Park Motor Car Ca.
1021-5 Superior street, Speedwell.

ST. JAMES, MINN.—The St. James Automobile Co., Ford, Buick and Brush cars.

CINCINNATI, OHIO.—The Speedwell Motor Car Co., 228 East Sixth street, Speedwell.

ST. JOSEPH, MO.—The Wells-Farmer Antomobile Co., corner of Thirteenth street and Frederick avenue, Ford, Rambler and Maxwell.

### NOTES OF THE INDUSTRY AND THE SPORT.

The Cadillac Motor Car Company inform us that their average output for this season will be very close to 900 cars per month.

The Howard Rim Company, of Trenton, N. J., have opened a sales office in Philadelphia at 1411 Race street, in charge of H. T. Eisenberg.

H. T. Alexander & Co., 17 State street, New York, who formerly used the trade name Panhard for their lubricating oils, have adopted the name "Speedway" instead.

The Nielsen Motor Car Company has been incorporated in Detroit with a capital stock of \$50,000. The company controls two patents relating to automobile parts.

The Greyhound Motor Works, of 1443 Niagara street, Buffalo, N. Y., manufacturers of motorcycles, have acquired the plant formerly occupied by the Auto-Bi Company.

The K-W Ignition Company, of Cleveland, Ohio, announce the receipt of an order for 500 of their magnetos from the Ferro Machine and Foundry Company, of the same city.

The Watt Motor Car Company has been formed in Detroit, by F. J. Watt, of the Watt-Detroit Carburetor Company, to manufacture a six cylinder car, and are considering the building of a factory.

The Detroit Magneto Company, whose incorporation was announced in our last week's issue, have taken over the business of the Struther Magneto Company, and are located at 11-23 Raynor street, Detroit.

A retreading pot in the vulcanizing plant of the Wisconsin Tire Repair Company, 168 Main street, Oshkosh, Wis., exploded last week, causing \$500 to \$1,000 damage. No one was injured. Repairs have already been made and there was no interruption.

F. C. and Edwin Vandewater, who have been manufacturing the Correjacar in a small way in Iselin, near Rahway, N. J., for several years, have removed to Elizabeth, N. J., where they have secured the Heidritter Building, on Prince street, which contains about 40,000 square feet of floor space.

A building now occupied as a repair shop by the Buick Motor Company, has been purchased by the Prest-O-Lite Company in Indianapolis. The latter expects to use the building as a warehouse, after making extensive improvements. It is 44x195 feet and is located at Henry and Alabama streets.

A fire occurred at the Boston Gear Works, Norfolk Downs, Mass., on November 27, which partly destroyed the plant, but about 75 per cent. of the tool equipment was saved and the firm were partially running again in two days after the fire. They hope to be doing their regular work

again in six to ten days from the fire, and inform us that they are not cancelling the majority of their orders.

Ralph Rogers, who formerly built a high wheel car in Chicago, has formed the Rogers Motor Car Company, which will locate in Ralston, Neb., a suburb of Omaha. Five local business men are interested in the new company, including the Ralston brothers, who conduct a garage in Omaha. It is expected to have the first cars out by next spring.

The Firestone Tire and Rubber Company, of Akron, Ohio, have established agencies for their tires and demountable rims with Whitaker Tire and Rubber Company, 121 Union street, Memphis, Tenn.; Central Automobile Company, Vancouver, British Columbia, and Harris Tire Company, corner Perry and Drayton streets, Savannah, Ga.

George P. Hewitt, 509 Matthews building, Milwaukee, Wis., a Buick representative in Wisconsin, is advertising for skilled mechanics on behalf of the Buick Motor Car Company, of Flint, Mich. The demand for all kinds of labor is so strong in Milwaukee and the suburbs, however, that it is practically impossible to procure men for outside industries.

The Falls Machine Company, of Sheboygan, Wis., is installing several large machine tools and grinding equipment in order to take care of an order for 1,000 motors from a Detroit automobile factory. The company has been building automobile engines for some years, but this order is the largest it has ever received. It may be necessary to build several additions.

The first prize offered by the New York Herald in connection with the recent New York-Atlanta tour has been awarded to Mercer County, New Jersey, the best stretch of road north of Roanoke, Va., having been encountered in that county. The second prize, of \$500, was awarded to Jefferson County, West Virginia, and the third prize, of \$250, to Rockbridge County, Virginia.

The Fisk Rubber Company, of Chicopee Falls, Mass., have concluded arrangements with an anti-skid chain manufacturer for the manufacture of a chain which is anchored neither to the tire, nor rim, the tread cross pieces being longer than the usual type, so that they cover a large surface of the tire, whereby damage to the tires is claimed to be avoided. This chain will be handled by the Fisk Company.

The Racine Manufacturing Company, of Racine, Wis., are adding new buildings to their plant for the manufacture of automobile bodies, limousines, taxicabs, coupés, touring bodies, dashes, and battery and tool containers. The force of employees will be increased to 1,650. The company now owns nine buildings, covering eleven acres.

Eight buildings are four stories high and the ninth is six stories high.

The Moon Motor Car Company, of St. Louis, Mo., have received from C. M. Garland, professor of engineering at the University of Illinois, a dynamometer for testing the motors of the company. A similar dynamometer is said to be in use in the engineering school at Cornell University.

The Standard Automobile Company of America plan to remove from St. Louis to Wabash, Ind. The Wabash Exchange is selling a number of lots in the Fairview addition for the purpose of raising the money necessary to secure the factory. The company will turn out a car costing \$2,000, for which they claim to have orders for 400.

E. M. Clark and C. B. Richardson, of Philadelphia, are endeavoring to interest capitalists of Owosso, Mich., in a factory for light motor trucks and delivery wagons, to be located in that city. A meeting was held at the Owosso Improvement Association on December 1 to consider the proposition.

The Western Motor Works, which established a branch factory in Marion, Ind., nearly a year ago, have made their first report to the Marion Chamber of Commerce, in accordance with a contract with the latter. During the past half year an average of eighty men have been employed and at the present time ninety-five are on the pay roll, according to this report.

#### Club Notes.

The Oklahoma A. A. will give its annual banquet in the hall of the Chamber of Commerce in Oklahoma City about December 10. The association is fostering a license law providing for a license fee of \$5 per vehicle per year, the revenue from which is to go into the State road fund.

The Denver Motor Club advertises in the local papers offering a reward of \$100 for the conviction of anyone using a machine belonging to any member of the club without the owner's permission. The club is also on the lookout for petty thieves who steal tools, lamps, robes, etc., from automobiles.

The Long Island A. C. held its annual meeting at the clubhouse at 920 Union street, Brooklyn, on December 1. During the past year 294 names were added to the list of members, an increase of 62 per cent. Allen C. Alderman won the prize for having brought in the largest number of new members in 1908, and again won the trophy for 1909. The mileage cup was won by William C. Bolton, who covered 11,150 miles during the season. The following officers yere elected: Allen C. Alderman, president; Louis T. Weiss, vice president;

C. S. Cavanagh, secretary, and Chas. C. Cluff, treasurer.

The Quaker City Motor Club has sent an invitation to Governor Stuart, of Pennsylvania, to attend its second annual banquet on January 6

The A. A. A. has secured additional room in the building at 437 Fifth avenue, New York, where its headquarters are located. The contest board, the touring information board and the editorial offices of the association's monthly publication will be located there.

The Denver Motor Club is planning the following events for the coming year: Two road races, one on Decoration Day and the other on Labor Day; a reliability contest in June; a gasoline economy contest in October, and a hill climbing contest in November.

The Will County (Ill.) Automobile and Good Roads Association was organized at a meeting held at the Commercial Club in Joliet, Ill., on November 26, with Sebastian Lagger as president. The association will inaugurate an active campaign in the interest of good roads in the county.

The Minneapolis A. C. has adopted a resolution requesting the city to repair University avenue, between Nineteenth avenue Southeast and Twenty-fifth avenue, and has indorsed the completion of the paving on Lyndale avenue, Crystal Lake avenue, Hiawatha avenue and Thirty-fourth street.

The Chenango County Motor Association was organized at a meeting held at the garage of the Norwich (N. Y.) Motor and Machine Company on November 29. The following officers were elected: Henry R. Follett, president; Frank S. Powell, vice president; H. Gilbert Mahan, treasurer, and Charles H. Latham, secretary.

The Colorado Springs A. C. has started a campaign to raise \$5,000 for the completion of the new road from the Springs to Cañon City. The funds set aside for the purpose by the Legislature have been exhausted, and in order to keep the convicts at work on the road until the Legislature meets again and can appropriate further sums the above amount will be necessary.

The Minneapolis A. C. has posted notice that it will give a reward of \$50 for any information leading to the arrest and conviction of any person unlawfully taking, stealing or tampering with any automobile within the city of Minneapolis. This action, which was decided upon by the trustees at a meeting held on November 30, is directed at the practice of "joy riding" which is said to be very prevalent in the city.

The Buffalo Motorcycle Club held another meeting Wednesday evening, December 1. The total membership has increased to 127 members. The nominations for officers for the coming year were accepted. William Mevius' design for pin and emblem was accepted. The colors of the club are to be pearl gray and maroon. Albert Johnhale was appointed captain for the coming season. All persons becoming

members of the club before January 1, 1910, will be considered charter members

The winter social season of the New Jersey Automobile and Motor Club was opened on December 2, with a smoker and vaudeville entertainment at the clubhouse, Park place, Newark.

### New Incorporations.

The Speedwell Motor Car Agency Company, Cincinnati, Ohio.—Capital stock, \$7,500.

The Raleigh Motor Car Company, Charlotte, N. C.—Capital stock, \$25,000. Incorporators, Dr. A. W. Goodwin and others.

The High Point Auto Sales Company, High Point, N. C.—Capital stock, \$50,000. Incorporators, H. A. White and A. M. Briggs.

Columbus Auto-Electrical Company, Columbus, Miss.—Capital stock, \$10,000. Incorporators, W. W. Garth, D. A. Hunt and others.

The Mitchell Automobile Company, Madison, Wis.—Capital stock, \$20,000. Incorporators, A. Bonnell, of Milwaukee, and others.

The Omaha Automobile Show Association, Omaha, Neb.—Capital stock, \$2,500. Incorporators, R. R. Kimball, J. J. Deright and J. L. Steward.

The Communipaw Motor Car Company, Jersey City, N. J.—Capital stock, \$10,000. Incorporators, John Nelson, William J. McIntyre and Ida N. Nelson.

The Chicago Auto Top Company, Chicago, Ill.—Capital stock, \$5,000. Incorporators, A. L. Scharpe, Albert Horat and Isaac Anderson Loeb.

The Citizens' Automobile Company, Indianapolis, Ind.—Capital stock, \$1,000. Incorporators, McDonald Purcell, Samuel D. Pierson and William H. Stafford.

The Lowell Auto Body Company, Grand Rapids, Mich.—Capital stock, \$30,000. Incorporators, Albertus H. Peckham, H. Algernon Peckham and Robert J. Flanagan.

Webb Motor Fire Apparatus Company, St. Louis, Mo.—Capital stock, \$300,000. Incorporators, A. C. Webb, D. B. Blossom Frank R. Tate, John O. Glanville and H. W. Femmer.

The Carpenter Motor-Vehicle Company, Brooklyn, N. Y.—Capital stock, \$10,000. Incorporators, H. L. Carpenter, Henry R. Price, J. N. Carpenter, James P. Lough and C. D. Wood, Jr.

The Demotcar Company of New Jersey, Trenton, N. J.—Capital stock, \$1,000,000. Incorporators, Frank T. Lodge, Stanton Clarke and John G. Krieg, all of Detroit, and John A. Hartpence, of Trenton.

The Jenkins Emergency Wheel Company, Richmond, Va.—Capital stock, \$40,000. Incorporators, Felix Keegan, W. F. Jenkins, John C. Hagan, John J. Blake, L. L. Kelley, J. N. Brenaman and E. Donahue.

The Atlanta Motor Car Company, Atlanta, Ga.—Capital stock, \$250,000. Incorporators, Dr. N. P. Moss, of Fayetteville, La.; J. N. Roussel, F. L. Sawyer, Craw-

ford Wheatley, W. P. Mills, George P. Petty and Arthur Bussey.

The Invincible Storage Battery Company, Chicago, Ill.—Capital stock, \$5,000.

The Motor Company of Salt Lake, Salt Lake City, Utah.—Capital stock, \$50,000. Incorporators, A. E. White, M. H. Kriebel and E. G. Palmer.

Barnett Automobile Tire Company, New Rochelle, N. Y.—Capital stock, \$80,000. Incorporators, Frank A. Barnett, P. W. Barnett and P. J. Leahon.

The Motor Company, Salt Lake City, Utah.—Capital stock, \$50,000. Incorporators, A. F. Savage, A. E. White, M. H. Kriebel and E. G. Palmer.

The Dellamore Motor Car Company, Los Angeles, Cal.—Capital stock, \$25,000. Incorporators, A. Dellamore, E. M. Dellamore and William Dellamore.

The Beyster-Detroit Motor Company, Detroit, Mich.—Capital stock, \$50,000. Incorporators, Henry E. Beyster, Benson E. Brown and Herbert C. Munro.

The Detroit Magneto Company, Detroit, Mich.—Capital stock, \$100.000. Incorporators, F. G. Baillie, M. Fletcher, E. M. Tyler, John A. Lotz and A. A. Fletcher.

The Southern Motor Sales Company, Louisville, Ky.—Capital stock, \$10,000 Incorporators, W. F. Blackford, A. L. Martin, George H. Bohannon and C. C. English.

The M. & M. Company, Cleveland, Ohio.

—To deal in automobile parts; capital stock.

\$15,000. Incorporators, C. S. Machner, R.

A. Wilbur, J. C. McLean, A. S. Dole and

F. B. Graham.

The Overland Motor Company, Boston. Mass.—Capital stock, \$25,000. Incorporators. Charles G. Andrews, of Everett; George A. Patten and Manley A. Jackson, of Chelsea, and James M. Linscott.

### Trade Personals.

O. P. Bernhart, vice president of the Croxton-Keeton Motor Company, Massillon, Ohio, is on a trip through the West in the interest of the company.

Wally Owen, the well known racing driver, has signed a contract with the Rainier Motor Company, and will sell Rainier cars from the Sixty-fourth street, New York, headquarters.

Paul N. Lineberger, vice president of the Rainier Motor Company, has just returned from a trip through the South, on which he appointed State agents for the Rainier car in Georgia and Alabama.

George L. Crook, formerly general superintendent of the Fairbanks-Morse Company, at Beloit, Wis., later of the International Harvester Company, as general manager of the gas engine plant at Milwaukee, and recently in charge of the manufacturing organization in the E.-M.-F. plant at Detroit, Mich., has entered the employ of the M. Rumely Company, manufacturers of motor tractors and agricultural machinery at La Porte, Ind., as works manager.

# The Horseless Age

First Automobile Journal in the English Language

UME XXIV

NEW YORK, DECEMBER 15, 1909

NUMBER 24

# Irregularities in the Motions of Transmission Members.

By S. Gerster.

gularities in the motions of transon members are due to irregularithe speed of the motor, to variain the position of the driving axle espect to the frame, and to the arment of the linkage between the and axle. The accelerations and rations of the motor are not of

importance as vent the properation of the ete mechanism. Her the motored with a govor not the es in speed are s gradual and the controled driver.

irregularities the arrangeof the transon members are imes quite and appreci-They are due balancing of body on the and the and have a bad on the durabilthe parts. Two of irregulariust be consideparately, viz.: Those due to niversal joint. Those due to ertical play of riving axle.

irregularities to the univeroint are the or the more the lier shaft is ed. When only agle universal is used it is

sible to eliminate this irregularity.

1-8 illustrate an apparatus which instrates in what manner it is possion obviate this defect by means of e universal joints. Figs. 1-4 show pparatus with the two forks on the ller shaft perpendicular to each

In Fig. 2 it will be seen that the ndicator hands are at the vertical

division; for one-eighth of a revolution of the driving indicator hand (Fig. 3) the driven hand has advanced more than 45 degrees, but after a quarter turn of the driving hand the driven hand is again in line with it, both being horizontal (Fig. 4).

During the first of the eight periods

where  $\omega$  is the velocity of the driven shaft and  $\alpha$  the angle of the propeller shaft with the horozintal.

Figs. 5-8 show the apparatus with the forks of the propeller shaft in the same plane, in which case the periodical errors of the two joints compensate each other. Fig. 7 shows the two indicating hands at

45 degrees, and they both move at equal velocity at every instant. In order to secure even driving it is therefore necessary to key the two universal joint forks at the opposite ends of the propeller shaft so that they are in the same plane.

The irregularities due to the motion of the axle with relation to the chassis frame are smaller or greater according to the general arrangement of the drive. As the driving axle approaches to the frame and recedes from it, the driving shaft is accelerated or retarded in speed. This variation is greater the more the axle is displaced, and the more rapid its displacement the greater the strain on the parts.

In order to make a thorough study of the speed variations with the different arrangements of linkages, the writer had

made scale models of the different types of vehicles in use. In all of these models the distance between the change gear box and the rear axle is substantially the same. The models were constructed for a spring play of 6 inches.

Figs. 9 and 10 show a model of a chain driven car. The first figure shows the model in the normal position, and the

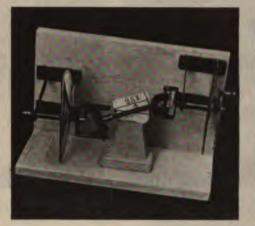

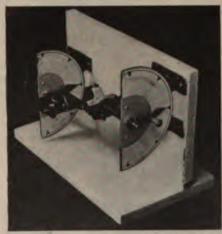

Fig. 1.

Fig. 2.

F1G. 3

F15. 4.

the driven shaft is accelerated; during the second and third it is retarded, and during the fourth it is accelerated; the same applies to the fifth, sixth, seventh and eighth periods. The maximum angular velocity  $\omega$  of the driven shaft at any instant is given by the formula

$$\omega_1 = 2 \frac{\omega \times \cos \alpha}{1 - \sin^2 \omega \sin^2 \alpha}$$

VELIE REAR CONSTRUCTION SHOWING ACCESSIBILITY OF DIFFERENTIAL,

independently. A crank case compression relief and oil filler is located on the left front motor hanger arm.

The clutch is, as above stated, of the three dry type, with a slip square between it and the transmission, and a brake that works in unison with the pedal and stops the shaft from spinning, thus permitting the gears to be changed quietly. The slip square gives a universal action between the clutch and transmission, preventing the binding of transmission gears over rough and uneven roads.

The transmission is of the selective three speed type, with both shafts carried on Timken short series roller bearings. The gears are 3½ per cent, nickel steel, hardened and ground.

The propeller shaft between the transmission and rear axle is provided with two double universal joints of the cross and roller type, the transmission and drive pinion shaft ends being squared.

The rear axle is a Timken full floating type, with the differential casing and wheels carried on Timken roller bearings. The front axle is a drop forged I section Timken axle, with steering arms located behind and above the axle. The brakes work through equalizers on the rear wheel drums, and are internal expanding and external contracting, respectively, and operated in the usual manner. The front springs are semielliptic, 2 inches wide and 38 inches long; the rear springs are three-quarter scroll elliptic, 2 inches wide and 46 inches long. The wheel base is 115 inches, and a 34x4 inch quick detachanble tire equipment is furnished.

### Milwaukee Tool Grinder.

These tools have an iron case very accurately machined, and when assembled are oil tight, which protects the gears and bearings from the fine dust from the emery wheel and holds the oil, keeping the bearings lubricated and reducing the wear to a

minimum. The driven shaft that also carries the grinding wheel is supported at both sides of the driven pinion by liberal bearings. The driving gear is also supplied with two bearings, one on either side on

the crank shaft. At the lower part of the case are two projecting prongs which rest on a cable or bench, and below this is a thumb screw which sets up against the bottom and permits of quickly fastening or removing the grinder from any beach or

table. The gears are all accurately machined and mesh perfectly, thus causing them to run quietly and smoothly with very little friction. The ratio of the gears permits of very high speed of the grinding wheel, with low speed of the crank. The universal tool rest is claimed to be strong and simple, and can be set on either side of the wheel and adjusted to any angle or position desired. These grinders are made by the Garage Equipment Manufacturing Company, of Milwaukee, Wis.

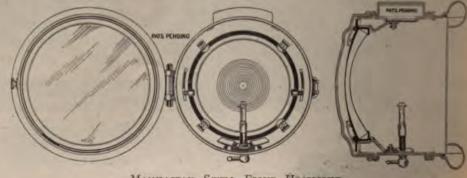

### Manhattan Swell Front Headlight.

We illustrate herewith the new swell front design of double metal headlight made by the Manhattan Screw and Stamping Works, West End avenue and Sixtyseventh street, New York city, for 1910. The lamp consists of two full shells, each supporting the other, and is claimed to be twice as strong as a single shell lamp. By rolling in the swell front to a smaller diameter than the body, the side shadows and side glare are said to be cut out. Great pains have been taken in the design to insure a clean lamp. The expanding collar permits of the use of a solid front glass. The flat flame burner is claimed to be impossible to choke, and it is also claimed that it will not crack the glass or the mirror. All bolt heads, screw heads and couplings are on the inner body, and the outside is therefore smooth and clean.

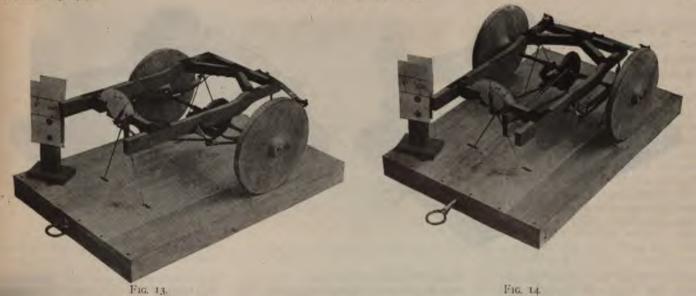

### Personnel of Owen Motor Car Company.

The Owen Motor Car Company, which, as announced in a recent issue of The Horseless Age, has been organized in Detroit by Ralph Owen and the Smith Brothers, who were formerly connected with the Olds Motor Works, of Lansing, Mich., will turn out a 52 horse power, long stroke car, to sell at \$3,200. The officers of the company are Edward Turnbull president, Angus Smith treasurer, and Ralph Owen general manager. The company have bought a nine acre plot on the boulevard on which there is a four story 60x150 foot factory building. It is planned to turn out 500 cars next year.

The space in the lobby of the Hotel Breslin, New York, will this year be occupied by a Premier during the Palace Show, and a Chalmers during the Garden Show.

MANHATTAN SWELL FRONT HEADLIGHT.

direct drive. The trained ear of the driver may hear and distinguish the noises resulting from play in the universal joints, in the driving gears or between the sliding members and their shafts. When the car is driven across a cross gutter, without the clutch being disengaged, a shock of short duration is produced, and the novice driver often wonders what may be the cause of this, without being able to satisfactorily explain the action. A well designed and well built change speed gear would withstand these shocks without producing any noise, even on a road in bad condition.

The writer has made some experiments with a change gear mounted with a linkage similar to that of Figs. 13 and 14. A noise was heard in the gearing, due to the unevennesses of the road. By discarding the linkage and adopting that shown in Figs. 17 and 18 this noise was entirely stopped, and the suspension of the frame was improved without changing the springs.

Fig. 19 shows the under side of the apparatus and the cords attached to the frame in order to insure absolutely vertical displacement in imitating the compression of the springs.

If we suppose that the motor runs ab-

solutely regularly, at each oscillation of the rear axle a torsional effect is produced in one direction or the other. When the axle moves away from the frame the motor is suddenly relieved of its load and tends to accelerate; as soon as the axle approaches the frame again the motor takes up its load again and is pulled down to its normal speed, and below if the axle approaches the frame more closely than its normal position. This latter case occurs when the rear wheels

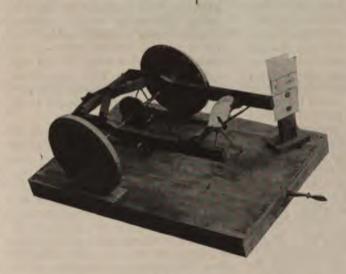

Fig. 12.

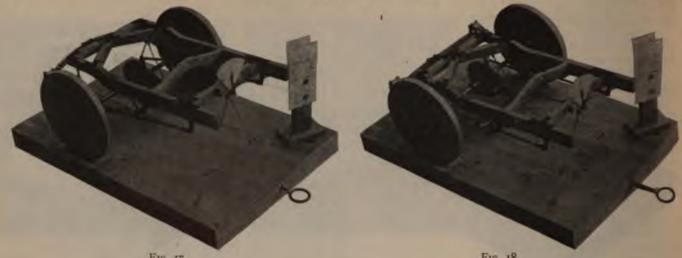

Fig. 17.

emerge from the cross gutter. order to obtain an accurate idea of the influence which the above described oscillations may have, the writer had constructed an apparatus which permits of correctly registering the time and the amplitude of these oscillations. This apparatus, Fig. 20, consists of a registering drum on which a needle traces a diagram. The rapidity with which this apparatus operates necessitates the adoption of some other driving system than a clock movement, as the irregularity of an escapement motion would be noticeable. A friction wheel movement would be inapplicable, as the vibrations would affect the speed of the drum. The writer found another means for operating the drum. The apparatus is driven from the front wheels of the vehicle by means of a roller engaging with a drum secured to the hub of the road wheel. In the illustration the driving friction wheel is seen in front of the apparatus. On the car the assembled apparatus is placed in front of the driver's seat. As each depression or prominence of the road produces an acceleration or retardation in

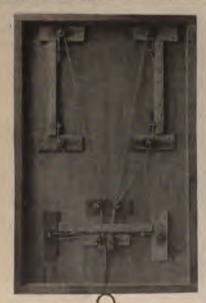

Fig. 19.

speed I introduced an elastic drive and a flywheel, which steadies the motion. The speed at which the diagram sheet is moved is calculated from the indication of the magnetic speedometer placed on top of the apparatus. The end of the registering arm is tensioned by means of a spring. Below the spring is attached the operating cord, which, passing over grooved pulleys, has its other end attached to the driving shaft. Things were so arranged that the draft was vertical above the axle. A step pulley gave a reduction of the scale to the height of the

The diagrams obtained show in the direction of their length the motions of the vehicle, and in the direction of their height the displacement of the axle relative to the frame. If we examine the diagrams, Figs. 21 and 22, we notice that there are undulations, vertical lines and even loops. The later are due to an imperfection in the apparatus, which cannot be taken into account. The vibrations affect the support of the drum, which gives rise to this effect.

Figs. 21 and 22 show diagrams taken in passing over a double cross gutter, represented by Fig. 23. The diagram, Fig. 21, was obtained at a speed of 21 miles per hour. The diagram, Fig. 22, was obtained under the same conditions, but at a speed of 30 miles per hour. By comparing the two diagrams it will be observed that the oscillations are produced at the same depressions and the same prominences of the ditch. They are the more pronounced, and the closer together the faster the vehicle is driven across. The vehicle requires less time to pass the obstacle in the second dia-

Fig. 23 gives the form of the cross gutter. The dotted line above the ground indicates the motion of the centre of gravity of that portion of the vehicle above the axle. The higher the speed of the vehicle the more this line will be accentuated.

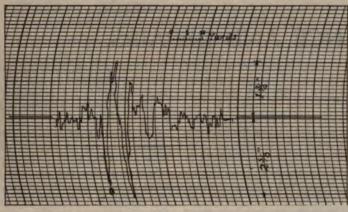

It remains to be shown in what way the oscillations which have thus been Fig. 18.

demonstrated to exist are detrimental. The vehicle with which the experiments were made weighed 1,790 pounds in front and 2,320 pounds in the rear. The motions of the axle in diagram Fig. 21 are not particularly dangerous, and we will therefore examine the oscillations of disgram Fig. 22. The greatest difference in speed is produced between the points A and B. At the point A the vehicle is in its highest position, the springs being extended to their maximum; at the point B. on the other hand, the vehicle is in its lowest position. The same letters are used to designate corresponding positions in Fig. 23. The line C-D indicates the normal height of the frame at rest; besides, it should be remarked that the curve of the diagram is above the line C-D when the motor is driving the car ahead. The curve is below the line for backward driving and braking. The motion of the axle is equal to 81/2 inches. which in the case of one of the first linkage systems above investigated corresponds to a rotation of the driving shift of 65 degrees.

The line A-B corresponds to a rota-

Fig. 20.

Speed, 21 M. P. H. = 10.4 yards P. S. The height of this diagram corresponds to 32.5 per cent, of the vertical motion of the axle.

tion in the direction of retardation of the motor. The time may be measured from the distance through which the car had progressed. In the case of our diagrams it is equal to one-sixth of a second. Let us investigate the importance of this figure. At 1,000 r. p. m. the motor shaft turns through an angle

a = 1000 × 360 = 360000° and for one-sixth of a second an angle of 360000 × 1 = 1000°

The driving shaft turns during the time represented by A-B (one-sixth second) through an angle of 1000 degrees at a constant speed. The motor of this same vehicle requires eight seconds to come to a stop, when running at no load, from the motion the ignition is cut off. The reduction of speed in degrees is there-

$$\frac{360 \times 1000}{60 \times 8} = 750^{\circ}$$
 per second,

 $\frac{750}{125} = 125^{\circ}$  for  $\frac{1}{2}$  second.

OF

The largest retardation in speed which

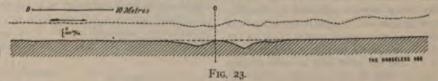

result is a shock to the vehicle in the

the motor may follow if its sustenance is cut off is therefore 125 degrees for onesixth second. The diminution in speed caused by the motion of the driving axle during the same period of time is 65 degrees. As the motor has a tendency to maintain its speed, it opposes a large resistance to this unexpected motion. The following moment. In the experiments the vehicle was running at 30 miles per hour. From a comparison of the two diagrams, Figs. 21 and 22, it is obvious that the oscillation of the axle increases with the speed at which the vehicle passes over the cross gutters. The distances of the peaks of the diagrams are the same, and are proportional to the distances passed through by the vehicle. The greater the speed the shorter the distances between peaks in relation to the time. Thus the writer

The motor readily follows its acceleration, which may be estimated at onequarter the acceleration of which it is capable when running free at this speed. This acceleration is very bad for the next

found that with a chain driven vehicle, as first described, it was impossible to cross a single ditch, 4 yards wide and 9 inches deep, without breaking the differential. There comes a moment when the propeller shaft stops, only to immediately resume its former speed. In one of the motor truck contests five differentials were broken on one truck in eight days.

The best method of eliminating these

forward direction. The transmission members take purchase on the mass of the flywheel on the one hand and on the ground and the mass of the vehicle on the other. The strain often becomes so great that the clutch slips. As soon as the point B is passed the axle moves upwardly and gives to the driving shaft a motion in the reverse direction, in the direction of rotation of the motor. The same motion was produced from O to A.

difficulties is to employ a linkage system, with which there is very little variation in speed. In addition to the most satisfactory systems above indicated, we may mention the double transverse Cardan shaft system of De Dion & Bouton, which produces an estimated error of not more than 3 degrees, which is due to the method of fastening the rear construction, the springs or the distance rods.

Some of the designers who became aware of these defects endeavored to overcome them by introducing into the drive (in the Cardan shaft, the driving connections to the wheels or in the universal joints) shock absorbing springs. The objection to these devices is that they are not strong enough at slow speed when the driving effort is very great, in which case they are compressed solid. For high speeds, when the torque transmitted is small, these springs are too stiff to give good results.

# MAINTENANCE AND REPAIRS.

### Battery Efficiency.

BY JAMES S. MADISON.

After experimenting for a period covering eighteen months for the purpose of determining the best conditions for yielding high battery efficiency in automobile ignition, the writer has obtained results that are very satisfactory.

The experiments were conducted with dry cells in an automobile of the runabout type, largely for the reason that this type is a popular one, and that comparatively few of them are equipped with storage batteries or magnetos. The car selected for observation has a 14-16 horse power, two cylinder, four cycle engine, with a non-vibrating coil. The spark is formed by a "make and break" timer actuated by the cam shaft. When the two iridium "points" of the timer are brought into contact by the revolution of the shaft, the circuit being closed by such contact, the current passes. When the points are separated by the continued motion of the shaft the circuit is broken and the current ceases. One of the points is adjustable so that the opening between it and the other may be made greater or less, as may be desired. The shorter the distance between the two the longer the contact; the greater the distance the shorter the contact. If the contact be too brief the spark delivered to the cylinders will be too feeble to ignite the explosive mixture, or yield only an incomplete explosion. If the contact be too long, within comparatively wide limits, it will not affect the explosions, but it will consume a wasteful amount of current, and hence decrease the life of the cells. By a few simple trials it was discovered that the "points," as adjusted by the maker of the car, were too close, and that the battery consumption was entirely too great. The first set of four cells (each cell showing 0.6 volt and 20-25 amperes) gave a mileage of only 140! The ignition system of the car is shown herewith.

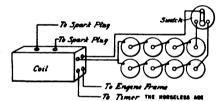

The arrangement was such that either battery, A or B, of four cells each, could be used, the advantage being that in case of a breakdown of one battery the other could be instantly used by moving the switch plug to the proper position.

### MILEAGE OF BATTERIES.

By this arrangement the mileage secured from four cells varied from 400 to 800 miles, the latter result being the highest that was obtained during the experiments. The average mileage was 600. It was possible to get this result only by observing carefully a number of precautions.

The method of procedure in installing a new set of cells was as follows: Originally a battery box was made that would just hold eight dry cells of the usual dimensions comfortably; it was provided with a par-

tition that divided it into two equal compartments. The bottom of the box is lined with two thicknesses of canton flannel. This makes a soft foundation that will absorb a great many shocks or jars that would otherwise reach the cells and aid in their deterioration. The space between each cell is firmly packed with clean dry waste. When it becomes desirable to replace the cells it is not necessary to remove the paper cylinders. The cells may be lifted out and the new ones slipped in without disturbing the packing. The box should always be kept in an upright position, so that each cell stands on its bottom, the position in which they are intended to stand. The cells are held firmly in this upright position by the flannel, the waste and a strip of wood, about 2 inches wide, that is secured by a single screw at each end of the top of the box. When a new set of cells is to be purchased each one is tested for its amperage, which should not be higher than 28 or lower than 15. The writer uses only one kind of cell, because the manufacturer of it is wise enough to stamp the date of its manufac-

ture on the bottom, thus protecting the consumer from stale cells. The brass carbon and zinc connections—each one of them—should be brightened with fine emery paper. It is important that the zinc connection should always be examined for the presence of pitch or sealing wax, which frequently becomes lodged there during the manufacture. When present it should be carefully removed. Further, each copper terminal should be polished with emery paper, and occasionally every terminal in the entire ignition system should be cleaned and polished. This will prevent much wasting of the current and a possible short circuit.

### MULTIPLE SERIES CONNECTION.

Having established the average number of miles a given set of cells connected in simple series would yield, it was decided to determine the effect of connecting the cells in series multiple. The method of carrying out the experiment was as follows: Eight new cells of the same make, showing by an ammeter 24 to 28 amperes, were placed in the battery box. The connections were changed as follows (see above figure): The wire ab conecting cell No. 8 and the coil was disconnected from the coil and attached to the zinc pole of cell No. 1. This pole now held the two wires ab and ef. The wire cd was disconnected from the switch

and connected to the carbon pole of cell No. 4. This pole now held the two wires cd and gh.

The effects were marked; the first one noticed was that the engine started more easily. But the most gratifying result obtained was that the car was driven for three months, with the exception of four days, without a single suggestion of anything like battery trouble. After the first day or two the question of battery trouble occupied a no more prominent place in the driver's mind than did the spokes of the wheels. It is a great comfort to the average owner to have at least one source of annovance eliminated. After running three months, the next day two missed explosions were noted. On the following day, after having driven 60 miles, the misses became more frequent and pronounced. The cells were then examined with an ammeter. Three of them read o; five of them 2. The mileage obtained was 1.756, a result nearly one and a half times better than the average obtained by using the same number of cells in simple series in two batteries. On this basis the cost of ignition per mile was a fraction over one mill.

### Italian Motor Truck Contest.

A national competition for motor trucks is being organized by the Italian Ministry of War, which plans to acquire 600 motor trucks at a total expenditure of 6,000.000 lire. In the announcement entries are requested of two types, one of 2,200 to 2,600 pounds useful load, and another of 4.400 to 5,500 pounds useful load. The trucks must be equipped with four cylinder vertical motors, capable of being operated with either gasoline or alcohol, be equipped with iron tires, four brakes and a front gasoline tank of a capacity sufficient for 125 miles. at an average of 9.5 miles per hour. The vehicles entered will be subjected to practical fuel economy and endurance tests, the strength of the material used in their construction will be determined by laboratory tests, and in addition the vehicles must take part in an uninterrupted run of 500 miles. Prizes to the amount of 20,000 lire will be awarded to competing manufacturers whose vehicles are not purchased at the conclusion of the trial, but who, nevertheless. are considered deserving of encouragement

The eighth international automobile show in Vienna, Austria, under the joint auspices of the Austrian A. C., the Austrian Automobile Manufacturers' Association and the Association of Austrian Automobile Dealers, will be held in the rotunda of the Prater from May to October, 1910, in connection with the first international hunting exhibition.

### Stresses in Shaft Drive Members.

A most interesting series of experiments is described in our leading article this week, by S. Gerster. It has relation to the stresses in the transmission members of chain and shaft driven cars due to the play of the chassis springs. It will be remembered that this subject was discussed theoretically in our columns by Mr. Gerster about a year ago. Some of the conclusions then reached were placed in doubt by one or two of our correspondents, and it was evidently with the intention of verifying the doubtful points that these experiments were undertaken.

So far as the experiments with the universal joints are concerned they do not demonstrate anything that is not already known to designers and engineers. The fluctuations in velocity due to the angularity of shafts connected by the ordinary types of universal joints are subject to exact calculation, and it is known that these fluctuations can be neutralized by

using two joints and placing the forks on the intermediate shaft in the same plane; it is further well known that the effects due to this cause can be minimized by making the propeller shaft as long as possible and so arranging the engine and gear box on the frame that when the car carries an average load the shafts connected by the universal joint or joints are substantially in a straight line.

The part of the experiments which covers a hitherto more or less unexplored field, at least as far as matter having appeared in the technical press enables one to judge, is that relating to motion of the drive members produced by the compression and rebound of the springs. In a perfect design there should be absolute independence between the spring action and the drive members, in which case the spring action would not be checked or hampered by the inertia of the drive members and the drive members would not be subjected to strains due to the inertia of the chassis and body. Mr. Gerster's experiments prove that when the vehicle body approaches the axle in passing over an obstacle the propeller shaft is rotated through a certain angle, if the rear wheels are considered stationary. In other words, there is relative motion between the propeller shaft and the rear axle shafts. With most of the systems of linkages ordinarily employed the propeller shaft is turned backward through a considerable angle when the chassis springs compress 6 inches. In regular running on the road this would mean that the engine would be slowed considerably. This rapid slowing of the engine is resisted by the inertia of the flywheel. Instead of the engine slowing the car might accelerate in its forward motion, but this acceleration is resisted by the inertia of the whole car.

We have, therefore, a triangular system of forces which at any moment balance each other—the vertical force due to the inertia of the spring supported body and frame, and the two turning efforts or torques due to the inertia of the flywheel and other rotating parts, and of the whole car in the forward direction, respectively. It is obvious that these forces impose great strains on all of the transmission members, and they explain the frequent breakages of differential gears and other parts of the drive on some heavy vehicles.

From the photographs accompanying Mr. Gerster's article it will be seen that of the systems experimented with two give almost ideal results in this respect. In one there

is no other connection between the rear axle and the frame than the semi-elliptic springs, which are hinged to the frame at their front end, at an equal distance from the rear axle as the forward universal joint. The other and most meritorious system (in this respect) of all comprises both a torsion rod and a pair of distance rods. The torsion rod is evidently hinged to a bracket extending from the rear axle housing vertically upward, and connects to a cross member of the frame at some distance to the rear of the forward universal joint. The distance rods are connected to the rear axle and to brackets depending from the side frames, about even with the forward universal joints.

As in this system both the rear axle torsion and the forward thrust are fully provided for, it seems to be the ideal system of rear axle linkage, and we commend it to the attention of automobile designers.

### The Torpedo Body.

From the reports of the Olympia show and the activity among American makers it is evident that the "torpedo body" will be one of the most popular new types during the coming season. For the past two years there has been a tendency away from the large tonneau, and while it is still a popular standard type and is sold in large numbers, bodies in which both front and rear seats are set rather low, and are of substantially the same height, have advanced in popularity. According to the style of construction these have been variously termed "baby tonneaus," "pony tonneaus," "roadsters," "surreys," "close coupled bodies," etc. Of these names the term "close coupled" is perhaps the most distinctive, for it is the bringing of the rear seat close to the front one which characterizes the

In most of the torpedo bodies the seat arrangement is much the same as in those just mentioned. Their special feature is that the foot spaces for both seats are closed by doors and that these doors are brought up nearly to the height of the dash and the seat backs. This enclosing of the foot space appears to be a very sensible feature, for it protects the occupants from dust and from cold winds and allows of comfortable driving without a lap robe much later in the season than is possible with more open types of bodies.

Quite a number of these bodies have considerable carrying space at the rear, large compartments being provided under and back of the rear seat. If not carried to extremes this would seem to be a move in the right direction, for up to the present time most body designers have given too little attention to the carrying of luggage.

The torpedo style of body appears to lend itself readily to unusual and extreme designs, so no doubt many "freakish" constructions will be produced along with numerous sensible models, but it would appear that the general effect of its introduction should be decidedly beneficial.

### The Economical Small Car.

Among recent improvements in the design of small four cylinder cars perhaps one of the most important is the general decrease in fuel consumption. The small car of the present day is far more economical than that of a few seasons ago. At the present time there are some makes of small cars which average not far from twenty-five miles per gallon of gasoline in the hands of the average user. While the economy records established in fuel consumption contests have been far better than this for some years past, the performance of the cars in the hands of the average owner has not been at all comparable with their possibilities, and recent advances have been along the lines of improving the average rather than the best economy.

The increased efficiency which we have just noted is probably due to three causes. The first and most direct cause is the improvement in carburetor design and charge distribution. Modern carburetors give a pretty economical mixture under a much wider range of operating conditions than those manufactured a short time ago. A good deal of attention has recently been paid to evaporating the fuel more completely than was formerly customary, and no doubt this has had its effect in increasing the economy. Charge distribution is much more uniform than it was in the older motors, and the resultant more even production of power has no doubt had its effect in reducing the fuel consumption.

Very likely a part of the increase in economy is due to improvements in ignition apparatus. In the hands of the average user, at least, the magneto seems to be the most reliable means for producing uniform rignition. The spark timing seems to be right a greater part of the time than with any other method and in consequence the parts of the motor function more nearly in synchronism when magneto ignition is

used. Correct timing and proper spark values aid in getting the maximum possible horse power hours from a given quantity of fuel, so no doubt the fuel economy with a magneto as the source of the ignition current averages better than where batteries are used, since the latter are often used to the point of exhaustion. Very likely some of the single spark systems may compare favorably with magnetos in this respect, but they have not been so commonly used on the smaller cars up to the present time.

Undoubtedly the third important reason for the decreased fuel consumption which we have mentioned is the improvement in mechanical efficiency. Driving gears are much more carefully cut and more correctly mounted than formerly. The same may be said of change gears, though it applies here perhaps in a lesser degree. There have been great improvements in the design and workmanship of some of the most popular anti-friction bearings recently, and they are now usually mounted so that they work to good advantage. In the engines themselves better workmanship is apparent throughout. Pistons and cylinders are more accurate, and the rings are more correctly fitted; valves are made of better material and their seats are more uniformly jacketed-all of which tends to reduce leakage and to conserve the fuel.

Wheels are larger, and in all probability tires are more efficient than a season or two ago. Most certainly springs are made of better material and are more correctly designed so that they hold the driving wheels in more uniform contact with the road. There is little doubt that the weight is distributed to better advantage, that skidding has been lessened, and that traction has become more effective.

In short, we may say that cars use less fuel because they are made better and their parts work more harmoniously.

# An Improvement in Storm Protection.

Most automobile owners have suffered the very unpleasant experience of having to attach the storm curtains upon the commencement of a sudden rainstorm while on the road. As the curtains are arranged to be secured to the outside of the top frame and bows, by means of a large number of fasteners, the person who attaches them must stand without the protection of the top and is almost certain to be thoroughly drenched before he has accomplished the work.

An ingenious and enterprising owner has departed from the long standing tradition of the carriage industry by devising a set of storm curtains which are attached to fasteners upon the inside of the framing of the top, and which can thus be put in place without the necessity of anyone's leaving the shelter of the top. The curtains are attached in front to the inside of the regular type of glass wind shield which meets the front of the top, no storm front of the regular type being used.

Unless there is some objection to this new arrangement, which is not apparent on the surface, it seems to possess decided merit from the common sense standpoint, and it will be interesting to note whether top makers will adopt the idea as a general practice.

Certain it is that, as ordinarily provided for, the attaching of the side curtains, in an emergency, usually results in at least one of the occupants of the car being put into that condition of wetness from which it is the function of the curtains to protect him.

### Quiet Cars Now Common.

Cars which are practically noiseless in operation have become common enough so that they do not attract the attention they did a few seasons ago. Indeed, a machine which is unusually noisy will not sell in this country at the present time, no matter what its merits may be.

While uniformity of workmanship and adjustment of parts are responsible for much of the reduction of noise proper, muffling of the engine is by far the most important cause. Good mufflers which break up the sound waves and do not rise from the vibrations of the exhaust are now common. Then, too, the work of the muffler is much less than formerly, for individual cylinders are smaller and there are more of them. Also, the exhausts from all the cylinders are nearly uniform, and hence are not apt to set up unpleasant pulsations. This is fully demonstrated by the fact that some cars can be run with the muffler cut-out open with scarcely audible exhaust when the throttle is nearly closed. This effect can only be produced with a carburetor working nicely and the ignition in perfect condition. And it is evident that when these conditions are realized the charges must be very small and uniform to produce a flow of exhaust gates which is free from the sharp puffs which make the exhaust noise unpleasant,

# The Commercial Vehicle Trials of the Automobile Club of France.

By P. Maisonneuve.

The serious setback experienced by the French automobile industry about two years ago had at least one happy counter effect for the commercial vehicle, which had until then been neglected by the manufacturers. As the sale of cars de luxe decreased the great factories were obliged to turn their attention in the direction of utility vehicles—light cars low in first cost and in up-keep on the one hand, and vehicles for the commercial transportation of passengers and goods on the other.

No time was to be lost in making up the lead gained by foreign manufacturers. At that time there already existed in England, the United States and Germany well built commercial vehicles for which there were plenty of purchasers in these countries, while in France these same vehicles were only very few in number, and they generally consisted of stock touring chasses slightly strengthened for the special purpose, and equipped with either an omnibus or a truck body.

As long as the manufacturers were fully occupied in supplying the demand for vehicles de luxe from wealthy clients they were not inclined to devote part of their energies and means of production to the construction of a type of vehicle the sale of which was certainly less remunerative than that of touring cars. The above explains why the French manufacturers of commercial vehicles in 1907 were outdistanced by their foreign competitors. At that time there was in France hardly a single firm which manufactured commercial vehicles exclusively, and, besides, as already stated, the

sale of these cars involved great difficul-

It should also be stated that French merchants and manufacturers have always been very reluctant to adopt motor propulsion. Consequently, when the French manufacturers built "heavy prospective customers whom premature trials with crude vehicles had rendered skeptical with regard to the future of automobile traffic in commercial enterprises.

In the subsequent development of the commercial vehicle in France no attempt

THREE PANHARDS ON THE ST. CYR ROAD.

weights" what they had to contend with most was not so much foreign compettion—there was not then, and there are not even now a half dozen commercial motor vehicles of foreign manufacture in use in French territory!—but the doubts and lack of enterprise of their

was made to introduce all the different types of commercial vehicles in existence elsewhere, notably the enormous vehicles of the locomotive type which are so extensively used in Great Britain. The only type of steam commercial vehicle which has held its own in France up to the present is the Purrey system, exploited in Bordeaux, in which coke is used as fuel. These vehicles, however, are far from being of the same weight and massive appearance as the English vehicles referred to above. Even the large "heavy weights," carrying from 5 to 6 tons, and which are of sufficient strength and rigidity, are of the general appearance of automobiles and not road locomotives; there are very few tractors with trailers in use.

The above observations concerning the status of the French commercial vehicle industry are of particular interest for the reason that during the past two years great progress has been made in this line. If even as late as last year the commercial vehicle was at a dangerous turn in its history, it may now be truly said that this critical point has been happily passed. This is the conclusion which may be drawn from the contest recently conducted by the Automobile Club of France, with the co-operation of the French Minister of War.

This contest, which lasted for a whole

VINOT AND DEGUINGAND TRUCK.

month, from October 15 to November 15, comprised twenty-four stages of an average length of 100, 120 and 150 kilometres, respectively, according to the class of the vehicles, which stages had to be covered at the average speeds indicated in following table, which contains also principal data regarding the contest:

ter of War were required to go through four stages in the form of a convoy, that is to say, by following one another at short distances, two of these stages being covered without load and two with

in limited number, and stamped before the start of the trial.

In case of magneto ignition-One magneto and chain if necessary.

In case of battery ignition-One coil and four cells of two volts each.

In case of magneto and coil ignition One magneto and one coil. In case of mag neto and battery ignition-One magnet and its chain or one coil and four cells o two volts each

One front spring and one rear spring; on set of brakes, one chain for chain drives ve hicles; one universal joint for shaft drive vehicles; one front and one rear shock a sorber. For steam vehicles, one comple burner and one boiler tube.

The replacement of other parts was for bidden, and entailed disqualification. Amon other parts, the same wheels and tires ha to be used throughout the trials.

A total of 57 vehicles started in the co test, of which 8 took part in the military contest only; 32 took part in this contest and in that of the Automobile Club of

SAURER TRUCK, WINNER OF CLASS IV.

sailles as starting and finishing point, and seven other stages, which together formed a closed circuit, the itinerary being as follows: Versailles, Montargis, Bourges, Montluçon, Clermont-Ferrand, Moulins, Cosmes, Pithiviers, Versailles. The total distance of the different stages amounted to 1,510, 1,850 and 2,245 miles, respectively, giving an average of 62.5, 75 and 94 miles per day for the different groups.

During the first thirteen stages the vehicles were supplied with gasoline, during the following five with an alcohol mixture, and during the remaining six with benzol. The object of this provision was to demonstrate that commercial vehicles may be operated with these different fuels, and particularly as well with alcohol and benzol-national products-as with gasoline-a foreign product. This is a matter of particular importance in connection with military transportation in times of war.

The vehicles which participated in the military competition for the award of special bonuses and of orders by the Minis-

were worked out according to the following formula:

$$\frac{T}{P}(C+C'+KP'),$$

in which T is the time in minutes; C, the cost of fuel consumed per kilometer in francs; C', the cost of the oil used during the entire run in francs per kilometer; K, a coefficient of tire maintenance in francs, which is equal to 0.005 for iron or steel tires, 0.015 for solid rubber tires and 0.03 for pneumatic tires. In the case of vehicles equipped with different forms of tires on the front and rear wheels, respectively, a combination tire cost figure was worked, based on the weight on each axle; P is the useful load in metric tons, including the body; P', the total weight of the vehicle in metric tons.

What added to the importance and value of the trials was the very strict limitation of the replacements permitted. Aside from spark plugs, valves, springs and parts of carburetors, which could be replaced at will, the following parts were not allowed to be replaced except by parts of the same nature

France, and 17 took part in the latter con test only. Owing to the fact that the results of the military contest have not yo been announced at the time of writing, w will only consider the vehicles which too part in the contest of the Austmobile On of which 29 out of 49 finished and we officially classed.

Owing to the severity of the contest, the many failures are not surprising; on t contrary, it is remarkable that so many v hicles finished the trials. On the who there were very few mechanical troob during the trials. The majority of the v hicles which withdrew from the compe tion suffered considerable delays which pr vented them from checking in on time the night controls. Among the serious m haps which caused some of the vehicles discontinue may be mentioned the seiri of the motor of a Panhard; collisions which incapacitated two Berliet cars and white were due to broken brakes, and a lun which carried a Malicet & Blin off of the road. Toward the end of the contest to Schneider vehicles, three Delaugere & Cla ette, another Panhard, a Cohendet and a D

suffered other mechanical troubles caused their disqualification.

No. 27. Saurer, first,

In the contest of small vehicles, under the auspices of L'Auto, which is being held December 5 to 19, thirty-three cars are taking part. The contest consists of daily stages of about 125 miles, which must be covered without mechanical breakdowns, at an average speed of at least 15.6 miles per hour.

Owing to the fact that the Grand Prix race will not be held next year, the Benz firm has abrogated its contract with Duray, the well known racing driver, who has been engaged by the Fiat firm to drive for them in the leading Italian race of the year. Benz & Cie. have, however, secured Scisc, who in 1907 won the Grand Prix in a Renault car.

DELAHAYE THREE TON TRUCK, WINNER IN CLASS V.

# GREAT QUESTIONS OF AUTOMOBILE ENGINEERING.

### Chain Drive versus Shaft Drive.

BY ALBERT L. CLOUGH.

The question of chain drive versus shaft drive possesses far less general interest than it did a few years ago, for the reason that among low and medium powered cars of modern design very few models are offered which employ chain driving. However, manufacturers of high powered machines have been rather reluctant to depart from the double chain method of final drive, quite a number still adhere to it, and some few give their customers their choice of chains or shaft when purchasing high powered models. In quite a number of instances a manufacturer produces a high powered chain driven model and a shaft driven model of lower horse power.

The use of the single chain drive upon late models is so restricted that comparatively little interest now attaches to it. The present discussion relates to the double chain drive.

### ADVANTAGES OF CHAIN DRIVE.

Among the arguments in favor of this method may be mentioned the following: That the use of double chains permits the employment of the simplest form of fixed or "dead" rear axle, differing not at all in principle from the common wagon axle. The axle is merely a solid forging of the I beam or other structurally advantageous form, and not a tubular construction with internal shafts, gears and their housings incorporated therewith. The rear wheels are simply journaled on the axle ends. This simple axle may readily be so formed that the rear wheels are given the degree of camber which carriage practice has shown to be desirable. Such an axle is of relatively light weight, since it can be made of a cross section which gives greatest strength per unit of weight; it has no differential and driving gears to carry at its weakest point-the centre-and does not have a portion of the weight of any driving shaft and housing to support. Not having any casing or enlarged portion at its centre, road clearance is not sacrificed.

The elimination from the axle of all metal other than that necessary to support the vehicle itself upon its wheels greatly reduces its dead weight and results in a decided reduction of the uncushioned shocks delivered to the tires. Since the axle is so light it possesses a relatively low inertia, and, at very high speeds, its wheels follow road irregularities better than the more massive shaft driven construction, thus conducing to better traction, less tire slip and better car control.

The somewhat delicate differential gear being eliminated from the axle, where it is subjected to shocks cushioned only by the tires, is housed in the change gear case, where it is spring supported and better protected from the hard treatment of the road surface. Since the axle has no tendency to turn under power, no torque rods are required and no driving stresses are imposed upon the springs, the only special attachments to the axle required being two simple distance rods.

It is further claimed that the variations of angular velocity between the transmission and the rear wheels, due to rear spring action, are less in the chain than in the shaft drive with single universal, and that, as the chains afford a much less rigid coupling between the gear box and the wheels than does the shaft drive, the evil effects due to this cause are much less pronounced, and also that this slightly vielding coupling has an influence in reducing tire wear due to That universal joints between the gear box and the rear axle, which are called upon to work through considerable angular movements, and which require considerable attention, are entirely dispensed with. That it is very much easier to change the gear ratio of a chain driven than a shaft driven car by simply putting on front sprockets of different size. That the chain drive very readily permits of a gear box arrangement affording two direct driven speeds, which can only be secured in the shaft drive arrangement in case the gear box be mounted upon the rear axle. That double chain driving permits a rearward location of the gear box, and thus favors better weight distribution than does the shaft drive system, for the jackshaft may itself be located well to the rear and the rest of the gear box may, if desired, be located to the rear of the

It is also pointed out that the chain is a very simple and rugged device, the links of which are detachable and interchangeable, so that it can be readily repaired, if necessary, upon the road without the use of special tools, and without disassembling any parts of the car, while a breakage of any part of the shaft driving system is reparable only in the shop and requires extensive disassembling and costly replacements.

The advocates of chain driving call attention to the fact that, by the use of chain cases, this method of final drive is accorded several advantages which it does not otherwise possess, namely: That the chains are as fully housed as are the parts of a shaft drive, dust is excluded and the chains wear very slowly, get out of pitch only after long periods of service, and retain for a long time their initial efficiency, which is at least as high as that of bevel gears. That the chain case permits of the maintenance of lubrication which greatly reduces wear, and that, if properly constructed, it confines what little noise is produced. That encasing permits the substitution for the naturally rather noisy roller chain of silent

chains of the Renold or Morse type, which are characterized by high transmission efficiency and low rate of wear, if protected from dirt.

DISADVANTAGES OF CHAIN DRIVE.

Among the disadvantages cited against chain driving may be mentioned the following: That it is a less direct method of final drive than is shaft driving when applied to the engine in front motor car, for a bevel pair is required in the gear box to change the direction of the drive from longitudinal to transverse of the car length. Thus when running on direct drive the motor of a chain driven car is transmitting through a berd pair a divided cross shaft, with two flexible joints and a pair of sprockets and chain on each side, while the motor of the shaft driven car is transmitting only through one or two universal joints, with their connecting shaft and a single bevel pair. It is contended that the more direct the transmission the more efficient it is, under similar conditions

That unless chain cases are employedand they are not yet in general use-it is impracticable to employ chains of the silent type, and that the drive is thus quite noisy and increasingly so as the chains wear out of pitch. That it is well nigh impossible effectually to lubricate exposed chains, and that hence wear is quite rapid; they lose their correct pitch, and besides becoming very noisy are likely to ride the sprockets. break themselves and cause damage to other parts. That the expense of chain renewals is decidedly large, even though frequent cleaning and lubrication are practiced at considerable expenditure of time and effort. That the chain operates inefficiently over rough roads, which cause one rear wheel at times to be lower or higher than the other, on account of the front and rear sprockets being thereby thrown out of the same plane, with the attendant friction of the sides of the links against the sides of the sprocket teeth. That the use of side chains unfavorably restricts the design of bodies of the side entrance type and require the ux of front sprocket guards.

### ADVANTAGES OF SHAFT DRIVE.

The argument for the shaft drive includes the following points: That it is essentially clean and requires very little attention, there being no exposed parts and all moving elements being constantly subject to effective lubrication. That it may be made almost completely silent and will remain so almost indefinitely. That by the use of two universal joints the variations in angular velocity between motor and wheels, due to spring action, may be reduced below that found in the chain drive, and thus less obnormal stresses will be thrown upon the change speed gears. That by the use of a yielding member, embodying springs located

somewhere in the power shaft line, the somewhat ameliorated rigidity of drive which the chain affords may be duplicated. That the shaft drive maintains for long periods of use its initial efficiency, on account of the effective enclosure and lubrication of the working parts. That it is the most direct method of coupling the gear box to the rear wheels, and calls for no extra parts in the gear box. That it is entirely under the car and does not hamper body design.

The critics of the shaft drive contend: That the live rear axle which its use entails is more complicated and less structurally desirable. That, except in some special designs, the axle proper must be of tubular section, which is not the most advantageous form for strength with minimum weight. That the differential gear is unnecessarily exposed to road shocks by being incorporated in the axle. (These objections apply to all live axles, however driven.)

It is contended, further, that in order to secure a nearly straight line drive the gear box has to be placed unduly far forward. which results in an unfavorable weight distribution, and that the large unsprung weight of the axle, shafts, differential gear, drive gears and their housings, and a part of the drive shaft and its casing, acts to unduly increase tire wear, and calls for heavy construction to insure a proper degree of rigidty. That the rigid driving effect which it affords is unnecessarily hard upon the tires, and that at high speed the shaft driven axle does not hold the road very well on account of its high inertia. (This objection applies mainly at racing speeds.) That, as the rear axle tends to turn under the reaction of the driving effort, either a system of torque rods must be employed or the rear springs must be made to perform the double function of springing the vehicle and resisting the torque reaction. That the employment of universal joints, which is a necessity in this system, is wasteful of power and the joints themselves are subject to wear and demand considerable attention, and that rear wheel camber cannot be provided for in the shaft drive system without resort to special construction.

# Public Vehicles in Berlin-The Horse Passing Before the Motor.

The increase in the number of motor taxicabs has led to a decrease in the total number of public vehicles in service in Berlin during the third quarter of the year, from 10,702 to 10,552. The number of cabs has dropped from 6,475 to 6,308. Of the horse cabs of the first class, 224 discontinued, so that on September 30 there remained only 5,070. Cabs of the second class are disappearing slowly but surely; there were 129 left on September 30 against 132 on June 30. The number of motor cabs increased from 873 to 938. The omnibus companies owned at the end of the third quarter 953 vehicles, as compared with 942, of which 173 were motor propelled, as compared with 166.

# The Retail Business in Atlanta. By Charles E. Duryea.

Hindsight is more accurate than foresight, and the best view of Atlanta's retail business had to be waited for till the show, the races, the parades and the daily newspaper talk had passed into history and the temporary fever had cooled down. Atlanta's people seem more than usually impulsive and seemed to respond to the spirit of the occasion more fully than do the colder blooded inhabitants of the North. The space devoted by the daily papers to exploiting the automobile was great, but the enthusiasm thrown into the work was greater and was matched by the "Atlanta spirit" of the people, who seemed determined to make up by their responsiveness what they lacked in numbers. As a result of this good roads are being made at a rapid rate, and automobiles have been purchased very liberally, while even those whose finances do not at present permit auto ownership look forward to the day when they will be able to afford this necessity

Nor was this feeling confined to Atlanta alone. It extended beyond the 300 miles of good roads in Fulton County and covered the whole State, even reaching the sands of Florida. Buyers flocked to Atlanta because of its prominence as a distributing point, and the auto dealers prospered accordingly. Others saw this prosperity and yearned to share it. The result was the opening of salesrooms and garages on every hand until in that city of 120,000 people, probably half of whom are colored, are to be found at least seventy-five dealers, representing more than 120 different makes of autos. When it is remembered that the colored people are not buyers, that the country is relatively new, and has not the accumulated wealth found in the North, and that the majority of the roads are still bottomless beds of sand or badly gullied clay hills, it will be seen that the outlook for a continuation of the profitable business of the past season is not good. And the agents are awakening to this. When closely questioned they express the opinion that they will be kept busy selling the cars they have contracted for. They realize that the market is being overworked.

Recognizing the fact thus early, they will do much to avoid a slump and the throwing of cars on the market at ruinous prices. But in any event the danger is great. And it is made greater by the fact that in their enthusiasm the practical use of the auto was largely overshadowed by the sporting use. Demonstrations were given on the best roads, models of road making, instead of on average or on inferior roads, where practical users must go more or less frequently. A large number of Atlanta's streets are either not paved or are paved with stone blocks settled into a more or less rough and irregular surface, but prospective buyers and dealers taking a demonstration seemed not to care for those streets, but chose the better ones and put a premium on speed rather than on practicability.

The large number of modern rigs now in Atlanta present an unusual sequence of beautiful, speedy and nearly noiseless cars. real ornaments to the street and splendid advertisements for the business. But not all of these are pleasure vehicles, and the number of touring cars to be seen hauling lumber to a new building or junk from an old one is unusually large. The conclusion is that Atlanta is passing through the extravagant sporting period of her auto existence; that the past splendid sales records will show very decided falling off during the coming year, and that a demand for low geared, strongly constructed, practical rigs will grow and should be carefully fostered by the dealers. In connection with the latter clause is the surprising fact that there are no motor buggies offered for sale in Atlanta. The South, presumably their special field, seems not to be buying them for two reasons-one, the prominence given to the speedy conventional pleasure type, and the other the fact that such buggies as have been sold in Atlanta have been too heavy, too complicated and not properly built to give satisfaction over the rough stone streets and inferior roads. The absence of the cushioning air tire necessitates quality of workmanship and material, superiority of design and lightness of weight not usually sought for by buyers of these vehicles.

Because of Atlanta's moderate size and the clannishness of her people any word, good or bad, is quickly passed along, and this means that she will soon weed out the unfit and retain the fittest vehicles.

# Revision of French Rules of the Road.

The French Government nearly a year ago took preliminary steps looking to a revision of the present road regulations, which were first adopted some sixty years ago. Louis Barthou, Minister of Public Works, appointed a commission of experts, including motorists, road makers, cyclists, horse owners and the Ministers of Justice and Public Works, to draw up a code to be presented to the Government for adoption.

The experts met last June, and again in October. In the meantime they had gathered together, in a classified form, all the road regulations of all countries. From this mass of regulations they will pick out the best, and with them create an ideal set of laws governing traffic. Although the automobile men occupy a prominent position on the commission, the intention is to study the question from the standpoint of every class of road user, including the foot passenger, the horse owner, the automobilist and dwellers along the roadside. In addition the road builder will be consulted.

Another proposed improvement is that all cases of dispute between any stranger and a native shall not be tried before the local courts, but in the chief town of the department. It is rare, indeed, that the stranger receives fair treatment in a local court.

# A Sensation in Values in France.

Evidently inspired by the policy of several well known American manufacturers the firm of A. Darracq & Cie., of Suresnes, France, have recently brought out a four cylinder, four passenger car, which sells, with body complete, for 5,000 francs ( a trifle less than \$1,000). This practice of selling cars complete with body is a new departure for French manufacturers. It was formerly always held that in the selection of the body the customer should be allowed to exercise his own judgment, and his more or less developed artistic sense, guided and counseled by the body builder, but it seems that the conclusion was reached that the class to whom this thousand dollar car would appeal were not so fastidious. The price no doubt will look very low to French buyers, who only about two years ago regarded a small, low powered four cylinder chassis, without body, at 6,300 francs as very low priced. The American low priced cars imported into France sell, of course, at considerably higher prices there than here.

Although art is said to be cheap in France, it would perhaps be unreasonable to expect much of it in a car of this class, especially since the sensible engineer would aim to provide a maximum of material value. The lines of the new car are plain and severe. But in the chassis design nothing seems to have been unduly skimped. The several parts bought from parts makers, such as magnetos, frames, radiators, tires, are of the most reputable makes (Bosch, Arbel, Grouvelle and Michelin), and the several features of design, illustra-

ted in a description of the car in our French contemporary Omnia, are all well considered, apparently. The chassis is of exceptionally clean design, due in part to the use of an en bloc motor.

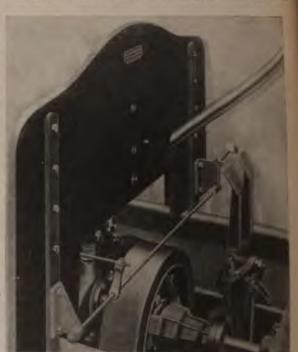

The motor has a bore of 85 mm, and a

stroke of 100 mm. (33/8x4 inches), and is claimed to give a maximum power of 19 horse power at 1,500 r. p. m. A special feature of the design is that all the accessories, including the high tension magneto, the carburetor. cooler fan, water pump and clutch, are secured to the motor, and upon taking out four large bolts, which secure the motor to the frame, the whole power unit can be removed together. The cylinders are all in one casting, which also contains the inlet and exhaust passages, so that outside manifolds are dispensed with. The crank shaft bearings are carried by the upper cast half of the crank casing, and lower half is made of sheet metal and contains a false bottom, below which there is an oil well.

The lubrication system of the motor is one of the most interesting features.

The oil in the oil well is replenished by pouring into the cup TT at the top of the vertical breather tube, which is closed by the cap R. The oil thus poured in flows into the reservoir H at the bottom of the crank chamber, which contains a wooden float B mounted on a counterweighted lever arm. As the level of the oil in the reser-

Q; which is connected to it. The toy mf of this rod projects through a central con ing in the breather tube cap, and its pojecting end is graduated, by which men the operator can instantly determine at in time how much oil there is in the reservice

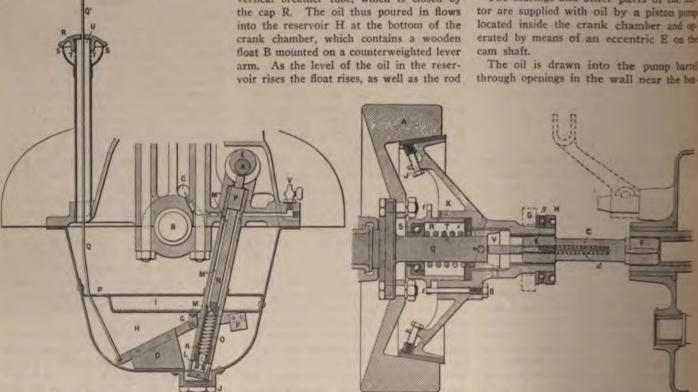

1910 MODEL 14-16 DARRACO.

Showing absolutely clean dashboard, details of clutch inlibrackets carrying pedals.

This oil gauge is also a convenience in filing the reservoir.

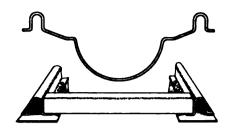

The bearings and other parts of the motor are supplied with oil by a piston pump located inside the crank chamber and or erated by means of an eccentric E on the

The oil is drawn into the pump barrel

DARRACO CRANK CASE CONSTRUCTION AND LUBRICATING SYSTEM.

DARRACO CLUTCH AND FLEXIBLE CONNECTION TO CHANGE GEAR

DARRACO COMBINED PRESSED STEEL FRAME AND UNDERSHIELD

tom; during the down stroke of the plunger it flows through the hollow piston and is forced out through openings in the cylinder wall near the top and through passages drilled in the crank case wall, being finally discharged through the opening C, whence it is projected over all the internal parts.

In addition to this oil circulating system a splash system is also provided. The oil thrown out of the opening C collects in a dip pan I, in which the connecting rod heads dip at each revolution. This dip pan is constantly kept filled with oil, and the excess overflows to the oil well through the opening P.

The clutch is of the regular conical leather faced type, and contains a number of spring pressed plungers for insuring gradual engagement. The male cone is carried on an extension of the crank shaft, and its hub is connected to the primary shaft of the change gear by means of a short shaft with square joints at both ends. The hub of the cone is threaded internally to receive an externally threaded cap which encloses the clutch spring. This spring bears against the collar pinned to the outer end of the crank shaft and against the inner race of a cup and cone ball bearing located in the top end of the cap above referred to. The construction is exceedingly simple.

To remove the clutch the operating lugs of the cap R must first be freed from the bolt B, after which the cap is unscrewed to the limit. The cone may then be moved sufficiently to the right so that by taking hold of the shaft C in the middle and pushing it to the left the head F is liberated and drops of itself. The cone slides on the collar V and may be completely removed.

### Electrics Burned in Transit.

A railway freight car containing a load of fourteen electric vehicles built by the Anderson Carriage Company, of Detroit, Mich., and consigned to a firm in San Francisco, was destroyed by fire at Maple Park, Ill., recently. When the freight train arrived at Maple Park the car was discovered to be burning, and was immediately uncoupled from the train and side tracked. The local fire department was called out and extinguished the flames after the car and contents had been almost completely destroyed.

### Book Reviews.

Two books of special value to beginners, or the ambitious journeyman who has not the advantage of an education in mechanical lines, have been recently issued by D. Van Nostrand Company, 21 Murray street, New York. The two go hand in hand, one being a complement to the other. The first book, "Mechanical Drawing for Trade Schools," is the work of Charles C. Leeds; it starts the student in at the very beginning of mechanical drawing and leads him on by easy stages through the various phases of the subject, the use of drawing instruments, the first easy steps in sketching, and gradually up to the more difficult subjects. The second book, written by Franklin E. Smith, is devoted to mathematics, and begins with numeration and notation, then takes up the many divisions of arithmetic in its simple forms, and leads up to the more complicated and difficult problems. The book deals with tables of weights and measures used by mechanics, signs and characters, mathematical formula, specific gravity, simple machines, strength of materials and questions relating to stress. Both books are written in simple language, which will be far more acceptable to the general student than the text book terms generally used.

Vehicles of the Air, by Victor Lougheed. Published by the Reilly & Britton Company, Chicago.

This is a comprehensive, popular treatise on the subject indicated by the title. The book contains 550 pages, 140 half tone illustrations, and many mechanical drawings and sketches. The photographic reproductions are on heavy coated paper, and particularly clear and distinct.

In the introduction the author deals with the possibilities and promises of aerial travel in the future. The first chapter of the book relates to the atmosphere, the element in which all aerial travel takes place. The author dwells upon the constitution and the various physical properties of atmospheric air. A second chapter relates to lighter than air machines, and the rest of the book is devoted to aeroplanes, the subject being treated historically, descriptively and analytically. A brief history of all of the men prominently connected with the development of flying machines is given, and the events in the aeronautic world during the past year are fully covered. The fine half tone illustrations of most of the recent successful flying machines and of their details are a particularly valuable feature of the book.

The United States Government has refused to pay to the Secretary of State of New York the Nicense fee of \$2 for license No. 75,541, issued to Major General Leonard Wood, on the ground that property of the Government cannot be taxed. Secretary of State Koenig held that the sum was a fee for a service and not a tax, but the Federal Government still refuses to pay.

# Sees an Opening for American Electric Vehicles in Europe.

Emil Gruenfeldt, chief engineer and designer of the Baker Motor Vehicle Company, has just returned from Europe, where he visited the automobile centres, and made a study particularly of the trend in electric vehicles. "The European electric," said Mr. Gruenfeldt, "is only manufactured in the heavy brougham and cab models, and there is a great demand abroad for the light, easily controlled electric runabout. The greatest objection to European electrics is the use of very thin plates in the batteries. which, while they give a greater mileage at the beginning, are so short lived that they are not practical. The series wound motor is becoming standard, and all of the later models are of the single motor type, with double speed reduction and shaft drive. The 'hub' motor built directly into the wheel, which has been so much discussed, is rapidly disappearing, owing to its inefficiency in starting and hill climbing, and the frequent necessity of repairs on account of the severe direct vibration of the wheel on the road.

The "drum" type controller is standard in all European electrics, and the electric brake and recharging points formerly used have been discarded. The whole tendency abroad is to simplify the electric, yet in this respect American designers have far surpassed the best efforts of foreign manufacturers. European electro-chemists experimented with alkali batteries for many years, but could not overcome the disadvantages of the great potential drop under overloads and their limited recuperative power, a fault which the late American batteries of this type still show. The pasted lead battery is the standard abroad.

"Solid tires and cushion tires have both been used abroad, especially for taxicabs, but on account of the heavy vibration of the car and the loosening and breaking of vital mechanical parts they have been practically discarded, and the late cars are equipped with pneumatic tires. Even electric trucks and buses are being equipped with pneumatic tires of the twin and triple type; that is, two or three individual tires side by side on the same wheel.

"For no other type of motor car are there greater opportunities in export business than the electric, and if American manufacturers will establish foreign agencies and push the sale of their cars abroad they are certain to obtain large orders. European cities are much more congested than those in this country, and American electrics are so much superior in design and efficiency to foreign cars that comparisons are odious."

Chauncey W. Hammond, formerly paymaster of the Everitt-Metzger-Flanders Company, Detroit, was held on December 10 under \$10,000 bail for trial on the charge of stealing \$17,000 from the company, by substituting two grips filled with bricks for two containing cash for the factory payroll

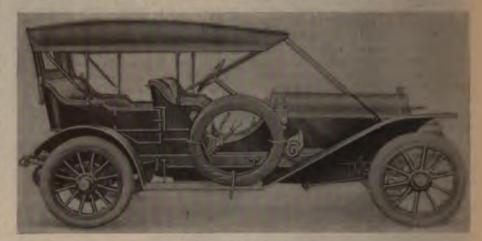

# DESCRIPTIONS OF NEW VEHICLES AND PARTS.

Palmer-Singer Models for 1910. The Palmer & Singer Manufacturing Company, of New York city, are listing two chassis models for the coming season, a "six-sixty" and a "four-thirty." The former, which is known as Model LXII, is equipped with either a five passenger baby tonneau, a gunboat or a racing body, the prices being \$3,500, \$3,900 and \$3,500, respectively; while the four-thirty, which is known as Model XXX, is provided with either a single rumble roadster, a five passenger baby tonneau, or an extension front landaulet body, and sells at \$2,250, \$2,500 and \$3,650, respectively. The town car chassis differs in a number of respects from the chassis for the roadster and baby tonnear cars.

The six cylinder, 60 horse power motor is of 43% inch bore and 51/2 inch stroke; it is claimed to give its rated horse power below 1,200 r. p. m., and to reach its maximum output at 1,600 r. p. m. All of the wearing parts are finished by grinding. The piston pins are hollow, and the connecting rods are nickel steel drop forgings. Antifriction metal bushings are used for the upper ends and bronze bushings for the lower ends. These valves are located on opposite sides; they are made of a special grade of heat resisting steel, and of 23% inches clear diameter. The valve stem guides are renewable. The cams are ground to size with the aid of a master cam, and the cam shaft gears are made with malleable iron spiders and bronze rims, which is claimed to greatly reduce the noise of these gears. The exhaust cam shaft carries small relief cams, which can be brought into action so as to hold the exhaust valves open during part of the compression stroke, by shifting the cam shaft endwise, thus relieving the compression and facilitating the work of cranking the motor. The push rods are provided with hardened and ground rollers at their lower ends and with adjusting screws with noiseless fibre inserts at the upper end. The crank case is east of aluminum, and all of the bearings are supported by the upper half, the lower half

acting only as an oil well and a dust protector.

Breather passages are cored in the arms of the crank case and covered with screen caps. These also serve for filling the crank chamber with oil. Enough oil is carried in the crank case to last for 300 miles, A gear pump draws oil from the reservoir below the crank case and delivers it to a pipe extending the entire length of the upwhich is claimed to render the motor extremely flexible. It contains the usual float chamber from which fuel is led to three nozzles, each in its own Venturi air tube One of these nozzles is provided with an adjusting needle, the movement of which is limited to less than a full turn, and the air passage around this nozzle is always open. The other two air passages are closed at the top by check valves, which are con-

P. & S. SIX CYLINDER CAR.

per case, from which copper tubes lead to the main bearings and to the cam shaft gears. The crank pins receive their lubricant through holes drilled in the crank shaft, through which passes the excess oil from the main bearings. The cylinders and cam shaft bearings are lubricated by splash. All of the oil drains back to the reservoir at the bottom of the crank chamber, and is filtered before it enters the pump again. A float in the oil reservoir, with a tell-tale extension visible in a glass tube in the upper half of the case, shows at a glance the amount of oil in the motor.

The crank shaft is made from a solid billet of hammered steel. The crank throws are sawed out, after which the shaft is heat treated and machined. The final finish of the bearings is by grinding.

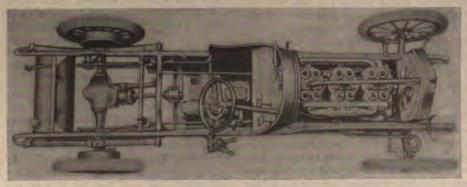

A triple nozzle carburetor is employed,

trolled by a cam acting in unison with the throttle valve, so that the check valves open successively as the throttle is opened. The cam adjustments are made at the factory, and proper nozzle sizes are provided, leaving only the slight needle valve adjustment by which the purchaser may compensate for variations in altitude, fuel or almospheric conditions. Warm air is drawn in, in order to insure proper vaporization of the gasoline.

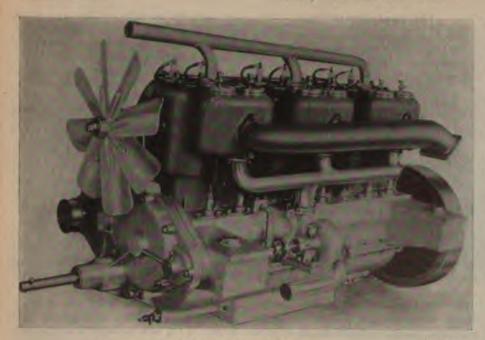

On most of the models the gasoline tank is located at the extreme rear of the chassis, where it can be filled without disturbing the passengers. The gasoline is forced to the carburetor by air pressure. The initial pressure is obtained by a hand pump located on the dash, and after the motor starts the pressure is automatically maintained by exhaust gases from one of the cylinders, which pass through a pressure regulating valve. The pressure required is 11/2 to 2 pounds, and is always indicated by a pressure gauge on the

All models are equipped with a Bosch high tension magneto, and all except the town car have in addition a battery ignition system, entirely independent of the magneto system, for starting. The high tension wires of both systems are carried through a metallic conduit on top of the cylinders, and the inlet and outlet openings of the conduit are provided with insulator bushings to prevent chafing of the rubber cable insulation.

The cooling water is circulated by a centrifugal pump, gear driven from one of the

PLAN OF CHASSIS.

SIX CYLINDER MOTOR.

cam shaft gears, through a honeycomb radiator mounted on trunnion supports. The brackets are fastened to the brass casing of the radiator, and are claimed to completely eliminate all torsional strain on the tubes. The water enters the jackets directly under the exhaust valves, and leaves at the top of the cylinders. A belt driven fan is mounted back of the radiator.

The 30 horse power motor is of 4½ inch bore by 4½ inch stroke. The cylinders are cast in pairs, and all of the valves are on the same side. The rated horse power is claimed to be delivered at about 1,250 r. p. m., while the motor delivers its maximum output at about 1,650 r. p. m. This motor is built along the same lines as the "six sixty," so that it is only necessary to point out the several differences. The lubrication system is exactly the same, and the

cooling system is also the same, with the exception that a fan spoked flywheel assists the radiator fan. The crank shaft bearings, carried by the upper half of the aluminum crank case, are bushed with die cast babbitt bushings, as are also the crank pin bearings. The piston pins are clamped tight in the upper ends of the connecting rods, and have their bearings in the piston bosses. The valves are all located on the right side, and the water pump and magneto are arranged on the left side, in line with each other and driven by a single gear, , with Oldham couplings between, so that one can be removed without disturbing the other. A Stromberg carburetor is used on this model.

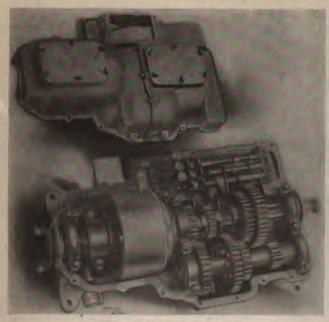

The change gears on all Palmer-Singer models afford four forward speeds and one reverse, the direct drive being obtained on the third forward speed. The gear set is operated selectively. The gears and pinions are made of alloy steel, case hardened, and have very wide faces; they are mounted on large shafts, which are carried in imported annular ball bearings. The clutch is a multiple disc device, running in an oil bath in the front end of the gear box.

The rear axle is of the full floating type, the driving shafts engaging the wheel hubs by means of jaw clutches. At the outer ends of the axle imported annular ball bearings are fitted, while on both sides of the differential and on the bevel pinion shaft four point adjustable ball bearings are used, these taking end thrust as well as radial loads. The differential is of the bevel type, and may readily be removed, together with the bevel gear, after taking off the cover and the bearing caps, and pulling the driving shafts out endwise through the wheel hubs.

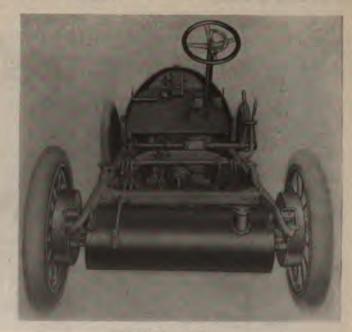

The propeller shaft is specially heat treated and provided with universal joints at both ends, which latter are protected by pressed steel casings and leather coverings, which are filled with grease. The torsional strains are taken up by a torsion rod rigidly secured to the axle near the centre and supported at its forward end upon a spring buffer. Adjustable radius rods carry the forward thrust of the axle to each side frame member, and maintain the rear axle at right angles to the frame.

There are two sets of brakes, both of the internal expanding type, and both acting on rear wheel drums, there being two sets of drums of different diameters. The larger diameter brake is the foot brake or service brake, and the smaller one the hand brake or emergency brake. The brake drums are of pressed steel, and the brake shoes have bronze wearing surfaces. The brake rods are provided with equalizers.

The front axle is an I section hand forging of nickel steel, provided with inverted

CHANGE GEAR.

REAR VIEW OF CHASSIS.

Elliott steering knuckles. These axles are sometimes referred to as of the Mercedes type. The front wheels are mounted on imported ball bearings, and are positively locked against coming off in case any of the balls should break. The steering tie rod consists of a nickel steel tube, and is placed back of the front axle. The forked joints of this rod have particularly liberal bearing surfaces. The steering gear consists of a semi-reversible worm and nut mechanism, which is provided with means for adjustment. The steering lever at the bottom of the gear is a drop forging, and the connecting rod, through which this latter is connected to one of the knuckles, has a universal joint, with large hardened pins and grease cup lubrication at each end, replacing the ball and socket joints used in many cars. The steering wheel is 18 inches in diameter, and comprises an aluminum spider and a wood rim. In addition to the usual control devices there are an accelerator pedal and a muffler cut-out pedal on the toeboard.

All of the springs are semi-elliptic, except the rear springs on the town car, which are three-quarter elliptic. The shackle bolts are provided with oil cups. The wheels have their spokes dished, and the front wheels are slightly cambered. The wheel base of the "Four-Thirty" roadster and baby tonneau is 115 inches, and that of the town car 120 inches. The tire equipment of both cars is 34x4 inches. The "Six-Sixty" has a wheel base of 127 inches, and the tire equipment is 36x4 inches front and 36x4½ inches in the rear.

### Racine Manufacturing Company Works Burned.

The plant of the Racine (Wis.) Manufacturing Company, manufacturers of auto tops, etc., was destroyed by a fire on Sunday, together with the Mitchell Wagon Works and several residences, the total loss amounting to \$650,000.

### The Continental "35."

This is one of the new medium priced cars of the season which has just been announced by the Indiana Motor Sales Company, of Indianapolis, general sales agents. The car is being manufactured by the Indiana Motor and Manufacturing Company, of Franklin, Ind. The price, with an equipment including a Remy magneto, five lamps, a Prest-O-Lite gas tank, horn, jack and tools, is \$1,400.

The four cylinder motor has a 43% inch bore and a 41/2 inch stroke, and the cylinders are offset three-quarters of an inch from the crank shaft centre. The crank shaft is carried in three bearings, all of which are supported from the upper half of the crank case. The lower half of the casing can be removed without disturbing the oiling system or the working parts of the motor. The cylinders are cast en bloc and are provided with large water spaces to facilitate the circulation of the water on the thermo-siphon principle. The valves are extra large, having a head diameter of 2 inches, and are of the combination electtrically welded type. The cams are integral with the cam shaft and are case hardened and ground, as are the bearings of the cam shaft. The valve lifters are of the mushroom type, and are provided with adjusting means and fibre inserts for silent operation.

A late model Schebler carburetor is used, which is supplied from a 15 gallon gasoline tank of oval shape. The Remy dual system of magneto and battery ignition is used, which comprises a Model S induction type magneto and a battery of six dry cells. The radiator is of the vertical tube, honeycomb effect type, and a fan is mounted on the motor back of the radiator.

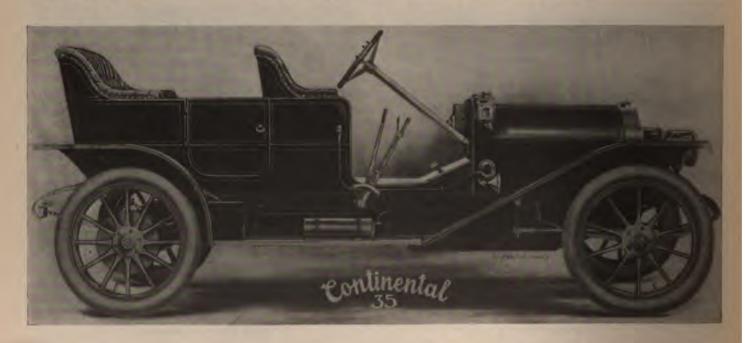

The clutch is of the multiple disc type, comprising sixty discs of high carbon steel running in oil. The clutch spring is adjustable. The change gear gives three forward speeds and one reverse, on the selective principle, and is carried on the rear axle.

All gears are cut from 3½ per cent. nickel steel and are heat treated. The shafts of the change gear are carried in Hess-Bright annular bearings exclusively. The drive to the rear axle is through a set of bevel gears, and the driving connection between the clutch and the gear set consists of a shaft enclosed in a tube, with a single universal joint at the forward end.

The rear axle is of the semi-floating type with New Departure combined thrust and radial load bearings at both sides of the differential, and Hyatt roller bearings in casings at the ends of the shafts. The front axle is an I section drop forging, with the spring pads forged integral. The steering knuckles are also drop forgings, and the spindles are fitted with Timken roller bearings. The steering tie rod is located back of the axle, and the steering rod runs fore and aft.

A worm and worm wheel type steering gear is employed. The stationary brass tube column of 134 inch diameter is surmounted by a 16 inch rubber covered steering wheel, and the spark and throttle control levers move over a stationary quadrant on top of the wheel. The spider of the steering wheel is of aluminum and polished. Two sets of brakes, internal expanding and external contracting, respectively, act on pressed steel brake drums 14 inches in diameter by 234 inches width of face, secured directly to the rear wheel hubs. The brake bands are faced with Thermoid. The emergency brakes are operated by means of a hand lever working in a notched quadrant, while the change gear is operated by means of a hand lever working in an H quadrant.

The frame is of pressed steel, the side members being 3½ inches deep and 1½ inches wide, and having a drop of 2½ inches a short distance forward of the rear axie. The motor is carried on a sub-frame. The frame is supported on 40x2 inch semi-elliptic front springs and 40x2 inch scroll end, full

AMERICAN ROADSTER.

elliptic rear springs. The spring shackles are provided with grease cups,

The car has a wheel base of 116 inches, and the weight is given as 2,000 pounds. The wheels are 34 inches in diameter and fitted with Goodyear quick detachable rims. Fisk tires are the regular equipment, but an option is given on a number of other makes. The dash is of mahogany with brass binders. An aluminum toeboard is provided, while the running boards are of wood and covered with an aluminum matting. The fenders are provided with aprons and heavy beading, and are rigidily supported to prevent rattling. The car is equipped with a five passenger touring car body, with tufted upholstering of machine buffed leather. The rear seats are 48 inches wide inside the upholstering.

### The American 1910 Models.

The American line for 1910—American Motor Car Company, Indianaoplis—consists of six models, known, respectively, as the Traveler, Traveler Special, Roadster, Roadster Special, Tourist and Limousine.

The motor in all except the Roadster Special and the Traveler Special is a four cylinder of the four cycle type, of 5½ inch bore by 5½ inch stroke, developing 50 horse power at 1,000 r. p. m. In the two specials a four cylinder motor of 5¼ inch bore by 5½ inch stroke is used, developing 60 horse power at 1,000 r. p. m. The cylinders in both motors are cast in pairs, and the water cooled by means of a gear driven centrifugal circulating pump.

In the smaller motor the valves are all on one side. In the two larger motors the inlet valves are inverted directly over the exhaust valves and operated by rocker arms, the cylinders being of the L head type. All models, with the exception of the Tourist and the Limousine, are built with the underslung frame chassis which has been a feature of cars of this make from the beginning.

Ignition is by the Bosch high tension dual system, with single unit coil, kick switch and storage battery, both systems operating through the same set of spark plugs. The float feed, auxiliary air valve carburetor is water jacketed and controlled from the dash.

The clutch is leather faced, of the fan bladed cone type. Four speeds forward and one reverse are provided on all models in the selective type transmission, with direct drive on the fourth speed. The drive is direct by shaft to the differential in the floating live rear axle. The front axle is a one piece forging of nickel steel, of I section.

Three models-the Traveler, the Traveler Special and the Roadster-are equipped with the 40 inch wheels popularized on the 1000 Traveler. The wheel bases are: Traveler and Traveler Special, 122 inches; Roadster and Roadster Special, 110 inches; Tourist and Limousine, 124 inches, Springs on all models except the tourist and limousine are semi-elliptic; on the two excepted models they are semi-elliptic in front and platform in the rear. The carrying capacities are: Traveler and Traveler Special, five (three in the rear with the tonneau door swinging forward); Roadster, three; Roadster Special, two; Tourist, seven; Limousine, seven.

### The Warner Anemometer.

To meet a demand that has grown up in connection with aeronautics, the Warner Instrument Company, of Beloit, Wis..

have brought out an anemometer which has been designed especially for use in connection with aeroplanes and aeronautics. It is designed and built on the well known principle of the autometer; in fact, is practically a Model F autometer inverted and provided with the usual anemometer spider and cups. The scale is of course especially calibrated. The instrument is very small, measuring only 171/2 inches from outside to outside of the cups, and weighing complete only 2 pounds. It is claimed to be thoroughly practical and perfectly accurate and to show wind velocity from zero to 60 miles an hour. It is designed to be attached to the frame of the aeroplane within sight of the driver, and in this position will accurately indicate its speed. The Warner Instrument Company have one of these anemometers in use in the Curtiss areoplane purchased last summer by Mr. Warner.

The seventh annual automobile show in Turin, Italy, will be held in the Fine Arts Palace in the Valentino Park, April 2 to 24, 1910. Following American practice the show management will provide all necessary decorations, which will be uniform. An exhibit of flying machines is to be combined with the show, as well as a division for agricultural and industrial applications of the automobile motor.

MERCER CAR.

### Mercer Cars.

Four types of cars on a standard chassis are being produced by the Mercer Automobile Company, of Trenton, N. J. These are a limousine, a five passenger touring car, a baby tonneau with running board seat, and a two passenger runabout, also with running board seat

The motor used is a 43% inch bore by 43% inch stroke Beaver, with valves all on one side, and the oiling system contained in the lower half of the crank case.

A multiple disc clutch is used, together with a three forward speed, selective transmission. The rear and front axles are made by the American Ball Bearing Company, the rear axle being a semi-floating, with pressed steel torque rod, and equipped with two radius rods to take the driving strains. The brakes are internal expanding and external contracting, both on the rear wheel drums, operated by the usual method of equalizers, lever and pedal.

The frame is cold pressed nickel steel. slightly inswept in front, with a drop at rear to get a lower centre of gravity. The steering gear is a worm and sector, with

CRANKLESS TIRE PUMP.

ball thrust washers above and below the worm, and eccentric bushes on the horizontal shaft for adjustment to take up lost motion in the 17 inch steering wheel.

The cooling system comprises a centrifugal pump, ball bearing, belt driven fan and a cellular radiator. The front springs are semi-elliptic, 40 inches long by 2 inches wide, and have seven leaves; the rear springs are three-quarter scroll elliptic, 51 inches long by 2 wide, and have eight leaves. The standard colors are Mercer brown for the baby tonneau and Packard blue, with ivory gear or maroon for the other cars. Cars come fully equipped with five lamps, tools, tire pump, jack, etc.

### A Crankless Tire Pump.

A very simple mechanically operated gear pump for inflating tires is manufactured by Audindau & Cie, of 41 Rue Ibry, Neuilly, France. As shown by the illustration, it consists of an air cooled cylinder, which is screwed into one of the spark plug holes of the motor, and the spark plug is screwed into a threaded hole in this fitting. Within the cylinder A there is a piston C, which is forced to the upper end of the cylinder when an explosion occurs in the motor cylinder. The air in the upper end of cylinder A is then forced through the delivery valve E and a hose secured to the cylinder by the coupling H to the tire which it is desired to inflate. During the next suction stroke the piston C descends in the cylinder A, partly owing to its weight and partly owing to the suction effect. While the piston moves downward the inlet valve D opens and air enters the upper end of the pump cylinder through the passages G., After the tire has been fully inflated the pump is unscrewed from the motor cylinder and the spark plug put back in place.

### The McKeen Carburetor.

The accompanying half tone cut shows a carburetor designed by the McKeen Motor Car Company for use on their gasoline railroad cars of 200 horse power. It is claimed that owing to the fact that a motor car of this kind must frequently be operated at very low speeds, a special design of carburetor is necessary in order to insure the production of a properly dosed mixture throughout a very wide range of suction The spraying principle has, therefore, been done away with, and the absorption principle is used instead, and it is claimed that the amount of gasoline evaporated and absorbed by the air is a direct function of the quantity of air passing through the carburetor. Some experiments with this carburetor have recently been made on an Apperson six cylinder automobile.

# The Beyster-Detroit Delivery

Wagon. The Beyster-Detroit Motor Car Company, whose organization was announced recently, have placed on the market a delivery car, with a capacity of 1,200 pounds, and selling at \$1,000. It is planned to turn out 1,000 of these cars from the company's factory at 1329 Woodward avenue, Detroit, during the coming year.

The car is equipped with a four eylinder motor of 31/4 inch bore by 35/4 inch stroke, rated at 25 horse power. It has an offset crank shaft, which is carried in die cast babbitt bearings, and a fan bladed flywhed is mounted in front. The cooling water is circulated on the thermo-siphon principle. and ignition is by Remy or Splitdorf high tension magneto and storage battery.

A conical clutch running in oil is usel, and a selective type sliding gear transmission is fitted. The drive to the rear wheels is by double chains enclosed in dust-proof aluminum housings and running in oil. Two sets of brakes, both lined with Thermoid

MCKEEN CARBURETOR

act on drums on the rear hubs. The car has a wheel base of 105 inches; 56 inch or 60 inch tread is optional, and the tire equipment consists of 34x2 inch Swinehart solid tires. The front springs are semi-elliptic and the rear springs full elliptic. The weight of the car empty is in the neighborhood of 1,000 pounds. The car is geared to 25 miles per hour, but higher gears can be furnished if so desired. The company call particular attention to the fact that this car was designed for goods carrying purposes from the bottom up, and that it is not a made over runabout with delivery body.

### Registration in Massachusetts.

The Massachusetts Highway Commission began to receive applications for reregristration for next year on December 1. The application blanks contain a number of questions relative to the horse power of the machine, the type of the machine, name of of manufacturer, manufacturer's number, manufacturer's horse power rating, number of cylinders, etc. Special emphasis is placed on the horse power, as the license fee is based on this. The commission will use the A. L. A. M. formulæ in determining the horse power. Owners are also required to state whether they disposed of any cars by sale during the year, the commission hoping in this way to keep track of old cars. Applicants for operator's licenses will have to make answer to sixteen different questions under oath. They will be required to state whether they have had a Massachusetts license before, and if so, what year and what number; the date of their birth, color, sex, height, weight, color of hair, of eyes; approximate number of miles they have driven and kinds of machines they have operated; whether they habitually use intoxicating liquors to excess; whether they have been convicted of any crimes within two years; whether they have any mental or physical disability, and whether they are familiar with the rules of the road. It is estimated that there are over 23,000 automobiles and about 2,500 motorcycles in the State.

### Trebert Gas Engine Company Now at Butler, Ind.

The Trebert Gas Engine Company, formerly located at Rochester, N. Y., have removed to Butler, Ind., where they went because of the more central location as one reason. They inform us that they have largely increased their capacity. J. George Wagner is manager of the company, who turn out engines and transmissions.

### To Make Axles at South Bend, Ind.

A new company at South Bend is the Yuster Axle and Transmission Company, which has been organized with an authorfzed capitalization of \$100,000. Automobile axles and transmission will be manufactured. Those interested in the company are M. Y. Yuster, A. G. Wile and Joseph M. Ricketts. The company will begin operations immediately.

### Fort Lee Hill Climb Concluded.

The remaining events of the Edgewater-Fort Lee (N. J.) hill climb were run off on Friday last. The course was in excellent condition, and as there were fewer spectators present there was not that interference with the contestants which brought the Thanksgiving Day meet to an untimely end. The best time of the day was made by George Robertson in a Simplex, who ascended the hill in 53 2-5s. This time was made in the event for cars selling at over \$4,000. Robertson also won the event for stock cars of 451-600 cubic inch piston displacement in 56s.

Tom Kincaid, in a National car, made second best time, viz., 55s., and won the event for stock cars of 301-450 cubic inch piston displacement.

One accident occurred during the day. Ray Howard, driving a Stearns 30-60 horse power car, ascended the hill at a fast clip and failed to make the last sharp turn. The car crashed into the curb and crushed its right front wheel. Howard was uninjured, and the car was gotten off the course in a few minutes. The summaries follow:

Gasoline stock cars, \$2,000 to \$3	,000;

### E-M-F Company Break Loose from Studebakers.

An announcement of a rather sensational nature was made last week, to the effect that the sales arrangement between the Everitt-Metzger-Flanders Company, of Detroit, and the Studebaker Automobile Company, of South Bend, Ind., had been discontinued, and that the products of the E-M-F Company would in future be sold through the company's own sales organization. It was generally supposed, and was announced at the time Messrs. Everitt and Metzger retired from the company, that the Studebakers held a controlling interest in the company, but, according to the announcement referred to, this is not correct. The reason given for the abrogation of the agreement is that the Studebaker Company did not take and pay for the number of E-M-F Thirties ordered by them during the months of October and November. The disagreements are thought to have their origin in the fact that the Studebaker Company would give agencies for the E-M-F only on condition that applicants would take the agency for the whole Studebaker line and sign up for a certain number of high powered gasoline and electric cars in addition to their allotment of E-M-F Thirties. This proposition is said to have met with disfavor on the part of many desirable agents. The E-M-F Company have begun an active campaign for agents.

The Studebaker Company of New York, represented by Manager Innis, deny the allegations in the E-M-F letter. They state that they have a definite contract with the E-M-F Company, and have lived up to it to the letter, which they also expect of the E-M-F Company.

Automobile Engineers' New York Meetings.

The Society of Automobile Engineers will hold two meetings in New York at the time of the coming automobile shows. The first will be held on January 4, at the clubhouse of the Automobile Club of America, on Fifty-fourth street, west of Broadway, and the second on January 13, at the Engineering Society's building, 29 West Thirty-ninth street. The society will also give a supper during the time of the show, but the place and date have not yet been decided upon.

The nominating committee has made its nominations for officers for the ensuing year, and the ballots have been sent out. The nominations are as follows: President, H. E. Coffin; first vice president, H. G. Chatain; second vice president, Professor Carpenter; managers, H. Cuntz, W. G. Wall and H. M. Donaldson; treasurer, A. H. Whiting.

The racing program of the Brooklands Automobile Racing Club of England for the coming year has been announced. Races are to be held on March 28 (Easter Monday), April 27-28, May 16, June 18, July 13-14, August 1 and October 5.

# COMMENTS AND QUERIES OF READERS.

### Magneto Nomenclature.

Editor Horseless Age:

Isn't it time for some linguistic genius to arise and offer a suitable set of names for magnetos and magneto systems, by which the present confusion and lack of accuracy might be avoided? Imagine a school teacher (automobile school, of course) asking his pupils to define a "high tension" magneto. It is said that grocers classify the staple product of the hen into fresh eggs, strictly fresh eggs and "just eggs." In the same way we have the high tension magneto, "true high tension magneto" and the plain "magneto," which usually satisfies the novice.

The trouble appears to arise from the fact that, while the spark ultimately produced is of the high tension variety in nearly all cases, the magneto in which the impulse originates may be either high or low tension. What the user is mainly interested in is the spark rather than the magneto, since the latter is only a means to the end. Consequently, when asked what ignition system he has or desires he replies, "high tension," as if that ended the matter.

To those in the trade, however, the matter is not so simple. Distinction between types is necessary, and it does not seem more reasonable to describe a magneto according to the ultimate spark than it would be to name the style of carriage according to the breed of horse that happened to pull it.

A magneto containing within itself the elements necessary for producing a high tension spark is fairly described as a high tension magneto, and its maker should not be driven to such verbal shifts as "arc light," "arc flame," or the prefix "true" to indicate his meaning, any more than the automobile builder should be required to prefix "actual" before his horse power rating.

The real need seems to be for some phrase to describe the type of low tension magneto whose current is delivered to a step-up coil and there transformed to high tension. To call it "low tension" without explanation is impossible, and "low tension with separate coil" is equally so. Why not simply name it the "coil type" magneto, leaving the jump spark to be inferred? Belt driven magnetos having separate coils could then be described as "non-synchronous" magnetos.

A similar need exists for verbal distinction between the various dual, semidual and hemi-demi-dual systems now on the market. Probably at least half a dozen could be counted, ranging all the way from that using the same interrupter, coil, distributor and plugs in both systems up to the only real dual system having the magneto and battery circuits entirely separate,

even to the spark plugs. The weight of practice seems to be divided between the real dual systems and the system which uses the same distributor and spark plugs, but with separate interrupters for the two circuits and a special coil for the battery circuit. The writer confesses himself staggered by the problem of finding a name even for the second of these two, but someone ought to find it, and when found it ought to be adopted.

HERBERT L. TOWLE.

# Starting in Cold Weather With the Aid of Acetylene from Tank.

Editor Horseless Age:

I do not know how many have made practical use of the suggestion contained in my article in your "Runabout" number as to the use of auto-gas introduced into the intake pipe for the purpose of easy starting in cold weather. I simply wish to state that further experience has justified all the claims then made. I used the device all last winter upon a single cylinder runabout, and have now installed it upon my two cylinder Buick, and one full turn of the crank set it off this morning, with the thermometer registering 30°. Many of my friends in the vicinity have made use of it with complete satisfaction. Any mechanic can easily and cheaply devise and install the necessary connections. For the good of the order, H. M. WHEELER.

### Clarifying Sperm Oil.

Editor Horseless Age:

I respectfully request that you will instruct me how to clarify and bleach sperm oil. I will greatly appreciate your courtesy.

J. J. E.

[The following three receipts for clarifying and bleaching sperm oil are taken from Cooley's Cyclopedia of Practical Receipts:

A. Sperm oil is purified by violently agitating it with boiling water or steam, by placing it in a deep vessel with a perforated bottom through which high pressure steam is forced for some time. It is afterward clarified by repose and filtered through coarse charcoal

B. The oil is violently agitated with a boiling hot and strong solution of oak bark to remove albumen and gelatine, and next with high pressure steam and hot water. It is lastly dried and filtered.

C. Each ton is boiled for half an hour with caustic soda, one-half pound, previously made into a weak lye with water, or steam is blown through the mixture for a like period; sulphuric acid, one-half pound, diluted with six times its weight of water, is next added; the whole again boiled for fifteen minutes and allowed to settle for an hour or longer, when the clear oil is run off from the water, and sediment into its

bleaching tube; here solution of bichromate of potash, 4 pounds, in oil of vitrol, 2 pounds, previously diluted with water q. s. together with a little nitric acid and some oxalic acid, are added, and after thorough admixture of the whole by blowing steam through it, strong nitric acid. I pound, diluted with water, I quart, is poured in and the boiling continued for half an hour longer; a small quantity of naphtha or rectified spirits of turpentine is then mixed in and the oil finally well washed with hot water and left to settle.—Ed.]

### Convenient Battery Tester.

Editor Horseless Age:

More or less complaint is heard by the manufacturers regarding dead or run down dry cells being shipped with the new cars. Some of these cases are unwarranted, while others are perhaps justified on account of a few cells among a lot of good ones being faulty and thus aging rapidly.

In order to catch any cells that might not be up to standard, the writer devised a simple tester made of an old buzzer or bell. The idea was that it should be so adjusted that a cell giving less than a predetermined amperage would fail to make it buzz, and to accomplish this easily, it was found that one coil should be cut out of the circuit and the springs adjusted with considerable tension to suit the particular case. Flexible wires with suitable handles or terminals were attached.

This buzzer was sealed and placed near the case from which the batteries were taken. By this means each individual cell of the set for a car could be tested in less time than it takes to tell it. If an attempt were made to test each cell with an ammeter much time would be wasted in waiting for the hand to settle.

If the buzzer is tested every few weeks it may be counted on for giving quite reliable results for all practical tests. The buzzer should, of course, be set for only one cell, since testing the entire set of cells would often fail to detect that one cell was dead while the others were in good shape.

The writer knows from experience that this is quite handy about a shipping room, and sees no reason why it should not be in some garages.

"Merowe."

# Number of Speeds on Small Cars. Editor Horseless Age:

I wish you would call the attention of the manufacturer of small cars to the advantages of putting three speeds into them. There are a lot of new small cars on the market, and all, or nearly all, of them have but two speeds. For a man who uses a car in his business, summer and winter, three speeds are almost a necessity, as deep mud or heavy snow will be too much for the high

gear, and the low gear is too slow. The cost of the added gears would be slight, compared with the increased value given the buyer.

I think most of these new makes put in two speeds just because some one else does. But any car of less than 20 horse power would be better with four speeds than with two, and should certainly have three at the least.

I do not think they would lose any sales by furnishing the extra gear, and I know that the next car I get will have three speeds.

I have used an automobile in my practice nearly every day since October, 1899, over ten years, and I know what I am talking about. During the ten years I have used a number of different cars. At present I have three cars, one 35 horse power roadster and two runabouts.

I find my little single cylinder runabout the most practical car I have ever owned, although hardly powerful enough for the winter work that will soon come. For the man who has only one car, a light car of 16 to 20 horse power, with three or even four speeds, is much more practical than a larger car.

A. N. CLARK, M. D.

### Rotary Cylinder Motors.

Editor Horseless Age:

Replying to Mr. Martin's query (November 17 issue) regarding Gnome motor I saw the item in a French daily paper, but regret inability to give name or date. In traveling one picks up a paper without keeping it in his memory. Later I found that a mechanically minded friend had heard the same story, and, accordingly, wrote to you for the details so kindly given.

One point, however, still puzzles me. The Gnome seven cylinder, 4.4x4.8 inch, is quoted by you at 1,177 revolutions as giving only 34.2 horse power. Now a standard motor of this size would give about 60 horse power. If your figures are right (which I doubt), what so much decreases the horse power in the Gnome?

Pardon my saying that you are wrong in stating that oiling is an unsolved rotary problem. The Adams-Farwell solves the oiling problem perfectly.

If Mr. Martin has been six years at work on rotaries he should know that one great unsolved problem in them is the speed. Standard motors run up to 1,800 revolutions when extra power is needed, and a few can be speeded to 2,200 for a few minutes. Rotaries are seldom built to run (because of centrifugal force dangers) at over 800 r. p. m. The Gnome, tested at 1,177, is the highest speed rotary cylinder motor I have ever known, and this speed is only possible because of the nickel steel cylinders used. It results that rotaries at 800 to 1,100 can only give half the emergency (hill climbing, bursts of speed, etc.) speed that the standard motor at 1,800 to 2,200 revolutions

Another problem lies in the great weight of the revolving motor, which, acting as a flywheel, makes an efficient clutch difficult to obtain, and more difficult to maintain. Will not Mr. Martin favor us with an article covering these and other "rotary" points? Many people would be interested.

# Calculation of Compression Pressure.

Editor Horseless Age:

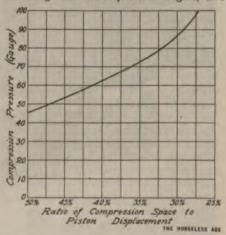

Will you please give me the rule for figuring the actual compression of a cylinder; that is, a rule which takes into account not only the compression due to the piston movement, but also the added compression due to rise in temperature?

M.

[The formula for the compression is

 $C = p \times \left(\frac{v_1}{v_2}\right)^{1 \cdot 35}$ 

where C is the compression pressure in pounds per square inch absolute; p the pressure in the cylinder at the moment compression commences; v<sub>1</sub> the volume of the charge when compression begins, and

v<sub>2</sub> the volume at the end of compression. p is, of course, somewhat less than atmospheric pressure, and may be taken as about 12 pounds per square inch. The above equation has to be solved with the aid of logarithms. If you are not familiar with these you can use the accompanying curve. The equation gives the absolute compression pressure. If you want the gauge pressure you subtract 14.7 pounds from this.—Ep.]

### Using One Cylinder of a Motor for Tire Inflation.

Editor Horseless Age:

There is a suggestion in your last number about pumping tires that seems to me to be of considerable value.

Everyone knows that this is one of the most objectionable features of an auto, and it seems to me it would be quite practicable to make one cylinder of any multicylindered auto serve as a pump for air by a suitable system of pipes and cutouts, while it is driven by the other cylinders. This would avoid any question of injurious gases, get rid of the weight of the extra pump, and as the pipe connections need not be very heavy, would add scarcely anything to the weight of the engine and accessories. William H. Seaman, M. D.

### Duration of Storage Battery Charge When Operating Tungsten Lamps.

Editor Horseless Age:

How many hours would a six volt, 160 ampere hour storage battery furnish sufficient current for two headlights, fitted with 8 or 12 candle power tungsten lamps and a tail light with a 2 candle power lamp, on a single change?

A. G. A.

[Assuming that your storage battery delivers its rated capacity and that the tungsten lamps have an efficiency of I candle power per watt, which is a good average, the battery would last 53 hours with 8 candle power headlights, and 37 hours with 12 candle power headlights.—Ep.]

### Mathematical Articles.

Editor Horseless Age:

The writer has noted your editorial in this week's issue of THE HORSELESS AGE concerning the lack of appreciation of mathematical articles appearing in your valuable paper; and as one of the readers and keen appreciators of these articles the writer enters his protest against their omission in the future. It does not seem commensurate with automobile engineering progress in this country that engineering and technical articles in this line must be sought entirely in foreign journals, as you must well know that THE HORSELESS AGE is the only publication appearing in this country in which articles of this nature have found place for some time past. I trust there may be enough protests raised from the engineer readers of your paper to insure the continuance of these technical and mathematical articles as in the past.

FREDERICK HUGHES.

Editor Horseless Age:

4

I have just read your article on mathematical treatment of automobile matters in The Horseless Age, in which you ask for an expression of opinion about them.

I am not especially a mathematician, and do not often follow out these articles into their formulas and tables, but I hold that the mathematical method is the only one that has real value, and whenever I want to make up my mind on any point it is the mathematical articles on that subject to which I turn for exact information.

If people generally would follow this plan we would have much less time and energy wasted on useless, imperfect and impracticable projects.

WILLIAM H. SEAMAN, M. D.

Editor Horseless Age:

I note your editorial in Horseless Age of December 8 on the question of publishing technical articles of a mathematical nature.

For myself I may say that I am always glad to see such contributions, as they have a permanent value for purposes of reference, and I know of others besides myself who take advantage of them.

FRED N. HOWARD.

# THE FIELD OF COMMERCIAL APPLICATIONS.

### New Motor Delivery Equipment of the Wanamaker Stores.

The John Wanamaker stores, New York City and Philadelphia, are adopting a system of motor delivery which, in many respects, is an innovation, and it is believed will result in great increase in the commercial automobile business. Both the New York and Philadelphia stores of this concern have suburban stables for their delivery wagons, and the new system of delivery consists in transporting goods by large motor trucks to these stables, whence they will be delivered by the smaller delivery wagons.

The trucks to be used for this work are built by the Packard Motor Car Company, and are built on a chassis similar to that described in our issue of April 22, 1908. The load at which they are rated is three tons, though in the present service a load of over two tons is exceptional. The body is built to receive an inner body which may be put in and taken out loaded, and is so constructed that when In place no vibration can occur. This makes it possible to keep the trucks almost continually on the road, for when a loaded car reaches its destination in the suburbs the loaded inner body is taken out and an empty one put in its place. The truck then returns to the store, where the empty body is removed, a loaded one substituted and another trip is begun. While the cars are on the road the bodies are loaded at the store and unloaded at the stables, so that no delays need occur. It is also planned to use these cars for the delivery of large orders of furniture, which can be very safely loaded in them, since the sides are provided with rows of knobs, making it possible to thoroughly rope the load to prevent vibration and damage. The New

York store has been using two of these cars for several weeks, and reports the results as being quite satisfactory. Seven more have been ordered for the New York store and two for the Philadelphia store.

communicating buildings, formerly used as a foundry, one 75x100 feet and the other 50x100 feet, one story in height. Concrete floors have been laid in these buildings, and they are now being transformed

cars and its other motor delivery equip- for commercial cars. The larger building ment the New York store has secured the has a floor space entirely free from posts. premises at 541 to 553 West Twenty-fifth and will be used mainly for storage, while street, New York. This comprises two the smaller one has a line of columns

For the storage and maintenance of these as rapidly as possible into a model garage

INSERTION OF EMPTY INNER BODY.

lengthwise in the centre, and will be used principally for repair work. For carrying on incidental repairs a full machine tool equipment, probably with individual motor drive, will be installed. A Bowser gasoline storage outfit, with tank located beneath the floor of the larger building, is already in place. There are two wash racks, one in each of the buildings. There is to be no elaborate system of fire protection other than the customary sand barrels and hand extinguishers, for the buildings are both semi-fireproof.

# Taxicabs in Wilkes-Barre, Pa. By John B. Mooney.

Although the members of the Posten Transfer Company, who operate the only taxicab company in Wilkes-Barre, Pa., declare that if they had it to do over again that they would never install taxicabs in this city, the general impression among automobile men is that a good, quick, up to date taxicab business here operated by the taximeter system would be a paying proposition.

The Posten Transfer Company one year ago purchased two taxicabs, and have been operating them in the city since that time. The cabs are kept busy during the day, and particularly so at night, the company, however, operating twelve horse driven cabs at the same time. The writer interviewed the members of the Posten firm as to the success they have had with the cabs, and they were emphatic in stating that taxicabs were too expensive to operate in a small city, and that the cost of tire repairs and general overhauling of the cabs used up the profit, the gentlemen asserting that the company for the money expended could realize as much from two horse cabs as one taxicab. The Posten Transfer Company, which operates the cabs, is located at 33 North Main street, right in the heart of the city. A sub-station is located at the Lehigh Valley station several blocks away, the cab firm meeting all trains that arrive in the city.

The cabs are not kept in a separate garage, but are stored along with the horse driven cabs. Four men are employed as drivers, they working twelve hour shifts.

At the general office on North Main street the cabs are stationed when not in actual service, although the management endeavors to have them meet all incoming trains. At the stations a hacking business is carried on, and from personal observation it was found that every customer preferred the quick taxicab to the old method of horse driven cabs.

An ordinance is about to be presented in the city council which will regulate the business to some extent, the idea of the councilmen being to charge a flat rate of 25 cents for the first four blocks, and an additional 25 cents for the next six blocks, or a dollar to the city line, a distance of about a mile and a quarter by the longest route.

The Posten Company at present charge

50 cents for one or two customers within five blocks of the station, and then increase the rate, sometimes securing as high as \$2 per person for crossing the city line and going to the different suburbs. There is no accommodation for baggage outside of a dress suit case, the company operating a baggage line in connection with their other business, and following up the cabs with these wagons. A special flat rate is offered to daily customers, however, but this does not drop under 25 cents for three blocks. As to summer resorts, the company charge as high as \$10 for three to Harvey's Lake, 14 miles from the city along a good State road. There are no taximeters connected with the service, the driver always being allowed to use his discretion in regard to price. The repairs to the cabs are made at the local garages, and consist mainly of tire repairs, although one of the machines was out of commission for a week, owing to a broken axle, which was replaced direct from the factory.

The daily average mileage of each cab is about 50 miles, although this has been exceeded on many occasions. The drivers are given a percentage of the hourly earnings, and they have no fault to find. The gasoline and car ready for service is furnished to the operators. According to the firm the best hours for business up to date have been from 9 p. m. to 6 a. m.

The general opinion prevalent here, however, is that if a good, up to date taxicab company started in business here they could make money. Wilkes-Barre is located in the centre of a population of 200,000 people, all of whom come to the city to secure entertainment and purchase living necessities. There are 34 miles of paved streets, mostly asphalt, within the city limits, and extending out from this are miles of macadamized roads. There are forty-five trains arriving daily in the city, bringing hundreds, besides the best equipped third rail system in the country between Hazleton, 50 miles away, and Scranton, 25 miles from here. Eight different railroad companies come into the city, principally from New York and Buffalo, and hundreds of traveling men are here each week. I interviewed several liverymen in regard to a taxicab business here, and they expressed themselves as being only too willing to take up the proposition in case some firm would install cabs here on a percentage basis. The Posten Company does not advertise its service to any extent, the idea being to keep as many of the customers riding in the old style cabs as possible. The present company has kept no record of oil consumption, and has not entered into the business in a manner which would result in its securing the business.

A Croxton-Keeton taxicab, French type, has been purchased by Frank Mulkern, the pioneer automobile liveryman of Milwaukee, Wis. He has converted all of his cars into taxicabs by equipping them with standard taximeters.

### Electric Stage Line Profits.

The Fifth Avenue Coach Company, New York, has made its first annual report to the Public Service Commission, covering the year which ended on June 30, 1909. The investment is put down as about \$400,000, which is \$230,000 more than in 1908. The total revenue from passengers carried was \$359,405, and the total expenses of operation \$225,566, leaving an income of approximately \$144,700. Of this amount \$65,595 is charged to depreciation, and after taxes and interest on advances have been deducted there remains a net income of \$22,039.

### Commercial Notes.

An automobile stage service has been established between Fort Casey and Coupeville, Ore., by a sergeant of the 149th Company of the Coast Artillery Corps.

The address of the Grabowsky Power Wagon Company, of Detroit, Mich., was erroneously given as Pontiac, Mich., on page 636 of our December 1 issue.

The department store firm of Frederick Loeser & Co., in Brooklyn, N. Y., have recently acquired a number of Packard 3 ton trucks for the delivery of furniture to suburban points and similar long distance work.

Clarence F. Samuelson, chief of the Manila fire department, is in the United States at present inspecting motor propelled fire apparatus, the Manila authorities having decided to equip the department on a motor basis

The Police Department of Scranton, Pa., will shortly be equipped with an Indian motorcycle, the warrant for the order having been signed by the director of public safety and the mayor, and the order given to John Rawlings, who handles the Indian in Scranton. The price of the machine is \$288.80.

Frank Atterberry, who conducts a motor stage service between Sacramento and Folsom, Cal., has ordered from A. Meister & Sons Company, of Sacramento, a two wheeled trailer, capable of seating five passengers, which is to be attached to his motor stage. A recent trial with the trailer is said to have proven entirely satisfactory.

Commissioner of Motor Vehicles J. B. R. Smith, of New Jersey, has sent notice to every person who took out a license in the State this year, to the effect that all licenses must be renewed by December 31, and that the department is now ready to receive applications for renewal. No application for retention of the old numbers will be considered this year.

The Omaha Board of Fire and Police Commissioners have given a contract for two motor propelled patrol wagons to Guy L. Smith, the local Franklin agent. Smith agrees to furnish a 42 horse power patrol wagon at a cost of \$3,765 within ninety days, and a second at 10 per cent. less at a later date, and in the meantime will conduct the service for the police department at \$200 per month.

# AUTOMOBILE LAW AND LEGAL EVENTS.

The Massachusetts State Law Regarding Taximeters,

For some time the control of taximeters has been a vexed question with many legislators, both municipal and State. The legislators of Massachusetts, however, some time ago realized that the taximeter is a sort of measure by means of which services rendered to the passenger are measured on the basis of distance covered and time consumed, and, therefore, the inspection of such instruments, as far as accuracy of the same is concerned, comes within the province of those who have charge of the inspection of weights and measures. However, in order that there might be no dispute in the matter, a law was passed this year placing the inspection of these matters under the State Commissioner of Weights and Measures, and providing for a fee of \$1 for the inspection and sealing of the same. This law was published in full in THE HORSELESS AGE of December 1.

This law in no way interferes with the rights of towns and cities to make such regulations as they may see fit as to the rates of fare, etc. The details as to the method of inspection and sealing and the allowable percentage of error are, however, left entirely to the judgment of the commissioner, as well as discretion as to what forms of mechanism shall be condemned or approved.

Considering the fact that little is generally known about the subject at the present time, and, further, that such regulations should be the result of practical technical knowledge, the wisdom of this course is apparent.

To comply with the law the commissioner has sent out to all the users of taximeters in the State, so far as they are known to him, a copy of the law, and also a circular letter stating that the inspection of the meters is about to be taken up by his office, and that no meters will be inspected and spaled which are not driven from the front wheels of the vehicle.

The method of inspection will be to run the machine over a given mile course on a given tariff. These course are marked by bronze plates let into the curbstone—at the start and finish of the mile, as well as the one-third and one-quarter mile points.

Three of these courses have already been laid out in the city of Boston, one on Beacon street, starting about 25 feet west of Charles, and ending opposite 468 Beacon street, between Hereford street and Massachusetts avenue. A duplicate course starts at this point and runs back to Charles street. The plates for this course are set on the opposite side of the street. The other courses will be on Commonwealth avenue, starting just west of Arlington street.

The third course will be on Columbus ave-

nue, starting just west of Dartmouth street. Considerable care had to be exercised in laying off these courses so that the marks would not come at the intersection of cross streets. The object in having more than one course to a city is to insure that a course is at all times available which is not obstructed by street excavations, etc. It is proposed to have courses laid out in other cities as soon as the demand is felt for them. Courses will probably soon be laid out in Springfield, Worcester, Fall River and Lowell. The method of testing will be to keep

A FULL SET OF THE PLATES USED TO MARK A COURSE FOR THE INSPECTON OF TAX-IMETERS IN MASSACHUSETTS.

the cab as close as possible to the right hand curb and at the start of the course to throw the "flag" to the operating position under Tariff No. 1. According to Boston regulations this corresponds to 30 cents for the first half mile. At the half mile point this should change to 40 cents; at the three-quarters to 50 and at the mile to 60.

The cab can then be turned round, and, going back along the opposite curb, tested for Tariff No. 2. This calls for 30 cents for the first third of a mile and 10 cents for each additional sixth of a mile. The change, of course, should occur at one-third of a mile to 40 cents, at the half mile to 50. at two-thirds of a mile to 60, and at the mile to 80, the change to 70 occurring between three-quarters of a mile and a mile. For waiting time, which is charged at the rate of \$1 per hour, or 10 cents for six minutes, the inspector will use a timepiece of some sort, presumably a stop watch. The commissioner takes the view that it is the duty of his office to protect the public and to see that they get the proper amount of mileage and waiting time for which they pay, and according to present plans meters will be rejected only when they give short measure.

This law also covers the inspection of odometers, which may be used on commercial vehicles, such as trucks, for determining the charge for transportation of a load from point to point, if the charge is figured directly from the indications of the instrument; but not if the odometer is used simply as a basis of estimate.

The measured courses should be of value to all automobilists for testing the accuracy of their odometers.

### St. Louis Model Garage Bill.

The St. Louis legislative department has adopted a model garage bill, which is being re-enacted successively for each applicant to open an automobile garage. The model bill is intended to facilitate legislation and provide uniform regulation for the guidance of officials who are to enforce the law, and to prevent possible charges of partiality by some of the applicants. About ten garages have been opened under authority of ordinances passed in the last six months, and bills are pending for three or four more. The first of the model ordinances was signed December 6 by Mayor Kreismann. All those pending have been amended to conform to the new requirements. Building laws in St. Louis require legislative permission to erect a building for a garage or to conduct an automobile busi-

Following is a copy of the model bill, words in capitals being those which change to fit varying applications:

"JOHN DOE, his heirs, administrators, or assigns, is hereby authorized to erect a brick building to be used for an automobile garage on a lot of ground, or portion thereof, said lot being ONE HUNDRED feet in width and ONE HUNDRED AND SIXTY feet, more or less, in depth, on the NORTH SIDE OF BELMAR BOULE-VARD, BETWEEN GOODFELLOW AND HAMILTON AVENUES, being lots numbered FIFTEEN AND SIXTEEN OF 'CLEMENS PLACE,' in city block num-ber FORTY-FIVE HUNDRED AND FORTY-THREE, and the said JOHN DOE, his heirs, administrators, or assigns, is hereby authorized to maintain and carry on an automobile garage; provided, the said JOHN DOE, his heirs, administrators, or assigns, will at all times keep the premises herein mentioned in a clean and sanitary condition, as required by law; and, provided, and upon the conditions that there shall be no testing of automobiles permitted in the alley back of said garage, nor chauffeurs permitted to sit on the sidewalk in front of said garage, nor chairs or benches placed in front of said garage; and that there shall be at all times maintained in said garage an electric bell with push button which can be rung from the front or rear of said garage for the use of chauffeurs in attracting the attention of employees for the purpose of having them open the doors of said garage. Upon the violation of any of the foregoing conditions the right to maintain and carry on an automobile garage in above described premises shall at once cease and determine."

The provision proscribing the testing of machines in the alley and that requiring electric bells in the garage are both intended to prevent unnecessary noise. Most " of the garages are being established on the few business streets which run through the residence districts, and the alleys in the rear separate the garage in most cases from the home of wealthy residents, who protest against the garages on account of noise. Some of the bills passed in the last few months have provided specially that no opening be left in the rear wall of the building large enough to take an automobile in or let it out, which is another way of preventing noise in the rear. One or two bills have provided any opening of any kind in the rear wall, not even allowing a door for entrance of employees.

# The National Legislative Convention in Washington, D. C.

The legislative board of the A. A., A., which first advocated the policy of uniformity in automobile laws, is about to bring the matter more prominently before the country at large by the first National Legislative Convention, which will be held in Washington, D. C., February 15, 16 and 17. Charles Thaddeus Terry, chairman of the legislative board, has been invited by the officers of the National Civic Federation to speak before that body on this subject at the National Conference on Uniform Legislation to be held in Washington January 17, 18 and 19, just one month before the convention under the auspices of the national automobile body of the United States.

Delegates from all the clubs in the national organization have been requested to attend the February convention, and invitations have been extended to the Governors of all the States in the Union, inviting them to be present in person or by one or more officially accredited representatives. The purpose of the convention is twofold—first, to secure the passage in Congress of the Federal Motor Vehicle Registration bill, and, second, to bring before the official delegates of the various States the necessity of enacting a uniform State motor vehicle law.

In referring to the work accomplished since 1907 for a uniform State motor vehicle law, Mr. Terry said that the progress made thus far was highly encouraging. In twenty-eight States some of the more important features of this State law have already been enacted. Those States which now exempt non-residents from paying an additional

registration fee, provided such motor users have complied with the law is their home States, are: New York, California, Illinois, Indiana, Iowa, Michigan, Minnesota, Missouri, Nebraska, New Hampshire, North Carolina, Ohio, Oregon, South Dakota, Utah, Washington and Wisconsin. In Massachusetts, Vermont and Pennsylvania nonresidents are exempt from registration and license fees for ten days; in Rhode Island for twenty days.

The registration fees, however, vary greatly. In Nebraska and South Dakota the fee is \$1; in Minnesota, \$1.50; in Tennessee, Utah, Maine, Virginia, Washington, Wisconsin and Florida, \$2; in Oregon, Michigan and Maryland, \$3; in Ohio, North Carolina, Missouri and Iowa, \$5; in New Hampshire, \$10, all these being a flat registration fee without regard to the horse power of the machine.

The new Michigan law, enacted at the last session of the Legislature, is a rather close copy of the A. A. A. Uniform Automobile State bill.

Damages Awarded Patentees of Cellular Radiator.

The infringement suit of the Daimler Motor Company, of Unterturkheim, Germany, against Megevet & Cie., of Geneva, Switzerland, has just been decided by the Swiss Supreme Court in favor of the Daimler Company, but instead of damages to the amount of 7,673,000 francs asked for by complainants for infringement of their honeycomb radiator they were awarded only 300,000 francs. The Court of Appeals, of which they had asked an award of 2,250,000 francs, awarded the Daimler Company only 70,000 francs.

### Wisconsin Oil Inspection Law Upheld.

The Wisconsin oil inspection law is held valid by the State Supreme Court, and the Wadhams Oil Company, of Milwaukee, Wis., is denied an injunction to restrain its enforcement. The fee is 10 cents a barrel.

Lava Burner Tip Patent Annulled.

The American Lava Company, of Chattanooga, Tenn., have won their fight against the Dolan patent, No. 589,342, which was claimed to be a basic patent on lava tipped acetylene burners, in the United States Supreme Court at Washington on November 20. The cases were known as D. M. Steward, M. Kirchberger et al. vs. American Lava Company and Paul J. Kruesi, and M. Kirchberger et al. vs. American Lava Company and Paul J. Kruesi, and have been in the courts for over seven years. The Supreme Court sustained the Court of Appeals on the ground that the Dolan patent is invalid because of insufficient specification and improper amendment.

### Legal Notes.

The Secretary of State of Minnesota began to receive applications for 1910 license tags on December 8. The 1910 tags have gold letters on a black background.

The Pennsylvania Attorney General's department has ruled that motor vehicles of all kinds, including motor fire wagons and ambulances, must display State license tags.

The police authorities of Plains Township, Pa., have declared war on automobile speeders, and eighteen drivers were arrested recently for speeding on the new macadam road in the township.

The authorities of Duluth, Minn., are considering an amendment to the city charter which would allow of a wheel tax. The amendment will probably be submitted to the voters at the election to be held in February.

The State Highway Department of Pennsylvania has adopted the A. L. A. M. horse power formula for determining the horse power of cars for the purpose of evaluating the tax imposed by the new law which goes into effect on January 1.

Advices from Boston are to the effect that the Metropolitan Park Commission are strictly enforcing the anti-chain ordinance on the park drives and boulevards. The police are strictly enforcing the eight mile limit on Beacon street at St. Mary's

Considerable surprise has been caused by the action of the board of supervisors of Waukesha County, Wis., in memorializing the Legislature to enact a law taxing every automobile owner \$50 a year for the use of public highways. The board is composed mainly of members from the farming communities.

Because of the frequent accidents the police department of Columbus, Ohio, has received strict orders to enforce the laws regulating traffic. Hereafter anyone driving an automobile or horse drawn vehicle will be arrested for using the wrong side of the street, and he will be prosecuted to the full extent of the law.

In Michigan about 12,000 licenses were issued this year, and it is expected that the number will reach 15,000 next year. Under the new law the numbers are supplied from the Secretary of State's office at Lansing at a cost of \$3 each, which entitles the purchaser of the license to two steel numbers which are to be placed on the machine, one in front and one in the rear. Already twenty-five applications have been received for 1910 license.

### **Business Troubles.**

Wm. A. Geoghegan has been appointed receiver for the Cincinnati Motor Express Company, which has been operating a motor express service between Cincinnati and the Mill Creek Valley towns, with an office in Elmwood place, Cincinnati. The petition was made by several of the stockholders. It is alleged that the assets are worth \$7,500, and the liabilities amount to only \$3,200, but there is no ready money, and the stockholders refuse to further endorse the company's notes.

# Sign Boarding the Roads Around Chicago.

The Chicago Motor Club will shortly complete a campaign of sign boarding the country around Chicago, in which it has been engaged during the past two years. In planning the campaign the sign board committee of the club kept in mind the fact that eventually this work must be attended to by the various counties, for the reason that when the posts are put up through private enterprise there is nothing to protect them from the depredations of miscreants. Besides, the cost of sign boarding is so great that motoring interests cannot well be expected to bear it alone.

The Chicago Motor Club, therefore, figured that by taking four of the big trunk lines running out of Chicago and properly marking them an object lesson would be furnished with which the club might go before the county supervisors and ask that all roads be treated in a similar manner, and also go before the Legislature and ask for the enforcement of the old law, or the enactment of a new one, that will make it compulsory for road supervisors to keep all roads in their territories properly marked.

With the groundwork in sign boarding completed, the Chicago Motor Club has resolved to devote itself henceforth principally to the causes of good road and sign boards, believing that they are most closely connected with motoring success in the Middle West. The club believes, however, that success in both of these lines can only be achieved by the co-operation of the leading clubs and organizations.

The sign board campaign really started about three years ago, when the Illinois Sign Board Commission was formed, and nearly \$100 was raised by popular subscription to push the work along. Some sign boards were purchased and a few put up, but then the interest of the commission

failed, and eventually the Chicago Motor Club took up the work. At the annual meeting of the club a week ago Chairman Lawrence of the sign board committee announced that he had practically finished three of the four routes selected, and that the last one would be completed in a few weeks. At the end of this month he will have expended \$2,000 for signs, and will have put up 290 posts with 787 signs on them. In addition there will be placed at the corner of Jackson boulevard and

and Genoa Junction, which route was made possible by E. E. Ayer, who contributed the \$500 for marking this course. Both these are done at the present time. The route to Milwaukee is finished, with the exception of the last 15 miles, and this will be completed as soon as the ground is frozen, the Chicago Motor Company, Packard agents, having agreed to finance the proposition. This leaves only the Chicago-South Bend route to be marked, and this will be taken up at once.

SIGN POSTS ERECTED BY CHICAGO MOTOR CLUB,

Michigan avenue, Chicago, the central point of this movement, a large tablet giving the direction and distance to nearly every town of importance within 100 miles of Chicago.

Four routes will be ready for touring next summer. The first one completed is the one to Beloit, by way of Elgin, Algonquin and Lake Delevan. Another route will be to Lake Geneva, by way of Rogers Park, Niles Center, Wheeling, Wauconda

In carrying out the work the first thing the committee did was to send out expeditions to mark the various courses, picking out the locations for the signs. Three cross road maps were made in outline One showed the conventional four corners, and on it could be marked just where the post should go. Another showed two roads converging into one that could be marked in the same manner. A third showed a right turn, a left turn and a railroad crossing. Another part of the chart prepared showed where the various sign boards were to be put up. In this manner all the data required was collected hefore the signs were ordered. Then Mr. Lawrence sought hids for the work.

The Featherstone Foundry and Machine Company were the successful bidders for the signs, the prices agreed upon being 65 cents for a cast iron sign 20 inches long and 4 inches wide; \$1.15 for a double sign and \$1.75 for a triple sign. Where more signs were required on one post it was possible to use several styles and combinations, as, for instance, the Latrobe Steel Mills sign at Melrose Park. On the way to Elgin there is a sign on which there are seven tags. In all 787 signs were crdered, the aggregate cost of which was in the neighborhood of \$600. Then it came to the selection of posts on which these signs could be placed. The contract for these was placed with the Hines Lumber Company, which furnished 200 tamarack posts, 12 feet long and 4 inches square, at a cost

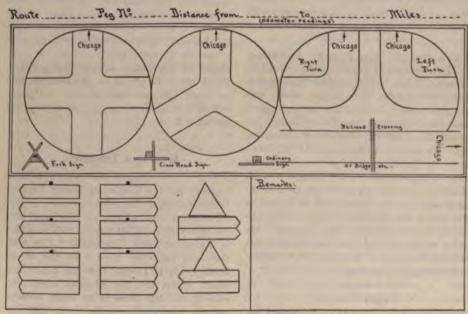

CHART PREPARED BY SIGNBOARD COMMITTEE.

of \$22 a thousand feet, the total cost being approximately \$100.

A contract was then made with Joseph T. Elmore and Herbert J. Ross, of the Chicago Ad Sign Company, to paint, deliver and erect these signs on the different routes at \$3.55 a post, the contract netting approximately \$1,000. The contract called for painting the posts with creosote paint, painting the signs themselves with non-rusting paint, painting the letters in white enamel, boring holes in the signs by which they could be fastened to the posts, attaching the signs and then putting up the posts in holes 4 feet deep. This completed, it was necessary to anchor and tamp each post.

Under the contract Elmore and Ross were to provide their own means of transportation. The Randolph Motor Car Company, of Chicago, donated the use of one of the company's light trucks, but Elmore and Ross paid the expenses of the expedition and the salary of the driver.

A supply of posts and signs is shipped along each route, a bunch being dropped every 30 miles. These are picked up by the truck and distributed over the next 30 miles of territory. It requires two men to place the signs. As one man is digging the 4 foot hole in the ground the other is attaching the sign to the post. It takes about three hours to place a post, and sometimes more, according to the conditions. At the Latrobe Steel Mills it took one day because the ground there is made up of steel filings, which made the work specially laborious. In favorable weather the expedition can label a 100 mile course in one week.

Considerable difficulty was encountered in getting all the permits for the erection of the signs, one objection frequently raised being that the signs would increase the motor travel along the routes, which was considered undesirable. In summing up the situation and the expense, Chairman Lawrence finds that to the cost of \$3.55 per post there must be added the sum of 15 cents a mile for pegging out the routes preliminary to putting up the signs.

Reduced Rates to New York Shows.

The American Automobile Association will hold open meetings at 437 Fifth avenue, New York, during the two automobile show weeks, and reduced round trip railroad rates of a fare and three-fifths have been granted by the Trunk Line Association. Members of the A. A. A. automobile clubs residing in the following territory can take advantage of the reduction: New York, New Jersey. Pennsylvania, Delaware, Maryland, District of Columbia, Virginia (points on Chesapeake & Ohio and Baltimore & Ohio), West Virginia, Ohio, Michigan (east of Lake Michigan), Indiana, cities of Louisville, Ky., and St. Louis, Mo. Stations in Illinois, including Chicago and points east of and on line of the C., R. I. & P. R. R., from Chicago to Peoria; thence the T., P. & W. R. R. from Peoria to Burlington; thence Mississippi River to Cairo, Ill.

A. A. Members residing at points outside of the territory above defined should purchase regular one way or excursion tickets to the nearest point from which a certificate reduction has been authorized, and there repurchase one way ticket and secure certificate to New York city.

Tickets and certificates for the Grand Central Palace Show may be purchased not earlier than December 28 nor later than January 2 for the trip to New York, which certificates when duly validated will entitle the holder up to and including January 11 to a continuous return ticket over the route upon which the going journey was made. Tickets and certificates for the Madison Square Garden Show may be obtained not earlier than January 5 nor later than January to for the trip to New York, which certificates when duly validated will entitle the holder up to and including January 19 to a continuous return ticket over the route upon which the going journey was made.

# Ohio Has Twenty-three Thousand Cars.

Ohio has 23,000 automobiles operated within its borders that have been registered with the State Automobile Department. That number was reached Saturday, December 11, and it is believed that no others will be registered during the present year. The twenty-third thousand set of plates were given to Miss M. L. Ferrin, 3666 Reading road, Cincinnati. State Registrar of Automobiles Fred H. Caley estimates that fully 40,000 motor cars will be registered during 1910. Applications for next year's registration are coming in fast.

Flat Tire Club for Indianapolis.

Automobile dealers and manufacturers of Indianapolis have organized the Flat Tire Club. This is a successor to the former Indianapolis Automobile Trade Association, which some months ago was merged with the Indiana Automobile Club, an inactive organization. The new club meets each day at a downtown café for lunch, and on Thanksgiving night had a banquet. Offi-

cers are: George A. Weidley, of the Premier Motor Manufacturing Company, president, and Frank B. Willis, of the Willis-Holcomb Company, secretary and treasurer.

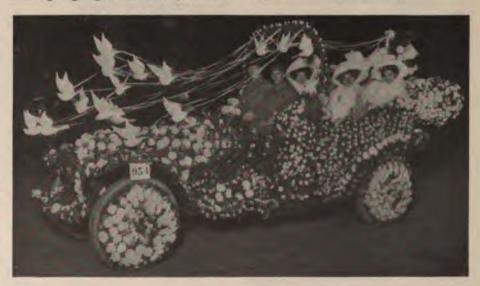

Program of Indianapolis Meet.

On December 11 fifteen entries had been received for the race meet to be held on the Indianapolis Motor Speedway at Indianapolis on December 17-18. It was expected that this list would be increased before the opening day of the program. Entries made at that time were as follows: Nordyke & Marmon Company, 3 cars; National Motor Vehicle Company, 5; Empire Motor Car Company, 2; Cole Motor Car Company, 2; American Motor Car Company, 1; Lewis Strang, driving a Fiat, and Walter Christie, driving a Fiat. A feature of the opening day will be sealing the brick course with a gold plated brick.

The race program will include speed trials for one-fourth, one-half, I mile and I kilometer, for all classes from under 161 cubic inches piston displacement to from 450 to 600 cubic inches. There will also be longer events, ranging from 5 to 100 miles, for practically all classes. The Speedway management has announced that the following meets will be held during 1910: May 27, 28 and 30, automobile races; July 1, 3 and 4, automobile and balloon races; July 23, aviation meet; August 12-13, twenty-four hour race; September 3 and 5, automobile races, and October 7 and 8, automobile races.

### Tastily Decorated Car.

The accompanying half-tone cut shows a 1900 Pierce-Arrow, 48 horse power touring car, owned by William Bausch, of the Bausch & Lomb Optical Company, of Rochester, N. Y., which won the prize in an automobile parade which formed one of the events during the Industrial Exposition held in Rochester, October 11-23. The car was decorated by J. B. Keller's Sons, florists, who used for the purpose 1,200 yards of smilax, 4,000 carnations, 1,200 chrysanthemums and 1,600 roses.

### Trade Literature Received.

Brewster & Company, New York City.-Catalogue of Delaunay-Belleville motor cars.

The Ohio Electric Car Company, Toledo, Ohio .-"The Ohio Electric and Its Construction."

Berkshire Auto Car Company, Pittsfield, Mass,— Catalogue of Berkshire motor cars for 1910. Rex Wrench Company, Boston, Mass.—Circular

of the Rex drop forged, adjustable wrench sets.

J. S. Bretz Company, Times Building, New
York.—Catalogue of the U. & H. Master magneto,
Muncie Gear Works, Muncie, Ind.—Circular of

the Muncie patented wheel brakes, sprocket wheels

and jack shafts.

The Scagrave Company, Columbus, Ohio.—
Booklet containing a reprint of an address on
"Motor Propelled Fire Apparatus," delivered before the Pacific Coast Fire Chiefs' Association in Seattle on September 9 last by J. H. Carlisle, chief of the Vancouver (B. C.) Fire Department, R. M. Owen & Co., Lansing, Mich.—Catalogue

of 1010 Reo cars.

The F. B. Stearns Co., Cleveland, Ohio.-Catalogue of Stearns motor cars.

Dayton Motor Car Co., Dayton, Ohio.—Cata-

logue of Stoddard-Dayton automobiles.

Gray & Davis, Amesbury, Mass.-Folder entitled "Electric Attachment for Gas Headlights."

The Sireno Co., 39 Cortland street, New York

City.—Catalogue of the Sireno electric born.
Ford Motor Co., Detroit, Mich.—Price list of
parts and instruction book for the Ford Model T. Indiana Motor Sales Co., Odd Fellows' Building, Indianapolis, Ind .- Circular of the Continental 35. Westchester Appliance Co., 13-15 Canal Place, Bronx, New York City.—Catalogue of automobile

Knox Automobile Company, Springfield, Mass. -Circular of advance information regarding Knox

pleasure cars for 1910.

Auto Improvement Company, 304-322 Hudson street, New York City.—Catalogue of "Ever Ready" speedometers for 1910.

The Beyster-Detroit Motor Car Co., 1329 Wood-

ward Avenue, Detroit, Mich .- Advance circular of

the Beyster-Detroit delivery car.

Hoyt Electrical Instrument Works, Penacook, N. H.-Circular of Type 35 Hoyt voltmeters and ammeters and T. U. voltammeters.

The Fritchle Automobile & Battery Company,

1510-30 Clarkson street, Denver, Col.—Catalogue of "The 100 Mile Fritchle Electric."

The Hartford Rubber Works Co., Hartford, Conn.—Booklet entitled "Between You and the Road," relating to Hartford automobile tires.

Stevens-Duryea Co., Chicopee Falls, Mass.— Leather bound pocketbook containing specifications and color samples of Stevens-Duryea cars.

H. H. Franklin Manufacturing Co., Syracuse, N. Y.—Booklet entitled "Why the Franklin Is the Most Comfortable and the Most Reliable of All Automobiles.

Isaac G. Johnson & Co., Spuyten Duyvil, N. Y. Booklet entitled "The Danger of Malleable Iron for Automobile Parts," relating to cast steel parts

made by the Johnson Co.

The Diamond Rubber Co., Akron, Ohio.—Catalogue of hard rubber parts; catalogue of motor buggy special tires and catalogue of the new Diamond demountable rim.

The Rapid Motor Vehicle Company, Pontiac, Mich.—Booklet, entitled "The Man from Missouri," relating to the part of the Rapid truck in the Glidden Tour last summer.

The Allen Auto Specialty Co., 1926 Broadway, New York.—Allen's Specialty for the Motor Car.
A catalogue covering tire holders of all descriptions, lamp covers, knuckle boots and tire casings.

### Coming Events.

Show, Duquesne Garden Automobile Dealers' As-

May 30-Denver Col., Road Race, Denver M. C.

### Foreign Events.

January 10-Paris, France, meeting of Inter-

January 28 to February 5—Edinburgh, Scotland, Automobile Exhibition at Waverley Market, Scot-tish Motor Trade Association,

March 19 to April 3-Berlin, Germany, Automobile and Motor Boat Exhibition.

June 2-8-Annual Prince Henry Touring Com-

petition, German Imperial Automobile Club.

The Motor and Accessory Manufacturers' Association will hold their annual meeting at the Waldorf-Astoria Hotel, New York, on January 5, at 6 p. m., and their second annual banquet at the same place and on the same date at 8 p. m.

The Manufacturers' Contest Association will hold its first annual meeting at the Manhattan Hotel, New York, on January 7. President Benjamin Briscoe will preside.

## GARAGE AND SALESROOM.

### Dealers' Association Notes.

The dealers of Des Moines, Ia., are discussing the advisability of holding a local show in the Coliseum some time in February.

Detroit automobile dealers and manufacturers drew for space at the show to be given in the Wayne Casino, January 24-29, on December 1. Fifty-eight different makes of cars will be exhibited, of which thirty-two have never been shown in Detroit be-fore

The Automobile Dealers' Association of Syracuse, N. Y., at a meeting held at the Yates Hotel on December 6, decided to hold their annual show in the State Armory on March 14-19, immediately following the Boston show, and started active preparations for the event.

Drawings for spaces at the show to be held in the National Guard armory, Minneapolis, during the week of February 21-28 took place last week at the Minneapolis Automobile Club. Twenty-three representatives of local dealers took part in the drawing. Walter Wilmot will manage the exhibition.

Washington, D. C., dealers met at 1420 New York avenue on December 2 for the drawing for spaces at the show which is to be held in Convention Hall during the week of January 24. B. R. Johnson, of Baltimore, will be general manager of the show. The show will probably comprise an aeronautic section. The officers of the show committee are: W. C. Long, chairman; John S. Larcombe, Jr., secretary; John R. Thomas, treasurer.

The old Dealers' Association of Los Angeles, Cal., was dissolved a short time ago, and a new organization was formed at a meeting held in the office of Ralph C. Hamlin, a Franklin agent in Southern California, on December 2. The latter, however, does not include all of the dealers of the city, as may be inferred from the name adopted, viz., the Licensed Dealers' Association. At the organization meeting twenty-nine dealers were represented. The association is to be incorporated, and officers are to be elected at an early date.

The Philadelphia Automobile Trade Association held its annual meeting in the Odd Fellows Temple on December 7. The election of officers resulted as follows: J. A. Wister, president: H. B. Larzelere, vice president, and W. F. Foss, treasurer. The secretary's report shows that the association now has fifty-three members. A committee appointed some time ago to look into the advisability of adding club or social features to the program of the association made a verbal report, and will continue its work.

Garage Notes.

Pasadena, Cal.—The Nolan Garage, formerly the Union, has been remodeled. Charles L. Gardiner, formerly of the E. R. Thomas Motor Company, is superintendent; E. W. Eastman, former manager of the Glenwood Garage, at Riverside, is manager of the rental department, and Thomas Hopkins will have charge of the repair shop.

**San Bernardino, Cal.**—The building formerly occupied by Brazelton's stables on Third street is to be converted into a garage.

Hartford, Conn.—The Elmer Automobile Company, of 1100 Main street, will move to larger quarters in the Ashwell Garage at 341 Trumbull street. They handle the Ford car.

Washington, D. C.—J. W. Connelly has succeeded R. A. Klock as general manager of the Dupont Garage Company. Mr. Klock has associated himself with John V. Barross, under the firm name of Dupont Sales Company. They are agents for the Lozier, Columbia and Detroit electrics.

Pensacola, Fla.—Leslie E. Brooks and Herron D'Alemberte have let the comtract for a two story brick garage on West Garden street, between Baylen and Spring streets.

Atlanta, Ga.—The Maxwell-Briscoe Southern Company have moved to 832 Peachtree street, pending the erection of a permanent garage and repair shop.

Atlanta, Ga.—R. T. Peckham, formerly traveling salesman for the York Motor Car Company, has resigned to associate himself with Capt. G. V. Heidt, of the Pullman Auto Company, 10 Auburn avenue, agents for Pullman cars.

Twin Falls, Idaho.—Frank Belleville and F. C. Dawson, of the Western Automobile Company, have completed the construction of a 48x110 foot garage.

Twin Falls, Idaho.—L. A. Burson has purchased two lots on Shoshone street on which he will erect a \$6,000 garage. He will handle the Petrel car exclusively.

Chicago, III.—The Fiat Automobile Company has established a permanent branch here which will soon move into a new three story 70x150 foot building at 2347-53 Michigan avenue. The Chicago branch will be a central distributing point for the Middle West, and agencies will be established in all of the more important cities of that section.

Chicago, III.—F. Matthews has purchased a 49x196 foot lot on Michigan avenue and Thirty-sixth street, on which he will crect a garage and salesroom. Consideration, \$20.000.

Highland Park, III.—The Woods Motor Vehicle Company is installing a mod-

ern garage for the accommodation of patrons who live north of Evanston.

Kewanee, III.—Work has begun on a garage to be erected on Commercial street for W. T. Pierce and Wilbur H. Peterson, who will do a general automobile and repair business. The building will be ready for occupancy about the first of January.

Indianapolis, Ind.—The Studebaker Brothers Indianapolis Company have moved into their new salesroom and garage on North Pennsylvania street. The building has six stories, four of which are occupied by the Studebaker Company. Frank Staley, formerly vice president of the H. T. Hearsey Vehicle Company is manager.

Atlantic, Ia.—The Republic Motor Company, of Hamilton, Ohio, have let a contract for the erection of a concrete garage on the site of the old Hedges livery stable at Walnut and Fifth streets.

De Witt, Ia.—Lew Irwin is clearing ground for the erection of a 50x60 foot cement block garage.

Grinnell, Ia.—Charles Hink has taken over the garage on Main street operated by Robinson & Hink, Mr. Robinson having sold out his interest in the business.

Cheney, Kan.—A. B. McMirris & Son. of Ft. Scott, will open a garage here in the near future.

Salina, Kan.—F. W. Reed, of Salina. and P. D. Miller, of Lorraine, Kan., have formed a partnership and secured quarters at 131-33 North Fifth street, where they will open a garage and store about February 1. They will sell the Velie, Mason. Fuller and other lines, and conduct a general garage and repair business.

Owensboro, Ky.—The Carriage Woodstock Company broke ground last week for an addition to its plant which is to be used for the manufacture of automobiles. The company have already turned out two cars.

Athol, Mass.—George Brewer has purchased the Woodis carriage shop on Main street, which he will remodel as a garage. In the rear of the old building will be erected a structure for the storage of automobiles.

Boston, Mass.—Eugene N. Foss has begun the construction of a garage on Commonwealth avenue, near Beacon street.

Boston, Mass.—The local Maxwell branch, known as the Maxwell-Briscoe Boston Company, is now located in its new headquarters at the corner of Massachusetts avenue and Newbury street.

Haverhill, Mass.—The Hill Motor Car Company have leased the Empire Rink on Oak street, and will convert it into a garage.

Jamaica Plain, Mass.-The Martel

Motor Car Company has moved into its new quarters on Washington street.

Detroit, Mich.—A fire broke out in the garage in the rear of No. 60 Pingree avenue last week, badly damaging the building and destroying a new six cylinder Welch touring car, valued at \$6,400. The cause of the fire is unknown. Samuel Turner, chauffeur, who was working in the garage at the time, was badly burned about the face and hands.

Flint, Mich.—The garage of Harry Kanouse and a \$4,000 automobile stored therein were totally destroyed by a fire caused by the explosion of a gasoline tank.

Saginaw, Mich.—The Erd Motor Company will erect a \$12,000 building on Niagara street, between Mackinaw and Van Buren streets. It will be 150x50 feet, with two wings 36x40 feet.

Minneapolis, Minn.—The Mich-Stair Auto Company, now at Hennepin avenue and Ninth street, have closed a contract for the construction of a garage, salesroom and repair shop in the rear of the Knobloch Building with a frontage of 72½ feet on First avenue, and a depth of 65 feet on Eighth street.

Minneapolis, Minn.—B. E. Stimson, of the Maxwell-Briscoe Minneapolis Company, and Clarkson Lindley have closed a deal for the erection of a 47x125 foot, two story brick garage on Hennepin and Fifteenth streets, to be known as the Electric Garage, and to be operated by the Hathaway-Stimson Company. The Electric Garage Company are now occupying temporary quarters at 900 Hennepin avenue.

St. Louis, Mo.—Brown Brothers, agents for the Peerless and Detroit electric, will erect a three story 130x160 foot brick garage on the corner of Clarendon and Delmar avenues. When the building is completed the Park Automobile Company will occupy it, jointly with the owners. There will be a stone wall partition separating the two concerns, so that each company will have a showroom 65x160 feet. The building at present occupied by the Park Automobile Company, at 4432 Olive street, will be occupied by the Lindsay Motor Car Company, who handle the Interstate car.

St. Louis, Mo.—The Phœnix Auto Supply Company, 3932 Olive street, have opened a gas tank recharge station

Beatrice, Neb.—The Wheaton Automobile Company have moved into new quarters in the Kirkpatrick block, corner of Fifth and Ella streets.

Omaha, Neb.—C. F. Louk Company are constructing a garage and showrooms at 2050 Farnam street. The showrooms will be 20x50 feet, behind which will be a stock room and repair shop.

Omaha, Neb.—H. H. Van Brunt, of Council Bluffs, will erect a 50x100 feet garage on Farnum street.

Trenton, Neb.—The Taylor Motor Company have resumed work on their new garage, which was delayed some weeks on account of the snow.

Plainfield, N. J .- Much local opposi-

tion has developed to the granting of a permit to the F. L. C. Martin Automoabile Company for the installation of a 10,000 gallon gasoline tank on its property at 304 Park avenue. A public hearing on the matter was given by the common council on December 6, in which it was brought out that in New York city the limiting size of gasoline tanks permitted is 275 gallons; in Jersey City, 1,375 gallons; in Louisville, 250 gallons; San Francisco, 1,200 gallons; Knoxville, 210 gallons; Baltimore, 275 gallons, and Atlanta 200 gallons.

Buffalo, N. Y.—A permit has been been granted for the construction of a 66x100 foot garage for Miss Emma Brunemeyer, to be known as the Central Garage.

Gouverneur, N. Y.—A combined garage and amusement hall erected by A. S. Whitney, on John street, was opened to the public last week. The ground floor is laid in cement and will be used for the garage, while the upper floors are set apart for society events. The structure is of stone and marble.

New York, N. Y.—The Peerless Motor Car Company have opened a salesroom and offices at 1760 Broadway, near Fiftyseventh street.

Rochester, N. Y.—T. J. Northway has purchased lots 92 and 94 Exchange street, the property having a frontage of 54 feet and a depth of 138 feet, on which he will erect a \$35,000 garage and showrooms.

Columbus, Ohio.—C. W. Cain has leased rooms at Fourth and Spring streets, where he will open a garage. He has the agency for the American.

Columbus, Ohio.—The McDonald Automobile and Livery Company, recently incorporated to handle automobiles, will be the 1910 agents for the Buick line in Central Ohio. The announcement was made after J. A. Taft, George E. Bazler and P. F. Wilkinson returned from Cleveland. The concern, which is located at 1084 North High street, will have a large space at the coming automobile show. In addition it will handle the Welch-Detroit touring car.

Columbus, Ohio.—The Early Motor Car Company, of which Dr. L. M. Early is president, will open a salesroom near the corner of Town and High streets in a few days. The room will have a frontage of 40 feet on the principal street of the city. The company are Columbus agents for the Rambler and the Babcock electric. Douglass McCormick, well known in automobile circles, will be general manager.

Norwalk, Ohio.—The C. F. Jackson Company have purchased a site opposite the Avalon Hotel, on which they will erect a two story, 60x80 foot, fireproof garage. The building will be of brick and steel with concrete floors, and will be ready for occupancy about March I.

Dallas, Ore.—D. F. Harris has purchased the interest of his partner, Henry Stump, in the Dallas Garage.

La Grande, Ore.—D. A. Barnes has let the contract for a new garage.

Philadelphia, Pa.—Heary B. Leske has

reconveyed to John E. Hutchinson the garage property at 238-40 North Broad street, subject to a mortgage of \$65,000.

Philadelphia, Pa.—The Huntington Garage Company will erect a 90x90 foot garage at 1607-15 Huntington Park avenue.

Pittsburg, Pa.—The Morewood Garage has been opened at Center and Morewood avenues. A repair shop is conducted in connection with the garage.

Pittsburg, Pa.—McAllister Brothers Motor Car Company have purchased a 93x142 foot plot on Beatty and Baum streets, on which they will erect a garage and salesroom. They are at present located at Penn avenue, East End.

Houston, Tex.—The Auto and Motor Boat Company have let a contract for the erection of a two story garage on Milam street and Capitol avenue, at an estimated cost of \$10,000. Construction will begin at

Salt Lake City, Utah.—James H. Moyle has obtained a permit to build a two story brick garage at 121-125 State street, to cost \$50,000.

Beaver Dam, Wis.—The Silo Garage, 220 Front street, was badly damaged by fire last week. The loss is partly covered by insurance.

Milwaukee, Wis.—The Stevens-Duryea headquarters have been moved from Fourth and Prairie streets to 482 Milwaukee street. The Aikin Motor Car Company are State representatives for Wisconsin

Milwaukee, Wis.—The Studebaker Automobile Company, of South Bend, Ind., has established a branch here. The company has leased the entire first floor of the Colby-Abbot Building, Milwaukee and Mason streets, Milwaukee, and William F. Sanger has been appointed general manager. A temporary branch was located in the garage of the Sanger Automobile Company, at 572-574 Farwell avenue, several weeks ago. The Colby & Abbot Building is one of the largest and finest office buildings in Milwaukee. It was remodeled at a cost of \$75,000 only three years ago.

Sheboygan, Wis.—G. A. Wilke, who has conducted a garage and agency for several years on Jefferson avenue, is building a branch garage, to be devoted exclusively to his electric business, on Center avenue and North Seventh street. The old garage will handle all gasoline business. The new garage will be equipped with a complete recharging station.

Waukesha, Wis.—Schober Brothers & Co. are erecting a 40x90 foot, brick and stone, one story garage and repair shop.

### Pennsylvania Company Increases Capital,

The Pennsylvania Auto-Motor Company, of Bryn Mawr, Pa., have filed notice with the State Department at Harrisburg, Pa., of an increase in capital stock from \$300,000 to \$500,000.

### The James & Browne Spring Drive.

This old established British firm, located at London, have recently brought out a 5 ton truck fitted with a novel spring drive, a description of which we take from the Commercial Motor.

As shown by the drawing, cast steel arms bear on their extremities spherical sock-

The "J. and B." spring drive.

ets, which carry adjustable spindles, and these, by means of strong square section helical springs, serve to keep the arms apart at a definite distance until such time as shocks, through unreasonable use of the clutch or brakes, are to be transmitted through the driving gear.

### No German Show in 1910.

The German Automobile Manufacturers' Association, in session at Berlin on December 1, decided not to hold an automobile

show in Berlin or elsewhere in Germany during 1910, and not to take part in the several small shows (Leipsic, Frankfort, Bremen) which are to be held next year. The question of exhibiting at foreign shows was brought up, and it was decided not to restrict members in this respect. A committee of seven members was appointed to devise ways and means to overcome the commission evil, which is said to have become very acute since the going into effect of the new law concerning unfair competition, with its "graft" provision.

### Number of Automobiles in Great Britain.

The Royal A. C. of Great Britain and Ireland has just compiled from the registration figures of the different counties throughout the United Kingdom the number of cars of various kinds registered in that country during the year which ended September 30, 1909. The following table shows these figures, together with the figures for the previous year and the increase in each item:

			-Increase.		
			Num-	Per	
	1908.	1909.	ber.	Cent	
Private motor cars.	71,405	84,840	13.435	18.8	
Trade motor cars	12,104	15,181	3.077	25.4	
Public service cars.	5,880	8,752	2.870	48.8	
Total cars	89.389	108,773	19,384	21.7	
Motor cycles	65,026	75,000	9-974	15.3	

Grand total....154,415 183,773 29,358 19.0 The above figures show clearly the trend of the industry in the direction of commercial applications. The heavy increase in public service vehicles is particularly noticeable. Drivers' licenses were issued to the number of 148.974 in 1908 and 174.986 in 700), an increase of 17.5 per cent.

### New Two Cycle Motor.

George Holloway, of Sandusky, Ohio, formerly superintendent of the Elmore Manufacturing Company's plant. has brought out and will place on the market a new two cycle engine, which will be built both in automobile and marine types. The engine is claimed to give more power for given cylinder dimensions than is obtainable from the conventional construction. A two cylinder motor of 4 inch bore and 4 inch stroke is said to have developed 17 horse power on the brake. The engine differs from other engines operating on the two cycle principle in that there are two separate sets of intake pipes and ports leading to the crank case. For ordinary speeds of operation only one oi these sets is used, but when extreme speed or power is desired, both sets of passages are thrown in operation, whereby a more complete charge is taken into the crank case. Patents on the construction have been applied for in this country and abroad.

The Valley Falls (R. I.) Fire District, at a meeting held on December 6, voted to purchase a motor propelled fire truck, which will probably be the first motor propelled fire apparatus in the State.

# NOTES OF THE INDUSTRY AND THE SPORT.

The Dixie Motor Works, Jackson, Tenn., are erecting a 40x100 foot building on Poplar street, which will be ready for occupancy about the first of the year.

L. J. Kaestner, of Plymouth, Wis., and the Holloway Automobile Company, of Monroe, Wis., are establishing automobile repair shops at this time.

The firm of Carpenter & Volkhardt, manufacturers of storage batteries at 2441 Michigan avenue, Chicago, has dissolved partnership. J. M. Volkhardt will continue the business.

The Olds Motor Works, of Lansing, Mich., are reported to be employing 1,054 men at the present time. The plans for next year call for 1,500 four cylinder cars and 500 six cylinder.

The list of exhibitors at the Madison Square Garden Show, printed elsewhere in this issue, shows a total of 323 different displays, of which 54 are exhibits of complete cars, 23 of motorcycles and 246 of accessories and parts.

The Reliance Motor Truck Company, of Owosso, Mich., have secured a tract of about 20 acres on which it is planned to erect a new building early in 1910. The capacity of the company will be doubled when this plant is completed.

The Chicago Auto Top Company has been organized to manufacture automobile tops, dust hoods, slip covers and trimmings, and has secured a factory and office at 1507 Michigan avenue. A repair department will be connected with the plant.

The Imperial Automobile Company, of Jackson, Mich., for whom a four story, 102x 132 foot factory building is at present being erected on East Washington street, plan to turn out three models for next year at \$1,350, \$1,650 and \$2,000, respectively.

The Colburn Automobile Company, who have been building automobiles in Denver, Col., in a small way for some years, have decided upon the erection of a \$60,000 factory and an output of 500 cars for next year. The factory will probably be located near Overland Park.

The Badger Brass Company, Kenosha, Wis., have added several new wings to their building, giving them considerably more floor space and enabling them to enlarge their output to an appreciable extent. They are also negotiating for the purchase of other properties adjoining their present site to still further enlarge their plant.

The Maxwell-Briscoe Motor Company, Tarrytown, N. Y., have added one more model to their 1910 line, known as the "Q 4 Sportsman." This car was originally built for the use of the company's various branch houses for competition in local races, hill climbs and endurance runs. It appealed to a large number of buyers, however, and was therefore included in the regular line

for next year. Its specifications are the same as those of the other two models recently described in these columns, and the price is \$1,000.

The Standard Connecting Rod Company, Beaver Falls, Pa., have purchased a number of properties in the vicinity of their factory, and will erect an addition to their plant.

The Hartford Rubber Works Company, of Hartford, Conn., have leased a building at 709 East Fifteenth street, Kansas City, Mo., where they will open a branch distributing house for the entire West.

The Western branch of the Willard Storage Battery Company will be moved on December 15 to 320 Dearborn street, where a complete line of storage batteries and supplies will be kept on hand and repair facilities be installed.

The Remy Electric Company, Anderson, Ind., have established a branch distributing office at San Francisco, Cal., where a full line of their magnetos, fittings and parts will be carried in stock. The branch is located at 170 Golden Gate avenue.

The Rushmore Dynamo Works have recently placed agencies for the sale of their lamps and generators in Berlin, St. Petersburg, Riga and Christiania. They have also opened branch stores in No. 1 Crow street, Dublin, and 33 Victoria Building, Deansgate, Manchester.

According to newspaper dispatches from Los Angeles, Cal., plans are maturing there for the construction of a saucer shaped motordrome, with a track built of heavy timbers and planked with finished lumber. The banking all the way around will be calculated to permit of speeds of 2 miles per minute

The "Simplex" oil and grease injector, invented by Raymond C. Agner, of Burlington, Wis., will be produced on an extensive scale, now that patents have been obtained. The Raymond C. Agner Company, recently organized to manufacture the device, intends to build a factory at Burlington early next year.

According to the latest announcement of the Maxwell-Briscoe Motor Company, they will manufacture 16,000 cars at their four plants. The 30 horse power cars are produced at Kingsland Point, N. Y.; the 22 horse power cars at Providence, R. I., and the 12 horse power runabouts at Newcastle, Ind. The bodies, wheels and fittings come from the Tarrytown factory.

The Belmont Automobile Company, a New York corporation, have secured a factory at 1040 State street, New Haven, Conn. The car to be built will be known as the Belmont 30, and will be made in baby tonneau and five passenger touring car types. The company has been operating in New York for about a year. The officers are:

C. B. Tyler, president; A. L. Kull and Douglas Hamilton.

Waterhouse & Lester, San Francisco, Cal., are inaugurating a motor supply department in charge of Eugene De Prez, formerly with the Neustadt Company.

The Cream City Trimming Company, manufacturer of automobile tops, Milwaukee, Wis., are erecting a new plant at 613-615 Market street, in Milwaukee.

The Boston, Mass., branch of the Columbia Lubricants Company, manufacturers of Monogram oils, has removed from 35 Hartford street to new, spacious quarters at 1000 Boylston street.

The Duplex Coil Company, of Fond du Lac, Wis., are preparing to build a large addition, following the decision of the directors to manufacture and market a new type of magneto under the "Duplex" trade mark. The new line will be taken up on January 15.

The first motor truck produced by the Schaefer Company, of Berlin, Wis., is now undergoing exhaustive tests. The company recently awarded contracts for an addition to its machine shops and foundry, doubling the capacity in order to take up the manufacture of trucks,

The Fourth Annual Pittsburg Automobile Show will be held at Duquesne Garden, March 26 to April 2, 1910, under the auspices of the Automobile Dealers' Association of Pittsburg, Inc. The show committee consists of Frank D. Saupp, chairman; G. P. Moore and James R. Newell.

The General Motors Company have bought an extensive tract of land in Detroit, Mich., on which they plan to erect a parts factory, and have approached the city council with the request to close certain streets and alleys running through the property. The matter has been referred by the council to the joint committee on streets and street openings.

Capitalists of Rochester, N. Y., held a meeting in the Masonic Club Rooms, on December 6 to consider a plan for organizing a stock company to manufacture automobiles. About \$20,000 worth of stock was subscribed for, and a date for another meeting this week was set. The plan is said to be the outcome of a proposition from a newly organized Detroit company to locate in Rochester, which proposition was turned down by Rochester interests.

Citizens of Greenfield, Ind., are attempting to secure the factory of the Leader Automobile Company, now located at Knightstown. The company was formerly known as the Columbia Electric Company, and manufactures a line of gasoline cars. Luther R. Frost, manager and one of the heaviest stockholders in the company, lives in Greenfield, and has stated that it citizens of that

city will subscribe for sufficient stock the factory will be moved.

Business men of Port Arthur, Tex., are considering a plan to establish an automobile factory in that city. J. Ormrod, a promoter, of Houston, is interesting local capitalists in the plan.

The Baldwin Chain and Manufacturing Company, of Worcester, Mass., are erecting a building at the rear of their present factory at 199 Chandler street, which will give them 10,000 square feet additional floor space. The building will be ready for occupancy on January 1.

Albert Schenk, of Wheeling, W. Va., has invented a non-skid device said to be particularly applicable to motor trucks, and is now planning to organize the Packers Auto Truck Company, which will be incorporated with a capital stock of \$1,000,000, under West Virginia laws and will locate in Pittsburg.

The Jackson Automobile Company, of Jackson, Mich., recently completed four new factory buildings. The largest building is a three story structure, 227x60 feet, and will be used entirely for body construction. Another three story building, measuring 145x60 feet, will be used for the painting and finishing department, and the third building, two stories high and measuring 200x60 feet, will form an addition to the machine shop. The fourth building is a one story structure, 100x60 feet, and will be used as a testing room. The total floor space of these four buildings is 120,000 square feet.

#### Club Notes.

The Wyoming Motor Cycle Club was organized at Cheyenne on November 30, with the following officers: W. S. Lee, president; W. A. Wilson, vice president; Fred Boyer, secretary, and E. B. Love, treasurer. The club plans to affiliate with the Federation of American Motor Cyclists.

The Baton Rouge (La.) A. A. was organized at a recent meeting in the office of Dr. Charles McVea, with the following temporary officers: Dr. Chas. McVea, president; W. M. Barrow, secretary. Resolutions were adopted endorsing the ordinance recently passed by the city council regulating the speed of automobiles.

The Quincy (Ill.) A. C. at a meeting held at the Newcombe Hotel on December 6 passed a resolution urging the city authorities to immediately start work on the improvement of the paved streets, in both the business and residence sections, and not to permit tearing up the streets without exacting proper guarantees that the pavement will be relaid in a proper manner.

The Wilkes-Barre (Pa.) A. C. at a meeting held on December 3 received the resignation of President James H. Hughes, and decided to henceforth hold their annual election in January instead of in April. The committee in charge of last year's hill climb made a report showing that the receipts amounted to \$3,771.13, and the expenditures

to \$4,442.42. The difference is to be paid out of the club's treasury.

The touring cup presented to the Long Island A. C., by D. C. Lefferts, has been awarded to Wm. C. Wintringham, who toured in thirteen different States during the past year.

The A. C. of New Rochelle, N. Y., has adopted resolutions condemning the action of Policeman Arthur Sutton, of White Plains, N. Y., in shooting at the automobile of Harvey Husted, of White Plains, in North avenue. The resolution was forwarded to the police commissioners of White Plains, and a hearing will be given Sutton on December 13.

The Dayton (Ohio) A. C. was organized at a meeting held at the Algonquin Hotel on November 30, and will affiliate with the Ohio State A. A. According to the resignation records, there are 725 automobile owners in the city, but only fifty joined the club as charter members. Carroll D. Sprague was elected temporary president, and an election of permanent officers will be held in the near future.

The automobile drivers of Spokane, Wash., have recently organized under the name of the Spokane Chauffeurs' Club, the following officers being elected: Tom W. Evans, president; John A. Halstead, treasurer; Harry R. Anderson, secretary. It was determined at the meeting that only men who have had at least two years' road experience as drivers and can pass a rigid automobile machinist's examination shall be eligible as members of the club.

The Mt. Vernon (N. Y.) A. C. held its annual meeting on December 6. E. H. Patterson talked on his experiences in motoring in this country and abroad. The following officers were elected: Wm. H. Mendell, president; Chas. B. Philips, vice president; L. A. Kissling, recording secretary; Otto F. Rost, financial secretary, and Anthony H. Seitz, treasurer. The new officers will be installed at a meeting to be held on January 7.

The Chicago Motor Club held its annual election at the new Southern Hotel on December 7. The following officers were elected: David Beecroft, president; Thos. J. Hay, first vice president; Louis Geyler, second vice president; F. H. Trego, secretary, and H. T. Clinton, treasurer. The new directors of the club plan to reduce the annual dues from \$12 to \$5, to enlarge the club headquarters and to co-operate with the automobile clubs in the State in the interest of better legislation and good roads.

Racing Notes.

It is reported that the Manufacturers' Contest Association has received requests for sanctions for 110 different race meets for next season.

The Century Motor Club, of Philadelphia, will hold a road-ability run from Philadelphia to Wilmington, Del., and back on New Year's day. The outward route will be by way of Westchester and Oxford, and the return route will lead through Chester,

Media, Phœnixville, Norristown and Doylestown. Checkers will be stationed in each town.

In the account of the Edgewater-Fort Lee hill climb, in our last issue, Chapple's time on an Indian motorcycle was given as 0:50.15, but which according to the official time record was 1:02.18.

The latest automobile track project is reported from Lincoln, Neb., where J. A. Buckstaff is planning to build a 4½ mile track around Capital Beach Lake, as close to the shore of the lake as possible.

According to W. J. Morgan, who has been the promoter of the Ormond-Daytona Beach races in past years, these races will not be held the present winter, as they have not been financially successful in recent years.

The Quaker City Motor Club, of Philadelphia, has abandoned its annual midwinter endurance run, which was to be held on December 29-30. The decision was arrived at as the result of the inclement weather during last year's run.

The entries for the French Grand Prix for 1910 closed on November 30. Only thirty-six entries were received, and as the committee in charge deems forty-five necessary in order to justify the organization of the race, it is very likely that the classic event will not be held next year.

The Chicago Motor Club plans to hold record trials on a one mile straightaway course in the vicinity of that city some time during Christmas week, if the weather permits. C. E. Gregory and E. A. Hearn have been appointed a committee to select a suitable course. Lewis Strang and E. A. Hearn will attempt to break the world's records in the big Fiat racer recently imported into this country and a Fiat stock car respectively.

#### New Incorporations.

The Iowa Motor Truck Company, Des Moines, Ia.—Capital stock, \$25,000. Incorporators, P. E. Coffee and others.

The Brady Auto Company, Austin, Tex.—Capital stock, \$20,000. Incorporators, D. F. Savage, W. D. Crothers and J. E. Thompson.

Magnolia Motor Company, Houston, Tex.—Capital stock, \$10,000. Incorporators, James L. Autrey, W. B. Sharp, G. R. Spotts and others.

The Apperson Motor Car Company of Chicago, Chicago, Ill.—Capital stock, \$2,500. Incorporators, Elmer Apperson, E. L. Apperson and Alton G. Seeberling.

The Nyberg Auto Company, Dover, Del.—Capital stock, \$150,000. Incorporators, Eric Kulberger, F. G. W. Steiber and E. W. Jenkins, all of Chicago, Ill.

The Gentilly Automobile Company, New Orleans, La.—Capital stock, \$30,000. Incorporators, R. E. Edgar de Monthuzzin, M. A. Baccich and Ed. L. Lafaye.

The Texas Automobile Association, Houston, Tex.—No capital stock. Incorporators, Capt. J. W. Munn, of Galveston;

G. W. Hawkins, E. J. Keist, of Houston,

The R. L. Morgan Company, Worcester, Mass.—Capital increased to \$1,000,000.

Reynolds Motor Company, Detroit, Mich. -Capital stock, \$40,000. Incorporators, A. Reynolds and others.

The West Motor Car Company, Wilmington, Ohio.-Capital stock, \$10,000. Incorporators, James M. West and others.

The Waco Auto and Supply Company, Waco, Tex.-Capital stock, \$7,000, Incorporators, Geo. Roper, Jr. and B. A. Hayes.

The American Motor and Supply Company, Shelby, Ohio.-Capital stock, \$25,000. Incorporated by J. W. Williams and others.

The Highland Garage, Tarrytown, N. Y. -Capital stock, \$10,000. Incorporators, D. S. McElroy, Jr., James Bailey and Chas.

The White Auto Company, Enid, Tex .-Capital stock, \$100,000. Incorporators, R. Kennedy, J. R. Clover, J. R. Dunworth and H. E. Louthan.

The Light Motor Wagon Company, Milwaukee, Wis.-Capital stock, \$10,000. Incorporators, B. E. Malone, O. R. Kaddatz and H. A. Richards.

The East Side Automobile Company, Portland, Ore.-Capital stock, \$10,000. Incorporators, Alma Williams, James Mitchell and J. H. Williams.

The Washington Taxicab Company, Spokane, Wash.-Capital stock, \$200,000. Incorporators, A. E. Gallagher, Nathan Toklas and Harry I. Broh.

The Acme Auto Wind Shield and Top Company, Indianapolis, Ind.—Capital stock, \$5,000. Incorporators, O. H. Rogers, J. L. Burch and J. E. Sickels.

The Auto Wheel Company, Lansing, Mich.-Capital stock, \$150,000. Incorporators, E. S. Porter, H. E. Bradner, H. T. Campbell, J. C. Watzell, Lawrence Price, F. E. Platt and Jacob Gansley.

The Tri-State Auto and Machine Company, Keokuk, Ia.-Capital stock, \$10,000. Incorporators, R. B. Meek, J. T. Erickson, E. A. Larson and A. E. Erickson.

The Fisher Automobile Company, Cherokee, Okla.-Capital stock, \$5,000. Incorporators, A. H. Stout, F. J. Salisbury, John W. Pickrell and George Salisbury.

The Nielson Motor Car Company, Detroit, Mich.-Capital stock, \$50,000. Incorporators, Charles J. Woodward, Benj. A. Welstead and Edward L. Webb.

The Albemarle Rapid Motor Transfer Company (Inc.), Charlottesville, Va.-Capital stock increased from \$5,000 to \$25,000. To conduct an automobile business.

The Gillespie Auto Sales Company, Detroit, Mich.-Capital stock, \$25,000. Incorporators, John Gillespie, D. P. Markey, D. H. Gillespie and Ralph S. Merriam.

The Enterprise Machine and Garage Company, Franklin, Ky.-Capital stock, \$10,000. Incorporators, W. H. Windfield, H. M. Mullinx, J. O. Turner and B. Harris.

The American Auto Company, Columbus, Ohio.-Capital stock, \$3,000. Incorporators, William Bucher, C. W. Cain, Laura

The White Auto Company of Enid, Okla. -Capital stock, \$10,000. Incorporators, R. Kennedy, William Kennedy and J. R.

The Stutz Auto Parts Company, Indianapolis, Ind.-Capital stock, \$10,000. Incorporators, H. F. Campbell, H. C. Stutz and C. E. Stutz.

Twin City Motor Car Company, St. Paul, Minn.-Capital stock, \$200,000. Incorporators, Fred Joerns, Wm. Thiem and Edward A. Thiem.

The Standard Automobile Company, Wheeling, W. Va.-Capital stock, \$25,000. Incorporators, E. J. Becker, Geo. W. Row, C. E. Morris, H. L. Arbenz and Albert L. Lohm.

The Stafford Motor Car Company, Kansas City, Mo.-Capital stock, \$100,000. Incorporators, Terry Stafford, C. L. Merry, W. G. Whitcomb, C. E. Hoefer and F. C. Merry.

The Syracuse Specialty Company, Syracuse, N. Y.-Capital stock, \$10,000. Incorporators, Duncan W. Peck, W. D. Hawley and Thomas H. Harvey. To manufacture motors, etc.

The Enterprise Garage Company, Brooklyn, N. Y .- Capital stock, \$25,000. Incorporators, F. A. Sands and Neil Campbell, of Brooklyn, and J. Robert Rubin, of Manhattan.

The Standard Motor Car Company, Wheeling, W. Va.-Capital stock, \$25,000. Incorporators, Thomas W. Norton, J. F. Ranson, Frank O'Brien, E. E. Shaffer and George A. Blackford.

The Andrew Motor Company, Newcastle, Ind.-Capital stock, \$3,000. Incorporators, J. D. Smith, H. E. Jennings, H. C. Yauky, W. C. Bond, H. F. Burk, D. W. Kinsey and H. C. Chase.

#### Trade Personals.

George E. Sherman has been appointed advertising manager of the Holsman Automobile Company, Monadnock Building, Chicago, Ill.

E. S. Leonard, formerly in charge of the Ajax tire branch in Portland, has been transferred to Seattle, where he will look after the sales of the Seattle office.

A. C. Stevens, for the past year superintendent of the Seattle Taxicab Company, has severed his connection with that company, and has secured the agency for the Stearns car in Seattle, Wash.

C. G. Wridgway, who was formerly manager of the Peerless branch in this city, has returned from Europe, where he went after resigning from that position, and states that he plans to engage in the business of exporting American cars.

F. R. Bump, sales manager of the H. H. Franklin Manufacturing Company, has returned from a two weeks' trip through the South. On his journey he visited Franklin motor car dealers in Jacksonville, Fla.; Savannah, Ga.; Atlanta, Ga.; Green-

B. Levering, W. S. Siebert and J. H. ville, S. C.; Charlotte, N. C.; Richmond, Va.; Washington, D. C.; Baltimore, Md., and Philadelphia, Pa.

A. H. Whiting, manager of the New York branch of the Dayton Motor Car Company for the past several years, has severed his connection with that company.

Frank Fanning, formerly a member of the Chalmers-Fanning Motor Company, of Philadelphia, Pa., has been appointed manager of the Philadelphia agency for the Mercer car, made in Trenton, N. J.

William R. Everitt, formerly president of the Sterling Machine Works, Sterling, Ill., has been appointed vice president and secretary of the Nyberg Automobile Works, 2437 Michigan avenue, Chicago.

W. J. Mead, formerly connected with the Buick branch in Chicago, is now secretary and general manager of the Olds Motor Works, Lansing, Mich.; he is also vice president of the General Motors Company.

Harry E. Fields, vice president of the Hartford Rubber Company, has started on a Western trip, in the course of which he will visit Denver, Los Angeles, San Francisco and Seattle. He will return about Christmas.

Robert Pierpont has succeeded R. R. Owen as factory manager at the plant of the Olds Motor Works, Lansing, Mich. Mr. Pierpont has been connected with the Buick Company at its Flint and Jackson plants for a number of years.

Thomas F. Smith, of Chicago, has been appointed general manager of the new Milwaukee branch of the Studebaker Automobile Company, in the Colby-Abbott Building. William F. Sanger, of the Sanger Automobile Company, is sales manager.

#### Stearns Wins Los Angeles Six Hour Race.

A Stearns car driven by Soules won the six hour race at Ascot Park, Los Angeles, on December 13, covering 293 miles. A Pullman, driven by George Kussman, was second, with 251 miles, and a Buick was third, with 249 miles. The event was marred by numerous accidents to cars and serious injuries to participants. In the fifty-second mile the Apperson Jack Rabbit, with Harris Hanshue at the wheel, turned over three times on a sharp turn. Neither Hanshue nor his mechanician was injured.

The Cadillac and Sunset also overturned at the same spot.

The Philadelphia Automobile Company have decreased their capital stock from \$20,-000 to \$5,000.

How widespread technical interest and experimentation in the navigation of the air are becoming is shown by a statement of the H. H. Franklin Manufacturing Company of Syracuse, maker of the Franklin automobile. That company is receiving on an average two inquiries a week regarding the availability of the Franklin air cooled engine for use in aviation.

### MOTOR VEHICLE PATENTS.

Patents Issued September 14, 1909.

933,735. Roller Bearing.—Lincoln J. Aldridge, Plattaburg, N. Y., assignor to Aldridge Roller Bearing Manufacturing Co., a corporation of New York. Filed January 5, 1909.

933,748. Tire Protector .- Dufferin Day, Hume,

Ohio. Filed May 11, 1908. 933,807. Spring Wheel.—Henry J. Wildhagen, Palatine, Ill. Filed September 1, 1908.

933,868. Combined Press and Vulcanizer. K. Williams, Akron, Ohio, assignor of one-half to the Williams Foundry and Machine Co., a corporation of Ohio. Filed January 17, 1908.

933,870. Change Speed Gearing.—Austin M. Wolf, New York, N. Y. Filed November 13, 1908. y33,877. Oil Can.—Robert H. Booth, Monmouth, Ill. Filed April 17, 1909.

933,960. Internal Combustion Engine.-David H. Coles, Brooklyn, N. Y. Filed October 16, 1908. 933,997. Suspension Spring System for Automobiles.—Charles A. Lieb, New York, N. Y. Filed

December 3, 1908. 934,016. Transmission Gear for Automobiles and Other Machinery.-Lewis T. Rhoades, Phoenixville, Pa. Filed January 3, 1908.

Coupling for Power Transmission in 934.043. Motor Vehicles.-Howard E, Coffin, Detroit, Mich., assignor to Chalmers-Detroit Motor Co., Detroit, Mich., a corporation of Michigan. Filed November 6, 1908.

934,067. Front Axle Connection for Vehicles.— Arthur J. Goyette, Springfield, Mass., assignor to Thomas E. Daly, Springfield, Mass. Filed July 30, 1908.

934,117. Drive Gear for Motor Vehicles.—John . Welton, Canal Dover, Ohio. Filed October 28. 1908.

934,144. Steering Gear for Vehicles.—Eugene N. Daniels, La Fargeville, N. Y. Filed June 12, 1008.

934,159. Spring Wheel.-Fred N. Gibb, Little

934,164. Adjustable Crank for Internal Combustion Engines.—Conrad J. Gotti, Tuckahoe, N. Y. Filed February 16, 1909.

Vehicle Wheel.-Lewis Inglee and 934,178. Charles M. Hart, Amityville, N. Y. Filed August 12. 1008.

934,187. Detachable Wheel Rim .- Carl Kindscherf, Hanover, Germany, assigner to the firm of Continental Caoutchouc and Gutta Percha Compagnie, Hanover, Germany. Filed June 30, 1908. 934,238. Cultivator (Motor Propelled).—Nathan

Tripp, Grand Rapids, Mich. Filed December 2, 1908.

014.264. Friction Clutch Mechanism for Automobiles and for Other Applications.-Alberto Balloca, Turin, Italy, assignor to Company Itala, Fabbrica di Automobili, Turin, Italy. Filed January

Wheel for Road Vehicles.-Glencairn S. Ogilvie, Woodbridge, England. Filed June 28, 1007.

934,348. Chain Tightener.-Charles H. Peterson, Westbrook, Me. Filed March 6, 1909.

934,416. Wheel for Motor Cars, Etc.—Glencairn S. Ogilvie, Woodbridge, England. Original application filed August 3, 1903, Serial No. 168,094. Divided and this application filed June 28, 1904.

#### Patents Issued September 21.

934,425. Braking Mechanism.—James P. Callahan, Chicago, Ill. Filed February 8, 1909.

934,427. Spark Plug for Gas Engines .- David H. Coles, Brooklyn, N. Y. Filed March 20, 1909. 934,461. Tire Tool.-Herbert J. Phillips, Bays-

water, London, England. Filed June 24, 1908. 934,505. Change Speed Gearing.—Charles Cotta, Rockford, Ill., assignor to Cotta Transmission Co., Inc., Rockford, Ill. Filed June 7, 1906.

934,547. Braking Means for Automobile Ve-

hicles.-Arthur Krebs, Paris, France, assignor to La Société Anonyme des Anciens Etablissements Panhard et Levassor, Paris, France. Filed February 15, 1908.

Radiator for Automobiles. Todd, Chicago, Ill., assignor to Joseph B. Long, Chicago, Ill. Filed August 30, 1907.

934.597. Clutch for Concentric Rotary Parts.— Frederick S. Ellett, Elmira, N. Y. Filed June 7,

934,621. Roller Bearing.-John Newmann, Brooklyn, N. Y. Filed April 15, 1909.

934,639. Tire.-Victor E. Van Cantfort, Akron, Ohio. Filed April 18, 1908.

Valve Reseating Tool.—Thomas B. 934,642. Williams, Orange, Mass., assignor to the Leavitt Machine Company, Orange, Mass. Filed March 12, 1909.

Crank Case for Engines.-- John P. 934.675. Landgraf, Mishawaka, Ind. Filed April 17, 1909. 934,680. Protecting Device for Explosion Engines .- Julius Lengel, West Philadelphia, Pa. Filed December 9, 1908.

934,685. Propelling Gear for Trucks.-George A. Mickelson, Spokane, Wash. Filed April 20, 1909.

Spark Distributor .- Edouard Denie-034.715. port, Paris, France. Filed September 30, 1908.

934,716. Variable Speed and Reversing Gear.— Frank W. Dodd, Rodwell, Weymouth, England. Filed April 24, 1908.

934,750. Valve Gear .- Thomas O'Brien. New York, N. Y. Filed February 24, 1908. 934,762. Valve Gear for Descending Automo-

biles.-Hippolyt Saurer, Arbon, Switzerland. Filed August 28, 1905.

934,842. Sparker Mechanism for Internal Combustion Engines.—Henry Schaake and John T. Cowie, New Westminster, British Columbia, Canada. Filed July 27, 1908.

934,912. Hauling Motor.-Harold A. Heavey, Paskenta, Cal. Filed November 26, 1906.

934,925. Wheel Guard.—George W. Mahan, Cold Spring Harbor, N. Y. Filed November 19, 1908.

934,978. Sparking Mechanism.-Roy C. Marks, San Diego, Cal., assignor of one-eighth to R. H. Gunnis, one-eighth to Oliver J. Winston, and oneeighth to W. W. Whitson, San Diego, Cal. Original application filed September 12, 1906. Serial No. 334,327. Divided and this application filed February 6, 1908.

#### Patents Issued September 28, 1909.

935,033. Vehicle Tire.-Clinton H. Knecht. Akron, Ohio. Filed August 26, 1908.

Variable Transmission Gear .- Johann 935,034. Knecht, Chemnitz, Germany. Filed September 8, 1908.

935,036. Gear Casing for Motor Vehicles.— John C. Lott, Columbia, S. C. Filed June 18,

Valve.-Lenn G. McCorry, Carbon

Center, Pa. Filed January 12, 1909. 935,048. Coupling for the Inflating Valves of Pneumatic Tires.—Charles McNellis, Chicago, Ill. Filed October 3, 1908.

935,108. Automobile Safety Appliance.—Mortimer A. Howe, Tacoma, Wash. Filed February 15,

935,190. Wind Screen.—Edwin K. Conover, Paterson, N. J., assignor, by mesne assignments, to C. A. Mezger, Incorporated, Brooklyn, N. Y., a corporation of New York. Filed November 26, 1907.

935,211. Motor Vehicle.-Allen Loomis, Detroit, Mich., assignor to Packard Motor Car Co., Detroit, Mich., a corporation of West Virginia. Filed January 2, 1908.

935,252. Storage Battery Electrode.-Louis H. Flanders, Wilkinsburg, Pa., assignor to the West-

inghouse Machine Co., a corporation of Pesselvania. Filed December 15, 1905. 935,276. Mud Guard for Vehicles.—Harold J.

Shrapnel, Brixton, England. Filed December 4. 1 90**8.** 

935,328. Sliding Gear Mechanism.—Henry M. Russell, Jr., Wheeling, W. Va. Filed May 14. 1000.

935,351. Gear Case.-George W. Bandy, Talla-

hassee, Fla. Filed April 16, 1909. 935,387. Gasket.—Charles I. E. Mastin, Paterson, N. J. Filed June 1, 1909.

935.437. Lamp Operating Mechanism.—Artemus R. Warfield and Joshua B. Nicholson, Wash-

ington, D. C. Filed December 23, 1908. 935,525. Shock Absorber.—William B. Knapp.

Stoneham, Mass., assignor to Knapp-Greenw Co., Boston, Mass., a corporation of Maine. Filed September 19, 1908.

935,582. Motor Vehicle.—Robert H. Bownen anon City, Col. Original application filed Octo Canon City, Col. ber 30, 1907. Divided and this application filed May 29, 1908.

935,583. Speedometer.—James H. Bullard and Edwin W. Bullard, Springfield, Mass., assignors to Bullard Specialty Co., Springfield, Mass., a corporation of Massachusetts. Filed December 21. 1906.

935,610. Steering Mechanism .-- August Maulach, near Tabor, S. Dak.; A. J. Wilcox, executor of said Mauksch, deceased. Filed November 2, 1907. 935,622. Shock Absorbing Wheel.—George F. Crass, Ithaca, N. Y., assignor of one-half to David Finkelstein, Ithaca, N. Y. Filed August 20,

13,024. Process for Preventing and Laying of Dust Through the Application to Roads or Real Material of an Aqueous Emulsion of Oil-William M. Sandison, Ashfield, Ayton, Scotland, ssignor of one-half to Herbert G. McKerrow, Newton, Mass. Filed February 18, 1908.

#### Patents Issued October 5, 1909.

935,644. Clutch.-Howard E. Coffin, Detrok, Mich., assignor to Chalmers-Detroit Motor Ca. Detroit, Mich., a corporation of Michigan. Flied November 6, 1908.

Carburetor.-William K. 935.833. Perth Amboy, N. J., assignor to J. P. Hall, East Orange, N. J. Filed November 24, 1908. 935,837. Valve for Pneumatic Tiren.—Fred T.

Clayton, Sandwich, Mass. Filed August 1, 190 935.882. Transmission Mechanism.-John W.R. Andrews, Leominster, Mass. Filed May 3, 1909.
935,909. Friction Clutch.—William A. E. Hen

rici, Boston, Mass. Filed January 25, 1901.
935,927. Automobile Brake Attachment. Reifsnyder, Canton, Ohio. Filed Neventor 11, 1907.

11, 1907.
935.931. High Tension Spark Plug.—John Sharp and William Sharp, Cleveland, Ohio. Find De cember 9, 1908.

935,948. Lubricator.-William O. Turner, Be mont, Tex. Filed June 16, 1908. Serial No. 436-709. Renewed September 1, 1909. 936,064. Carburetor.—Walter C. Westaway,

Rockford, Ill., assignor, by direct and mesne assignments, to J. W. Duntley, Chicago, Ill. Filed

September 28, 1005. 936,074. Electrically Operated Valve.-Warren W. Annable, Grand Rapids, Mich., assignor to the Starter Manufacturing Co., Grand Rapids, Mich, a corporation of Michigan. Filed April 26, 1909. 936,075. Automobile Protector. - David F. Ars-

strong, Groton, Conn. Filed October 22, 1908. 936,102. Clutch Mechanism.-Victor J. Emery,

Quincy, Mass. Filed April 13, 1906. 936,118. Carburetor.—George T. Glover, Chicago, Ill. Filed July 10, 1906.

936,190. Friction Clutch.-Charles Tuckfeld, East Molesey, England. Filed August 27, 1908.

# The Horseless Age

NEW YORK, DECEMBER 22, 1909

**NUMBER 25** 

### The Choice of a Lubricant.

By David L. Gallup.

In the selection of lubricating oil the average man must be guided for the most part by the advice of others, and as that usually comes from an agent or salesman, he is more often confused than enlightened. Many times he is overwhelmed by the arguments put forth by the salesman, who dilates upon the color of a particular oil and seeks to show what effect it has upon its lubricating properties; its low cold test; high flash and fire tests; how it is

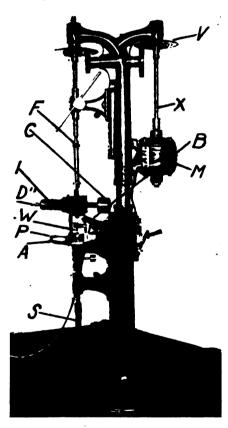

Fig. 1.—Kingsbury Oil Testing Machine. A, arc; B, Bunsen burner; C, counterbalance; F, flexible shaft; I, index; M, motor; P, pointer; S, auxiliary spring; V, variable speed.

manufactured from the purest stock obtainable; mentions its specific gravity; and draws attention to its viscosity."

To be plain for a minute, what does the average man know about "viscosity," and what cares he so long as the oil lubricates his engines properly and requires the minimum of attention? To be sure, these features are very often indicative of the characteristics of an oil, and are of immeasurable value when used in the right place

and by the right men, who know exactly what they mean; but the point to be emphasized is that the possession of any one or two of these is not positive proof that the lubricant will lubricate. Many an oil has a high flash and fire test, but fails when in a cylinder. Others have light color, and still others have dark color, and apparently both are successful. How, then, can the best oil be determined? Unfortunately, the general public have neither the time nor the facilities for the determination of the qualities of an oil, so this must be left to those possessing the necessary apparatus and the ability to obtain impartial results.

With these ideas in mind, and also the fact that apparently little information is available, the Department of Mechanical Engineering of the Worcester Polytechnic Institute has fitted out a laboratory for the complete testing of the properties of various oils, and in particular the lubricating qualities of the same when subjected to

conditions duplicating those in practice. The piece of apparatus used for this latter purpose is of considerable value. and will be described at some length, as it is novel in construction and not in common use. The other pieces of apparatus, such as for determining the "cold test," "flash" and "fire" test, "viscosity," etc., being simple in construction, and also well known, no description will be attempted. The particular machine referred to is known as the "Kingsbury oil testing machine," and was designed by Prof. Albert Kingsbury, for some years professor of applied mechanics at the Worcester Polytechnic Institute. The accompanying illustrations (Figs. 1 and 2) will aid in the description.

THE KINGSBURY OIL TESTING MACHINE.

A is a steel journal fitting between two brasses B, which are contained in the receptacle R. and in which the oil to be tested is placed. The two brasses are forced together by means of the screw S, which is en-

closed in the portion indicated. C is the nut by which the compression of the screw may be adjusted, and D is the handle which controls the throwing on or off of the load without in any way disturbing the adjustment of the screw S. E is a counterbalance. The frame indicated by F is supported vertically by a small wire W from the point O, and being balanced by E, so that the wire is always vertical, hangs in such a manner that there is no contact which might offer frictional resistance to the turning of the frame F. When rotation of the journal A takes place, a twist (the amount depending upon the speed of rotation, pressure between the brasses and journal, and the frictional qualities of the oil) occurs in the wire and the pointer P gives accurate indication of the friction due to the oil under the conditions then existing. The wire is the only thing which prevents the rotation of the frame F. For oils which have a high coefficient of friction, and are beyond the capacity of the

i. 3.

general way the flash point. This is to be expected, for when the flash point of the oil is reached the constituent parts are broken up and the lubricating qualities of

the oil are destroyed.

coil spring H may be brought into action.

The journal is driven by a motor attached to the shaft, as indicated, and interposed between the journal and motor shaft is the variable speed device designed and patented by the Washburn Shops of the W. P. I. By means of this, and also a planetary gear device not shown, but inserted at X in place of the regular shaft, a

natural spring of the wire W, an auxiliary

variation in speed may be obtained ranging from a given number of revolutions per minute to sixteen times as great.

CONDITIONS OF TEST.

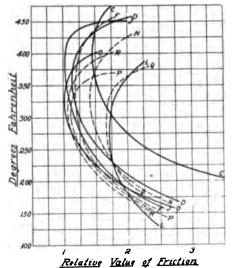

From the above description it is evident that an oil may be tested under any condition of temperature, pressure or speed of rotation, varying any one condition or all at will, and since all the conditions which occur in the automobile engine may be included under these three, the value of the apparatus is self evident.

In these tests great stress was laid upon the results as shown by this piece of apparatus, for although the flash, fire, cold, viscosity, etc., tests may be of considerable interest, the real value of an oil centres around the question of what it will actually do in a motor. Various oils, including the best, some good, a few indifferent, and a whole lot bad, were tested under certain conditions of speed, pressure and temperature, and the results for a number of them plotted in the form of curves. Fig. 3 is a typical example of results of tests made on an oil showing the change in the value of the coefficient of friction under varying temperatures, something which is very well explained in a paper by Professor Kingsbury before the A. S. M. E. (Trans. A. S. M. E., Vol. 24), and to which the reader is referred. It is readily seen how the changing of the temperature affects the frictional qualities of the oil, this being brought about by a change in the relative viscosity. Again, when the temperature has reached, in this case, 225 degrees, the coefficient of friction begins to increase, showing that above that the oil quickly loses its value as a lubricant. This upper point will vary somewhat under different conditions of pressure and speed, but approaches in a

Right here attention is called to the subsequent curves representing the results of tests, and in which the term "relative value of friction" is used. This is done in order to do away with calculations which would be necessary in case the coefficient of friction was desired, and also to obviate the possibility of any dispute or argument which might arise as to the actual value of this coefficient, the latter being affected by local conditions in the bearing itself, but the effects of which are eliminated by the use of the term mentioned, since it refers merely to a comparison of oils under exactly the same conditions. These curves also show very clearly how various conditions may be met.

VALUE OF APPARATUS AS BASIS FOR COMPARISON.

One of the chief characteristics of this particular piece of apparatus is what might be termed its "consistency" of performance. It is not meant by this that if the machine

Rubbing velocity, 300 feet per minute; pressure, 175 pounds per square inch.

Fig. 5.

be adjusted for a certain set of conditions, and certain values of coefficient are determined, that at the end of a year's time it will give exactly the same values for (apparently) the same set of conditions, for, as indicated above, the surface of the bearing will change in the course of time. However, when tests are made, one after another the results are absolutely accurate To prevent any possibility of doubt, one particular oil may be used as a standard, and tested often enough to check up any change which may be taking place in the bearing. It is safe to assume that a given specimen of oil will always bear the same relation to its neighbors.

Fig. 4.

To illustrate the sensitiveness of the machine an incident may be cited: A local engineer some time ago submitted two samples of oil to be tested for comparison, one known to be standard, but more expensive than the second. It was his purpose to discover if under the conditions of operation with which he was dealing the second oil would serve the purpose as well as the more expensive lubricant. Tests were made and curves of the results plotted, but it was discovered that there was no difference. There immediately arose a doubt as to the accuracy of the results, and so another sample was called for and tested, and exactly similar results were obtained. The engineer was acquainted with the facts of the case, and, of course, became convinced of the uselessness of the apparatus. It was with considerable relief to all concerned that information was received later that through carelessness on the part of his assistant two samples of the same oil had been submitted for test.

#### RESULTS.

In the tests which have been made various kinds of oils have been included, from the best to the poorest, but curves for only the better grades are shown. The oils are referred to by letter as A. B, C, etc. It is also to be noted that the conditions of speed, pressure, etc., are taken arbitrarily, but are perfectly good for purposes of comparison and illustration, especially so since the "characteristic" of all ordinary oils is practically the

same-hence deductions may be correctly drawn regarding their behavior under other conditions than those under consideration. Tables are given of the cost of the oils, flash, fire and viscosity tests. A few conclusions regarding the action of the oils may not be out of place, even though much is self evident from the curves. It will be noted (Fig. 5) that the actual difference in coefficient of friction of the various oils does not vary greatly at what might be termed low working temperatures in an automobile engine, say 300° Fahr. This is practically true in the case of all the oils except C, L, N and Q. However, this is not the important point. The real fact to be noted is the difference in the "minimum coefficient ranges" of the various oils. Starting at about 260° Fahr., they are very much alike, but along at 340° Fahr, some begin to show evidences of 'breaking up"; others at 380°, and the best (J) not till 430°. If the temperature range in the combustion chamber was always from 280 to 350° Fahr. there would be little object (other things being equal) in paying twice as much for one lubricant as for another, but when it is considered that especially in this type of engine the temperature varies between extreme limits the value of an oil like J is plainly seen. Some are fairly successful with a cheaper grade of oil, because either a large amount is used or the average running does not cause the egine to labor (in other words, it runs much of the time on low throttle), or the engine is more than amply cooled. (Reference will be made later on to the effect of too much oil.) The actual value of the coefficient of friction, as shown in oil J, is a trifle over 0.001, and even though the values of the coefficient for all of the oils shown in Fig. 5 are almost negligible, the fact that the friction for Q, for illustration, is nearly 75 per cent. greater than that for J points to a very great advantage of the latter over the former. Needless to say J is a more expensive

oil. Between P and J (Fig. 5) there is no appreciable difference in friction values, and as previously intimated there exists no reason for using the more expensive J in place of P when the temperature does not exceed 340°, but, as is well known, this is a "low" temperature in most automobile cylinders, and this, of course, gives the preference to J.

Another curve is shown (Fig. 6) giving results from three oils—I a standard make, 2 a well known oil, and 5 a mixture of the two (the mixture calculated to bring down the price of the better grade and to raise the lubricating qualities of the poorer). In the flash and fire tests no change is evident from the mixing, and this is easily understood, since the flash point is the temperature at which the more easily broken up portions of the oil begin to separate from the main body and take fire, and, of course, the mixture containing same constituents as the two component oils, it will break up at

Another point which is of considerable importance is illustrated in the comparison of which the results are shown in Fig. 7. The oil indicated as P possesses flash and fire points higher than P, yet under test the

lubricating qualities are inferior. This merely goes to show that while ordinarily high flash and fire points may indicate a good lubricant to the average buyer and be of considerable value as a talking point to the salesman, it is not proof as to what the oil will actually do in service. Incidentally, it might be mentioned that during the process of heating oil P, long before the flash point was reached, the oil turned black and considerable precipitate was obtained.

There are many points regarding the superiority of one oil over another which are demonstrated every day, and which do not require a delicate apparatus like the one described. For example, it is well known that of two oils known to be of standard qualities, one may be totally unfited for the service for which the other is used with great success. An engine fitted with tight pistons may run well on a thin oil, whereas the other oil, having more body, at the same temperature will cause hard running and ultimately scoring. It is also known that if a change is made from even a poor oil to a better oftentimes trouble will arise due to some peculiarities not fully understood.

To state definitely what each buyer should do in his particular engine is impossible for obvious reasons. However, to those who do not care to make, or have made, any special investigation as to the qualities of various oils, the following may be of value:

Study the lubrication in your particular car; use enough oil, but not too much. If the engine heats, don't conclude without investigating that it is from lack of oil. Too much oil will result in the formation of vapor, and this has the same effect as a slow burning mixture, i. e., it causes heating. The burning of this vapor will deposit carbon in most engines. Deposition of carbon in an engine, on the other hand, is not always traceable to the kind of lubricant, as it may be due to the peculiar shape of the combustion chamber, scavenging, quality of mixture,

Obtain a good oil and give it a fair show, and don't change every time an agent shows up with a less costly oil, "ever so much more effective than the one you are using." The higher the temperature at which an engine works the better the oil demanded. High temperatures mean efficiency, and a slight increase in the cost of the oil will never amount to as much as the saving in gasoline

#### CONCLUSIONS.

- 1. Don't tolerate cheap oils nor oils not specially adapted to automobile engines. An oil at 75 cents may cost less in a year than one at 40 cents, due to saving in wear on the engine and also because ordinarily less oil may be used with better success.
- 2. Don't value an oil by its color to the exclusion of all else. While light color usually denotes the results of filtering to rid the oil of impurities, some have resorted to acids to obtain the same effect in color, and this process is, of course. detrimental to the oil as a lubricant. There are, however, oils of good reputation which are quite dark. As a general thing, though, most dark oils are more or less viscous, and this property, while of considerable value with loose fitting pistons (as pointed out above) and bearings, is of no value in the average automobile engine of today, which is very nicely fitted, especially the pistons and bearings. For this reason such oils are not as satisfactory as the lighter oils. The all important feature is to preserve the film between the surfaces.
- 3. Don't accept high flash and fire tests as conclusive evidence of superiority. Most all good oils have high flash and fire points, but oils having high flash and fire tests are not all good.
- 4. Don't necessarily accept the agent's advice as to the oil to be used. This does not refer to dealers or manufacturers of high grade automobiles, all of whom have the long life of the engine in mind when recommending a lubricant. There are, as is well known, a number of dealers and manufacturers who are tied up in some way with the oil industry, and have an axe to grind in advising a certain oil.
- 5. All of the above may be condensed for many in the simple statement: "Buy the best oil and of a concern of good reputation."

# Penetration of Air and Carbonic Acid Through Tire Walls.

The Diamond Rubber Company, of Akron, Ohio, are reported to have made comparative tests to show the rate of escape of air and carbonic acid gas, respectively, from pneumatic tires. On October 14 at 1:30 p. m. three tires were pumped up with air to 100 pounds pressure, and three similar tires were inflated with carbonic acid gas to the same pressure. On October 21 at 1:30 p. m. the air filled tires are said to have registered 92 pounds each, and the three gas filled tires, 41, 50 and 51 pounds, respectively.

#### New Italian Automobile Regulations.

A new automobile law, signed at Rome on July 29 last, has recently gone into effect in Italy. It is very comprehensive, comprising no less than sixty-nine sections. The Minister of Public Works (Special Railway Bureau) will have charge of the enforcement of the law. The latter covers motorcycles (described as vehicles with two or three wheels), automobiles (vehicles with four wheels), propelled by any form of motive power, and trackless trolley cars. Local authorities may adopt special regulations for their territory, which must, however, not conflict with the general law and be approved by the Minister of Public Works.

Section 4 of the law relates to permissible speeds. It provides that mechanically propelled vehicles must always be so driven as not to obstruct free circulation, and not to constitute a danger to other persons or objects on the road; but in no case must the speed be greater than 15 km. (9.4 miles) per hour in the city, 40 km. (25 miles) per hour in the country during the day, and 20 km. (121/2 miles) per hour at night. Besides, the speed must be moderated at the approach to hidden turns, road intersections, railway grade crossings and points of congested traffic. The speed must also be reduced in accordance with municipal regulations, as indicated by signs along the roads passing through these municipalities, and at crosswalks where people are crossing the roads.

Every vehicle must carry two lights in front, throwing a beam of white light ahead which illuminates the road for a distance of 100 yards; and in the rear a lamp throwing a white light sideways, and a red light to the rear. Lamps must be lighted from dusk to dawn, and also during the day in case of fog. The use of glaring headlights in the city is forbidden.

All mechanically propelled vehicles must constantly keep to the right side of the road and pass to the left side only on overtaking other vehicles. However, municipal councils of cities with over 25,000 inhabitants may decree that within these cities all vehicles shall keep to the left, in which case this must be properly announced by signs at the entrances to the city.

All motor vehicles must be equipped with a one tone horn. The tone must be of low note for automobiles, and of high note for motorcycles. All other signalling devices are forbidden, except that within the open country sirens may be used in a "subsidiary" way.

All vehicles must carry metallic registration number tags both in front and rear. For privately owned cars the tags must be of rectangular form, with a white background, with the number corresponding to the province in which the car is registered thereon in red, and the registration number in black. Each numeral must occupy a space 4 inches high by 2.4 inches wide, and have a thickness of stroke of three-eighths of an inch. The figures must be in relief.

In case the front number plate should interfere with the normal functions of the radiator the number may be painted on the front of the vehicle with enamel paint. The number tags must be kept clean, so that the numbers can always be easily read.

Muffler cut-outs can be used only in the open country. Each car must have two independent brakes. If other than rubber tires are used they must not be less than 4 inches wide. The total weight per axle must not exceed 25 quintals (of 110 pounds) unless special permission is obtained from the Minister of Public Works. For the operation of road trains a special permit must be obtained from the Minister of Public Works.

Every vehicle for private use must be registered with the authorities of the province in which the owner resides. Applicant must present a copy of the official acceptance of the type of vehicle and a statement of the manufacturer that this vehicle corresponds with the type accepted. This part of the regulations is similar to the corresponding part of the French law. Manufacturers wishing to have a type of car "accepted" must apply to the Minister of Public Works, inclosing a fee of \$20. The chassis is submitted to a test by officials of the Railway Bureau, for which a fee of \$4 must be paid.

Motor vehicles can be driven only by persons who perfectly understand the construction and operation of the machine. To that end every driver must provide himself with a certificate of capacity which is issued by the prefect of the province in which he resides. When applying for this certificate he must submit to the prefect a certificate of birth, showing that he has completed his twenty-first year. If he is not yet twenty-one years of age, but has passed his eighteenth year, he must obtain the consent of the legal representative; also a penal certificate of recent date, a medical certificate of recent date, with special reference to his faculties of sight and hearing, and a certificate of graduation from a driver's school recognized by the Minister of Public Works and the Minister of Agriculture. Industry and Commerce. In case the latter certificate cannot be furnished applicant must pass an examination before an official of the Railway Inspection Bureau, for which a fee of \$2 is charged.

When a driver is convicted of an infraction of the law his certificate of proficiency is returned to the prefect who issued it, and the conviction is entered upon it. In case of an accident in which persons are injured the police officers charged with investigating the case will immediately obtain the certificate of the driver and send it on to the Minister of Public Works, who will decide whether is shall be revoked.

The Automobile Dealers' Association of the Netherlands has decided not to hold an automobile show during the coming year.

### The Purchase of Second Hand Cars.

By Albert L. Clough.

Almost everyone connected with the industry who is supposed to possess special technical knowledge of the same is occasionally approached by prospective purchasers for advice as to the wisest course to pursue. One of the questions most commonly asked is whether it is better to buy a new or a second hand car. The class of people asking this question most frequently are those who have a certain sum of money to expend which may not be exceeded, and who are deeply concerned that their money shall be invested to the best advantage. The pros and cons are so numerous that it is difficult to give an answer with assurance.

The argument in favor of buying a second hand car is based upon the assumption that the discount in the price of such a car, on account of its being second hand, is greater than its actual decrease in service value occasioned by the use it has been put to. This view implies that cars are frequently sacrificed by their owners; that a certain car may have proved unfitted to the purposes or unsatisfactory to the special taste of its original owner, though it may be a good car and perfectly adapted to some other person's requirements; that cars are sometimes sold at sacrifice prices to meet their owners' financial emergencies and under similar circumstances.

It is a common belief that when purchasing a car in an unused condition one is paying the agent's commission, and a large sum to cover advertising and other vending charges; but that in buying a car second hand these charges are not present in the same degree and that one is paving for what the consensus of the market regards as the prospective service value of the vehicle, In short, that when he sells the first owner "drops" the portion of the first cost which represented the more intangible part of the car's price, and something, perhaps, for the use he has had of it, and obtains a sum which is approximately a measure of the car's expected actual value in service.

There is considerable justification for this view. Not so very much expense is usually put into the selling of second hand cars. The ordinary dealer's business is to sell new cars, and the disposal of second hand cars is a side line with most such, He has made a profit on the first sale of each car, and he may be contented with a smaller margin of profit on the second sale or may even be satisfied to "break even,"

DEALER'S ALLOWANCES.

Second hand prices are curiously inconsistent, and, to all appearances, the same thing is offered at widely varying figures. As a rule the owner who trades in his car to a dealer for a new car of a competing line makes a much larger sacrifice than the owner who exchanges his old car for a new one of the same make. Dealers are anxious to keep the customers whom they have once secured, and to prevent users of the car they represent from adopting another make. They thus often make very flattering allowances for old cars of the make which they represent, and call attention to the fact that cars of this make command good prices second hand. When an owner turns in his car to the agent of a competing manufacturer the latter is anxious to make an attractive allowance, in order that he may secure a new customer; but, on the other hand, he dislikes to accord too high a second hand price to the car of competing make. On the average, it seems to be the fact that the allowance made for a used car by the agent of that make is larger than that made by the dealer in another make, and this leads to higher cash prices being charged for second hand cars of their own make than for those of other makes of similar grade. The second hand car purchased from the representative of that particular make may, however, be purchased with the expectation that it is considerably more nearly as represented and has been better overhauled than the car which is bought from the dealer in a competing line of cars. In the former case the dealer is endeavoring to enhance the reputation of his make by doing everything in his power to insure that the second hand car gives good satisfaction; while of the latter case it may at least be said that he has much less at stake, and naturally no special interest in the future of his competitor's product.

LAW OF SUPPLY AND DEMAND.

The price of second hand cars might naturally be expected to be determined very largely by the law of supply and demand, but the workings of this law in this particular sphere are rather obscure. In fact, second hand prices seem to be little standardized, and one purchasing a car has little definite guidance as to the price he ought

It is natural to assume that so long as progress in automobile technique is rapid and changes and improvements are at all marked, the prices of earlier models in the second hand market will be less than during periods when the art is more nearly at a standstill. It is certain that so long as improvements are being frequently and numerously adopted the value of cars of earlier model is decidedly less than under conditions of stable practice in the industry. Were the automobile art in a fully formed condition and practice substantially standardized, the price of a second hand car should be very closely related to its actual future service value. Under the contrary conditions which exist today second hand prices ought to be lower than they would be under the circumstances just assumed, because of the somewhat rapid obsolescence of cars as now produced.

EFFECT OF PRICE FLUCTUATIONS.

Whenever a decided reduction in the prices of new cars takes place, such as has recently been witnessed, one should expect an at least corresponding reduction in all second hand prices, unless some other factor, such as an increased general demand for cars which the industry cannot fully meet, acts to neutralize this tendency. It is quite possible that second hand prices, at the present time, may not have dropped far enough to represent the actual decrease of values that has been occasioned by the recent reduction in factory prices, especially as the demand for cars of all classes is so brisk just now.

The writer believes that so long as improved methods of construction and of production are being adopted, and so long as factory prices are on the down grade (despite exceptions), the conditions are not especially favorable for buying second hand cars, for it is so very questionable whether second hand prices represent quite enough discount from the original prices to equal the reduction in actual values.

EARLIER MODELS.

In buying a second hand car of earlier model the main questions that arise are as to what extent its serviceability has been reduced by the work which it has performed, and the degree in which it is obsolete in essential respects.

It is by no means always that the mileage which such a car has covered can be determined with any degree of accuracy, although this is a most vital piece of information. The current belief is that the important working parts are capable only of a certain, though indeterminate, number of repetitions of their functions, and that every mile run thus reduces their future expectancy of service.

Examination of a second hand car by an expert is worth something as to determining condition, but it is mainly useful in ascertaining the adjustment of moving parts and the security of holding devices. It gives little information as to how near to failure certain important working and structural parts may be. A car which has been recently overhauled and adjusted may pass this kind of an inspection, but, nevertheless, the crank shaft may be within a few hundred thousand revolutions of failure.

"MORAL" HAZARDS.

It is sufficiently difficult to estimate the loss in value due to use, but it is much harder to determine the depreciative effects of abuse. The best indication as to how a car has been handled may be obtained froma knowledge of the skill and character of its former owner or owners. The "moral hazard" involved in buying a second hand

car, used by persons unknown to the purchaser, is considerable. For instance, one cannot know whether the car has been run into a ditch, and the frame strained, and perhaps crudely straightened, so that it is merely "hanging by the gills," ready to fail completely when subjected to another severe stress. The reverse gears may have been accidentally thrown in while the car was moving forward, and the gear box so racked that it will part a little later under some severe though legitimate service condition. Parts which have been strained nearly to the limit, and thousands of miles of legitimate service "taken out of them," generally cannot be detected by a machinist's examination unless such parts are actually bent or cracked, and even such visible defects are readily overlooked. In this connection it should be remembered that repair parts for other than current models are not readily obtainable from all automobile manufacturers, and are likely to require some fitting, for it is only lately that cars have been built in numbers permitting the adoption of anything approaching interchangeability.

#### FOR A NEW DRIVER.

It is often contended that a second hand car is more economical for a new driver to commence his driving career upon than a new one, as damage due to unintelligent handling is likely to be less costly. This may be true if the car in question is "picked up" at a very low figure, but it is a fact that older models are more unhandy to lubricate and to keep in adjustment, the controlling devices are at least no more simple and convenient, and that usually no instruction book and little personal instruction accompany the purchase of a second hand vehicle.

While the manufacturer's warranty which accompanies a new car is of limited value as a binding legal obligation for the benefit of the purchaser, it is a fact, very much to the credit of the industry, that most manufacturers are rather liberal to the purchasers of their cars in the matter of replacements. It can hardly be expected that, after a car changes hands and a long time has elapsed since purchase, the manufacturer will maintain the liberal policy extended to his original customer for a reasonable but restricted period.

It is only within the last two years, and mainly within the last year, that the practice of producing cars upon an exceedingly large scale has become an important factor in the industry. Enormous savings per car produced in labor cost and overhead charges have been effected which enable good cars to be sold at very much reduced prices. At the same time it has become possible to employ in the manufacture of low priced cars, through the extension of late metallurgical knowledge, materials which closely approach in fitness those used only upon high priced cars a few years ago. The large concerns producing moderate priced cars can afford to maintain metallurgical testing departments, and to employ methods of

heat treatment which were until recently made use of only by certain advanced manufacturers

The result has been to bring the quality of the low priced car of the present day closer to that of the high priced cars of a few years ago, and to reduce the advantage to be gained by purchasing a second hand high priced car.

#### COMPARISON ADVISABLE.

If one is thinking of spending a certain sum of money for a car, it will be well to make a thorough investigation as to what can be bought new for that sum, to gather as much information as possible as to the design, material and workmanship of these cars, and as to the improvements and retinements which they offer that are not found in the cars of a year or two previous. If then, the purchase of a second hand car still seems the wisest course, the following suggestions may be worthy of consideration: Before deciding to pay a certain sum for a second hand car find out what cars of the same model and similar condition can be bought for elsewhere, especially in the large automobile centres. Ascertain, if possible, who were the former owners of the car in question, what sort of people they are and how much service the car has seen. Arrange for a good, practical demonstration and for a thorough examination of the car by a good automobile mechanic. Observe to what extent the particular car in question can be changed so as to bring it more nearly up to date, and what the cost will be to do this and to add the equipment which it lacks. Buy only from a reputable party or concern, securing a guarantee, if possible, from the seller, if he is responsible, and consider the advisability of buying a "factory overhauled" car, for sometimes better second hand vehicles may be obtained from the manufacturers than elsewhere.

#### A Pneumatic Jack.

The equipment of the Delaunay-Belleville car delivered to the Czar of Russia includes a pneumatic jack which is operated with air from a storage tank carried on the car. The jack consists of a vertical cylinder with a leather washer piston connected to a tubular piston rod which forms the ram of the jack, and carries a ball and socket jointed pad at its upper end. Air is admitted to the lower end of the cylinder by opening a needle valve, after the hose from the air tank has first been secured to the hose coupling. The ram of the jack then rises, and when it has attained the desired position the air valve is closed and a pin is inserted through holes in the tubular ram where the latter emerges from the head of the cylinder. When it is desired to lower the ram again, the pin is first withdrawn and an escape valve is opened. The pneumatic jack would appear to possess advantages in the way of saving muscular effort, but it is doubtful whether it is quicker and more compact than the best forms of mechanical jacks now on the market.

Hydrogen for Tire Inflation.

We read in the Allgemeine Automobil-Zeitung that M. Drouilly, a French mventor, has invented a process for inflating automobile tires with hydrogen generated by the decomposition of water under the influence of specially prepared aluminum. It is known that aluminum will decompose water in the presence of alkalies, producing clayey earths and hydrogen. Hydrogen thus produced has already been used by Drouilly, at the moment of its generation, while in the nascent state, for decoloring the saccharine juice of sugar beets, and it has also been used for the inflation of balloons, notably by the Russian army during the Russo-Japanese War.

For the inflation of tires aluminum m granular form is used, which, while giving rise to a less energetic reaction than aluminum powder, is nevertheless sufficiently active, and it keeps down the temperature increase and makes the manipulation easier.

Drouilly makes use of the well known air bottles commonly used for the inflation of pneumatic tires. After unscrewing the bronze cap he introduces into such a bottle of 3 litres capacity 300 grams of gramlated aluminum and 300 grams of water. Upon replacing the cap 375 litres of hydrogen are generated, which are compressed to a pressure of 150 atmospheres (2,500 pounds per square inch) in the remaining space of 21/2 litres. The precipitate, consisting of alkaline earths, may be easily washed out. In order to do away with the addition of potassium hydrate, or a similar alkaline compound, Drouilly adds a few grams of pulverized bichloride of mercury to the aluminum, which is sufficient to start the reac-

The pressure within the air bottle may rise as high at 1,000 atmospheres, depending upon the amount of the reacting substances used, so that great care is necessary in handling the apparatus. In a recent experiment, in which the necessary safety measures were taken, a tube which had been tested to 600 atmospheres was exploded by this process, and some of the splinters of the bottle were found at 50 yards from the point of explosion. M. Drouilly is now occupied with the construction of a safety valve which shall prevent such mishaps. It is most important to add a sufficient amount of water, in order that the resulting rise in temperature does not vaporize the water. as in that case the steam pressure would be added to the gas pressure and an explosion would result.

This novel process permits of utilizing the empty steel air bottles which otherwise would represent only dead weight. It is also claimed that inflation with hydrogen perature of liquefaction, and diffuses, therethat hydrogen will not pass through the walls of the tire as readily as air. It is claimed that the diffusion of a gas through rubber walls depends upon the point of liquefaction. Hydrogen has a very low temperature of liquefaction, and diffuses, therefore, very slowly through a rubber wall.

SUBSCRIPTIONS (payable in advance), Domestic, \$2.00 a year; CANADA, \$3.00. All other foreign countries included in the Postal Union, \$4.00. Single copies, 10 cents.

Brentano's, 37 Avenue de l'Opéra, Paris.

COMMUNICATIONS .- The Editor will be pleased to receive communications on trade topics from any authentic source. The correspondent's name shuold in all cases be given as an evidence of good but will not be published if specially requested.

Address all communications and make all checks, drafts and money orders payable to The Horse-LESS AGE, 9-15 Murray street, New York.

Entered at the New York post office as secondclass matter.

One week's notice is required for change of advertisements.

Telephone: 7195 Barclay. Cable: "Horseless." New York and London. Western Union Code.

#### Mathematics Rehabilitated.

We publish in this issue two pages of letters from readers in response to our recent editorial on mathematical articles. These are by no means all of the letters received in reply to our appeal, but we considered that these would be sufficient to show that mathematical articles do serve a useful purpose and are of interest to a considerable section of our readers. Needless to say, we will not discontinue the publication of these articles.

It will be observed on reading the letters that many of the writers use the terms mathematical and technical articles interchangeably, being evidently of the opinion that there can be no real technical article on automobile subjects without the use of mathematics. The fact of the matter is that the use of mathematics is necessary in the design of automobiles, and the man who attempts to enter this field without mathematical education will soon find that he is laboring under a very great handicap. The

number of men with mathematical training in the automobile business is by no means small, and their intercommunication through the medium of a technical paper conduces to more rapid progress in automobile construction. The owner, of course, does not care to go into automobile matters to the extent of calculating the stresses in various parts, nevertheless this technical discussion is also of advantage to him, for, as one of the writers aptly remarks, "he receives the benefits with his car." We do not want it inferred, however, that we will confine ourselves entirely to this class of matter. The user, the dealer and the repair man will be equally taken care of.

#### Winter Contest Fiascos.

The annual Quaker City midwinter endurance contest, which had almost attained to the standing of a classic event, has been called off, and now comes the announcement that the Worcester A. C,'s winter endurance run, which had been set for December 17 and 18, had also to be abandoned on account of lack of entries. The cancellation of both of these winter competitionsthe only events of the kind scheduled for this season-calls for an inquiry into the apparent lack of interest in such trials.

In the case of the Quaker City run it is probable that the very inclement weather encountered on last year's run had a deterring effect on possible entrants. The organizing club is a dealers' organization, and the local dealers and nearby manufacturers have always been depended upon for entries. It seems that these became somewhat discouraged by last year's weather conditions, many of the participants having become ill after the run. In such contests it is often necessary for men to take part as observers, reporters, etc., who are not accustomed to outdoor life in winter time, and whose constitution is not equal to the strain imposed by the cold. Besides, the drivers in such a contest, in their eagerness to make a good showing, often forget about their own safety. In case of a breakdown, for instance, they will work themselves into a sweat, and then drive off in the face of a strong wind. In this respect the conditions are entirely different from ordinary winter

While the above consideration may also have been a factor in the failure of the Worcester contest, it is thought, however, that the novel brake test proposed was not looked upon with favor by dealers and private owners. The tests were to be made at

the Worcester Polytechnic Institute in the mechanical laboratory, in which an automobile dynamometer is installed which has been described in these columns. The impression seems to have gained ground that the object was to give the students at the institute opportunity for the experimental study of various cars, and most owners did not feel inclined to lend their cars for this Durpose.

Another reason for the failure of these two proposed contests may have been the superabundance of competitions the past seasons. Manufacturers and others naturally grow tired of competitive events at last. Besides, it is doubtful whether the public can be brought to a full realization of the relative difficulties of a winter tour in stress of weather for the reason that in the accounts of private test runs, even during the best part of the year, the roads are almost invariably described as abominable and beyond description, and they have therefore become more or less hardened to such descriptions, and inclined to make allowances.

#### Lubrication in Cold Weather.

On account of the satisfactory cold tests possessed by the better grades of cylinder oil now in use, no change is usually necessary in the engine lubricant upon the advent of cold weather. With the lubricant employed in the gear box and the driving gear housing the situation is somewhat different. In these two casings a lubricant is usually employed which even under summer temperatures is decidedly viscous, with a sufficient degree of solidity, indeed, so that it acts to quiet the noise of the gears. Such lubricants as a rule thicken rapidly with a reduction in temperature, and in sufficiently cold weather assume a non-fluid or buttery consistency. Their distribution over the gear faces and bearings is then likely to fail, as the moving gears cut out grooves for themselves in the semi-solid mass, and soon operate out of contact with the lubricant, becoming very noisy. Unless the gear shaft bearings are provided with separate oil leads from a mechanical lubricator they may suffer seriously from lack of lubricant, which is normally carried to them by the gear faces. This lack of effective gear box lubrication is especially noticeable in the case of cars which are housed in unheated garages or are left standing for long periods in the open. For a time after starting from a cold condition lubrication is very imperfectly performed, but after having been run for some time the heat carried rearwardly from the engine warms the gear box and thaws the grease, when splash distribution again becomes effective. The driving gear casing shares but little in the effect of the warm air from the engine, and its lubricant is likely to remain in rather a stiff condition, hardly adapted to the effective lubrication of the ball bearings of the differential gear and pinion shaft.

With these facts in view, a recommendation to motorists just now becomes timely as to using a quality of gear case lubricant which is adapted to winter temperatures. By using a grade which possesses a cold test sufficiently high to insure its exhibiting the proper degree of fluidity at all temperatures met with in service, or still better, perhaps, by adding to a rather stiff lubricant a sufficient quantity of rather thin oil, so that at all times there may be lubrication available for the bearings, the difficulty may be successfully met.

### Pneumatic Tires on Commercial Vehicles.

Until very recently it has been a generally accepted belief that the use of pneumatic tires upon commercial vehicles was out of the question from an economic standpoint, and also impracticable on account of their lack of reliability.

However, the equipment with pneumatic tires of a number of European commercial cars and their adoption by certain American manufacturers for trucks of a carrying capacity of about 1½ tons have thrown doubt upon the correctness of the above mentioned view.

There are several causes which have led to this entry of the pneumatic tire into the commercial vehicle field. Pneumatic tires are now capable of decidedly greater service, under given conditions, than they were a few years ago, and they are also more uniform in quality. Great advances have also been made in respect to means for quick tire replacement in event of failure.

Furthermore, it has only recently become recognized that by using pneumatics of very liberal carrying capacity for the load handled not only may a degree of reliability in service much in excess of that ordinarily obtained be secured, but the tire cost per mile may be reduced even when the extra cost of the larger tires is considered. The speed, and consequently the earning capacity, of commercial vehicles has hitherto been strictly limited by the vibration

and noise consequent upon the employment of solid rubber tires. When operated at more than a certain speed a solid tired vehicle is found to depreciate in its general condition at a rapidly increasing rate, and repairs and replacements also become excessive. On the other hand, if a commercial car cannot be successfully operated at a speed somewhat in excess of that of similar horse drawn trucks, the heavy fixed charge, including interest upon the investment, operator's hire, and so forth, seriously reduces its advantage over an animal drawn truck. The belief is growing ground that the use of pneumatic tires will successfully make permissible a higher, and therefore more profitable, rate of speed, and at the same time reduce depreciation and repair expense by softening the shocks to which the mechanism is subjected. With an equipment of dual tires of excess carrying capacity it is contended that the liability of blow-outs can be practically avoided, and that the delays due to punctures will bear but a small ratio to the time saved by the higher allowable speed.

Competition between the solid and the pneumatic tire upon commercial vehicles of moderate capacity, which thus appears to be commencing, may well be closely watched. In this sphere of motor propulsion the decision between the two will rest entirely upon economic grounds.

# Winter Use and Its Importance to the Trade.

It is a common subject of remark that motor cars are recently being more generally kept in service during the winter season in the smaller cities and towns. The custom of jacking up cars, taking off the tires and putting them up for the inclement season appears to be much less popular than formerly in these communities. In the large cities, of course, all the year round service has for some time been the rule rather than the exception.

The widespread realization that the automobile is suitable for winter service under ordinary urban and even village conditions means considerable direct increase of business for the garage proprietor and the supply dealer, and indirectly increased sales for the manufacturer.

The general appreciation of the protective capabilities and the innocuous nature of improved anti-freeze solutions, the adoption of oils of higher cold test, the more general fitting of cars with tops, wind shields and storm curtains; the realization of the meris of traction increasing tire attachments and the placing upon the market of cars with closed bodies at greatly reduced prices have all contributed to the extension of motor car use during cold and inclement weather.

An important influence which has tended to stimulate winter running in the smaller places is the example of the doctors, who were the first class of users to appreciate the utility of the automobile for town service under all weather conditions. The commercial car, the economical employment of which calls for its operation with as few idle days as possible, by being kept in service during the winter, has proved a useful object lesson.

Gradually the taxicab and other public passenger vehicles have made their appearance in the smaller communities, and its regular appearance upon the streets during the winter has exerted a strong exemplary effect.

Then, too, commodious, well heated garages, open at all hours, have been built in nearly all the smaller cities and towns and have encouraged their customers in the winter use of their cars by a system of "in and out" storage furnished at reasonable rates.

In this connection it may be remarked that there are possibilities of further stimulating the winter use of motor cars by an energetic development of means for vehicle heating upon the part of automobile and accessory manufacturers. A large amount of heat is constantly being rejected from automobile motors, which, if only partly utilized, would suffice to warm the cars which they propel and make them exceedingly comfortable in cold weather. Warming by means of heat rejected by the motor is applicable not only to cars with closed bodies, but to ordinary touring cars when equipped with top, side curtains and front protection.

Thus far engine heat has been applied only to the warming of a small number of expensive town cars, but there is no obvious reason why its advantages should not be enjoyed by all who drive cars that are or can be reasonably well closed in. Exhaust heaters adapted for attachment to any make of car can now be purchased, and it is hoped that the practicability of vehicle heating may be more energetically urged upon the public in the future.

The committee of the Chicago A. C. is reported to favor holding the Cobe Race on a track next year.

### Pointers on Front Wheel Brakes.

By Chester S. Ricker and Earle A. Ryder.

It would be well worth the while of some of our American designers to consider the matter of applying front wheel brakes to their product. These brakes have been well received in Europe, and especially in England, and certainly deserve attention.

With the widespread introduction of cars capable of attaining high speeds it becomes necessary, in order to insure the safety of the road using public, to cast

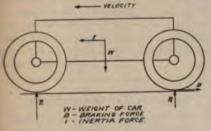

Fig. 1.

about for some means of increasing the braking power of our cars. The higher the speed we reach the greater the importance of any device that makes for greater safety. Many cars now on the market have brakes sufficiently powerful to slide the rear wheels without undue exertion on the part of the driver, so it is obvious that the limit in this direction has been reached. It will be seen, however, that by applying brakes to the front wheels also the braking power of the car will be increased by more than 100 per cent. Many people look at this matter in the same light as the front wheel drive and some other features that have been proposed but not yet perfected.

FEATURE OF THE OLYMPIA SHOW.

The number of exponents of this construction at the Olympia Show indicates how much attention has already been given to the subject. Indeed, the reception tendered this feature by both the public and the trade points to a more extensive use in the future. The sooner we get busy the sooner we shall overtake and pass our foreign rivals, who are still, we must admit, our teachers in many things. (A notable example is the sudden adoption of the flush sided body in this country after at least two years' extensive use in England.)

The same people who look askance at front wheel brakes for automobiles would ridicule a proposition to put out railway cars with brakes on only half the wheels. There is not so much difference between the two cases; in fact, it would seem that the automobile is in greater need of the best possible braking facilities than is the railway car, traveling as it does on a highway which has no block signals, and often at great speed.

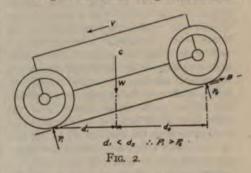

It is to be noted that the usefulness of the front wheels for braking is greater than that of the rear ones, in proportion to the weight on each. When the machine is moving forward, a backwardly acting force applied below the centre of gravity produces a moment tending to tip the car forward, thus bringing more weight, or rather pressure, on the front wheels than they normally bear. This is shown graphically in Fig. 1. The maximum attainable braking force is directly dependent upon the pressure between the wheels and the ground, and this maximum occurs at the point of incipient slippage.

SUPERIORITY ON HILLS.

Every observing driver must have noticed that the brakes on a car seem to lose some of their ability when descending a steep hill; that is, it requires less pressure on the pedal to cause sliding of the wheels than when running on the level. This fact is explained in Fig. 2; a vertical line through the centre of gravity passes nearer the front wheels than the rear ones, so that a greater part of the weight of the car is supported by the former than by the latter. When slowing up while progressing down a hill the effect outlined in Fig.

I is added to this, giving the rear wheels a still greater handicap. Another very great advantage of having one set of brakes on the front wheels is that they may be used alternately with the rear brakes during a long descent, the use of each allowing the other set to cool. Where both brakes operate on the same or adjacent drums this cannot be done.

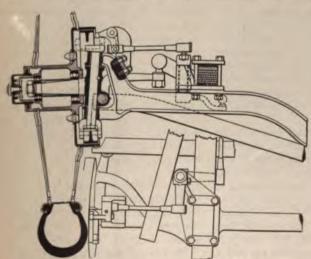

In regard to normal weight distribution

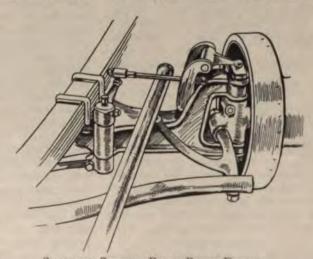

many of the present day runabouts, and practically all cars when stripped for racing, have an excess of weight over the front wheels. Cars with heavy closed bodies are heavy in the rear, but have a high centre of gravity, which intensifies the two actions referred to above.

#### NO EFFECT ON STEERING.

There are no great difficulties lying in the way of the successful application of brakes to the front wheels. However, there are a few precautions to be observed in this connection. Naturally, the first question that rises is whether the steering will be affected in any way. In order that no trouble shall be experienced from forces set up on account of inequality of braking due to difference in the condition of the braking surfaces of opposite sides of the car, a line through the axis of the steering knuckle should meet the plane of the wheel at the point of contact of the wheel with the ground. In the case of the Shef-

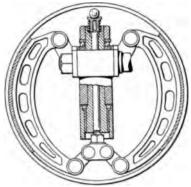

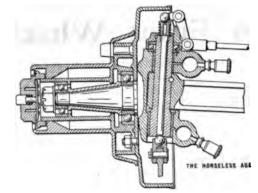

ASSEMBLY SHEFFIELD SIMPLEX FRONT BRAKE

SHEFFIELD SIMPLEX FRONT BRAKE DETAILS.

Note suspension of brake actuating rod from axle instead of from frame.

CROSSLEY FRONT WHEEL BRAKE ASSEMBLY.

field-Simplex this is very nicely accomplished by the use of wire wheels and the expedient of tipping the wheels out and the knuckles in. In case it is not found expedient to bring the axis of the knuckle and the plane of the wheel into the above mentioned relation, the wheel should be set in as close to the knuckle as is possible, for if one brake grips harder than the other the result will be an excess force. tending to steer the machine off to one side of the road. Of course, irreversible steering gears are so generally used that this action could produce no harmful results. except in case it were desired to steer toward the side opposite to the one the machine tended toward. It will be seen from this that an equalizing device will be indispensable. Care should be taken in the selection of the braking surfaces, so as to get those which are least affected by water. dirt, etc. It is possible, and very desirable, to enclose the brakes entirely, as is done in the case of the Arrol-Johnston.

Another point to be observed is that of applying the braking force in such a manner that the turning of the wheels incident to steering will cause no variations in the braking. The arrangement of the operating rods should also be carefully worked out in order that the action of the springs shall not produce variations of pressure on the brakes. In the Crossley car we note that the operating rods are short and are brought from the brakes to points on the side frame members. It looks as though variations in the spring opening would cause variations in the braking force. The logical way of disposing of this matter is to run the short rods from the brakes into points on the axle, and from these points run long rods back to the operating point.

#### ELIMINATION OF SKIDDING.

It has been found in actual use that it is practically impossible to make a car skid by the use of the front wheel brakes. If the car skids due to the action of the rear brakes the skidding may be stopped by releasing them and applying the front ones. It is interesting to note in this connection that most of the manufacturers using both front and rear brakes make the drums for both of the same size, the object apparently being to give equal power to them.

#### EXTRA STRESSES.

It should be remembered that extra stress will be caused in the tie rod unless

the conditions outlined for the knuckle axis and the plane of the wheel are realized, and this most important member must be designed accordingly. The front axle will be subject to bending stress in a fore and aft direction as well as in a vertical plane, and the distance between the spring seats or radius rods and the wheels should be diminished, if possible. The radius rods should be examined for strength, if they are used, and if the springs are called upon to take the stress their fastenings should be checked up.

#### Motor Omnibus Finance.

The London General Omnibus Company, Ltd., held its annual meeting on Wednesday, December 8, and the accounts presented to the shareholders showed a net profit for fifteen months of \$361,025, which is not much when it is known that the total paid up capital is \$12,890,000. For many years prior to the advent of motor omnibuses this company regularly paid dividends varying from 5 to 12 per cent. per annum, and owned about 2,000 horsed buses, together with some 20,000 horses to work them. When motor buses became a commercial proposition the L. G. O. C., Ltd., derided the innovation, and then, when competition set in from their more wideawake competitors who had purchased motor buses, the London General recklessly spent half a million dollars in Continental machines without first seeking the aid of competent technical advisers. Men who had been superintending horses all their lives were put in charge of a big fleet of mechanically propelled machines. A little over twelve months ago, when bankruptcy stared them all in the face, the three principal bus companies in London, viz., the London General, the Vanguard and the London Road Car Company, decided to amalgamate, and raised fresh capital by the issue of debenture stock.

The number of motor buses owned by the combine totals 1,100, all carrying thirty-six passengers and driven by 24 horse power, four cylinder engines, fitted with sliding gear transmission. The company claims to have made a net profit on these vehicles this past year of (in round figures) \$300,000, while they have simultaneously lost \$225,000 upon the working of 1.100 pair horsed vehicles. This shows that the motor buses have earned a fair profit.

The aggregate mileage of the horse and motor buses was 60,320,105, and they carried 408,491,283 passengers in the twelve months. But while 1,053 horsed buses were the average daily number in use out of the 1,100 that are owned, only 634 motor buses, on the average, have been working daily. Although the number of motor buses owned is suppressed in the report, the total is available to anybody caring to make inquiries of the registration authorities.

The most serious item in the report is that not a single cent is written off for depreciation of the rolling stock, and if the proper sum had been allocated in this direction the so called profit would be turned into a loss of \$10,000. The company further face a refusal of the police to renew the licenses of their present types of vehicles unless very costly alterations are undertaken.

#### Street Air Connections.

It has become quite a common thing for tire manufacturers' branches and agencies to have air "on tap," so that customers and in many cases the automobile public in general may reinflate their tires to the proper pressure or inflate a new tire after fitting it to the rim. Sometimes portable air tanks are provided for the purpose, but more often a flexible tubing is used which is connected to some fixture within the store. In many cases a locker is fitted at the side of the building, containing the tubing and universal connections, keys to the lockers being furnished to interested parties. The air is supplied from a tank the pressure in which is maintained by a motor driven pump. The disadvantage of this method is the fact that the tubing has to be unduly long, and passersby are quite likely to trip on it when it is in use.

A scheme which overcomes this difficulty is the use of what for a better name may be termed "a street air connection." An apparatus of this description is used at the Atlanta branch of the B. F. Goodrich Company. This device is of the simplest possible description. A post similar to a hitching post is planted at the edge of the sidewalk next to the curb. A quarter inch gas pipe is laid under the sidewalk and the end is brought up alongside of the post, this end terminating in a suitable valve. A simple stopcock is used which has a long lever which is so arranged that it may be locked in a closed position by means of a padlock. A union is, of course, provided by means of which a flexible hose is attached to the end of the pipe. It would seem that the idea might be further elaborated by using a box in place of the post which might contain the flexible tubing ready for use. By this course the tubing could be permanently attached to the pipe and would not be in danger of being lost or mislaid, as is the case when it is kept in the store or a separate locker.

The convenience of these free air posts is much appreciated by motorists.

### GREAT QUESTIONS OF AUTOMOBILE ENGINEERING.

#### Gear Box Position.

By Albert L. Clough.

In this article the writer will set forth the commonly accepted arguments relating to the advantages and disadvantages of the three principal methods of arranging the three elements of the transmission chain, namely: The unit power plant, consisting of engine and gear box rigidly related; the rear axle transmission unit, consisting of gear box and axle housing rigidly related, and the separate unit, or so called conventional arrangement, in which engine base, gear box and rear axle housing are all three independent structures.

Two varieties of the unit power plant exist. In the first the flywheel is mounted upon the front end of the crank shaft and the clutch and change speed gear is carried either in a rearward extension of the crank case itself or in a casing rigidly attached to the rear thereof. In the second. the flywheel is at the rear of the engine and it, the clutch and the change speed gear are contained either in an extension of the crank case having an enlarged portion of such diameter as to contain the flywheel, or the flywheel is supported but not necessarily enclosed in a yoke fastened to the rear of the crank case, to the rear of which the gear box is attached.

#### UNIT POWER PLANTS.

Among the arguments in favor of the unit power plant in general are the following: That its employment renders unnecessary any universal joint provisions between the engine and clutch and the gear box, and that the crank shaft and the gear shafts are held in constant relationship, if the casings are sufficiently rigid. This constancy of alignment secures efficiency in transmission and freedom from noise and wear. That the elimination of the universal joint, of one end wall of the gear box and one end wall of the crank case leads to greater lengthwise compactness. That some weight may be saved by these eliminations without sacrifice of strength. That the arrangement lends itself particularly well to the three point method of support, and that the adoption of this practice by freeing the supported structure from the liability of distortion may result in further weight reduction.

That there is less labor in assembling a unit power plant than in assembling a separate engine and gear box, that there is no risk of misalignment involved in the process, and that in case of damage to any part of the unit it is very readily detached from the frame and a new unit from the factory may be put in its place by ordinary mechanics while repairs are being made.

That pedals and control levers may be made a part of the unit power plant, which devices assemble with it and remove with it, if dismounting is required, separate mountinated, and exposed linkage being done away with. That the rear end of the unit is so far forward on the frame that a very long propeller shaft may be used and its angularity reduced to a very low value, re-

ings for these control members being elim-

angularity reduced to a very low value, resulting in very little work for the universal joint or joints thereof. That the portion of the unit enclosing the gears and clutch is far enough forward so as readily to be accessible by raising the floor boards and is not under the front seat and gasoline tank, as in some other designs.

Among the disadvantages cited are the following: That combining the engine base and gear box brings the centre of gravity of the car too far forward, so that, especially if only the front seat is occupied, the adhesion of the rear wheels to the road is seriously reduced and there may be an unusual tendency toward skidding. That, in order to render the combined crank and gear structure sufficiently rigid with the use of a reasonable amount of metal, its length is reduced to the limit, with the result that the contained parts are so crowded as to sacrifice accessibility and the possibility of the separate removal of the different elements.

As advantages of the first enumerated form of unit power plant, it is pointed out that the location of the flywheel in front increases the effective clearance of the car. That, as no enlargement of the housing has to be provided for the flywheel, and as its length does not include space for the wheel, it can be made much more rigid with the same weight than in the other construction. That if the extension for the clutch and gears is cast integral with the crank case there are no joints through which oil may leak or dust enter and the clutch is completely housed and may be effectively lubricated if desired.

The disadvantages cited against this construction are: That the front flywheel mounting brings the centre of gravity of the car toward the front more extremely than any other method of carrying the vehicle mechanism and detracts greatly from rear wheel adhesion, besides throwing excessive duty upon the front tires. That it is difficult to remove for repairs the clutch or parts of the gear set and that in event of the irreparable breakage of any part of the combined housing, the whole expensive and complicated structure has to be discarded. and further, that the subjection of the crank shaft to the heavy torque due to the energy stored in the flywheel is disadvantageous.

As points to the credit of the second form of the unit power plant it is asserted that the flywheel being to the rear of the engine the centre of gravity of the car is further to the rear than in the form just spoken of, and the rear wheel adhesion somewhat better. This is of special importance in the case of vehicles of long wheel base, in cars of which character the application of the unit power plant construction offers in general less advantage than in short cars. That all the advantages of oil tightness and perfect enclosure of parts attainable by the first method may be secured by this construction if it is integral in design.

To the discredit of this design it is urged that effective road clearance is less than in the first method. That the provision of the portion of the casing of large diameter required to house the flywheel is likely greatly to weaken the casting unless very liberal proportions are insisted upon, and the weight thereby prejudicially increased. That the heaviest element of the whole unit—the flywheel—comes nearly at the centre and weakest portion of the housing.

Regarding "bolted up" construction as applied to unit power plants, it is contended that this practice allows the separate elements to be readily removed as such, and that breakages of supporting members involve less expensive replacements; but in answer to these points it is claimed that it is difficult correctly to align the separate elements after removal, and that the machine work necessary to insure correct assembly involves expense which goes far toward neutralizing the advantages of the method.

Of the form of unit power plant in which the rear mounted flywheel is surrounded by a supporting yoke, but not completely housed, it is remarked that lubrication and dust exclusion are not so well provided for.

#### TRANSMISSION AXLES.

Leaving the unit power plant and considering the transmission axle or combination of the gear box and rear axle housing, one finds the following points of excellence brought forward in its favor: That it tends toward a very correct division of weight between front and rear wheels, and toward adequate driving wheel adhesion.

That it, in common with the unit power plant, eliminates one universally jointed connection required in the conventional arrangement, namely, that between the gear box and the axle.

That since the gear box is bolted rigidly to the axle housing there is always a correct relation between the through shaft of the gear set and the driven bevel of the axle. That the provision of adequate support for the pinion shaft is facilitated. That it shares with the unit power plant arrangement the advantage which accrues from the use of a long drive shaft, with slight angularity.

That by its use the torque transmitted through the universal joint arrangements of the drive shaft and the drive shaft itself never exceeds that due to the motor, even when the lowest gear is in use, for the reason that the multiplication of the torque is performed in the gear box at the axle to the rear of the drive shaft. That, consequently, a lighter drive shaft may be used and the universal joint or joints may be lighter for a given size of motor. That the consolidation of the gear set on the axle makes it possible to use gear combinations other than the conventional, and to drive the axle "direct" at more than one gear ratio.

That in common with the unit power plant the work of assembling the mechanism upon the frame is reduced on account of the fact that but two units are to be mounted, as against three in the conventional arrangement.

The corresponding disadvantages include the following points: That the attachment of the gear box to the rear axle housing increases the unsprung weight of the same and causes the tires to be subjected to heavier uncushioned shocks. That the weight added to the axle housing by the gear box is applied at its centre, its weakest point, and that more metal must be put into the housing to give it rigidity, and it must be trussed in a very substantial manner. The added weight of the axle housing further aggravates the uncushioned blows upon the tires. That the gear shifting linkages between the control levers and the gear box move when the rear axle moves, and that their correct design is more difficult on this account.

#### FRONT SWIVEL GEAR BOX HOUSING.

For the arrangement which is closely related to the above, and which combines the gear box with the rear axle, with the drive shaft housing between them-the whole forming a rigid unit—it is claimed that but one universal joint is required, or can be used, that being located at the front end of the gear box between the same and the clutch. It is further claimed that this arrangement possesses most of the advantages of the usual transmission axle arrangement, but adds but little to the unsprung weight appertaining to other systems. It is objected, however, that the use of the single universal is theoretically undesirable, but the answer to this is that the arrangement gives good results in extensive service.

#### THREE UNIT SYSTEM.

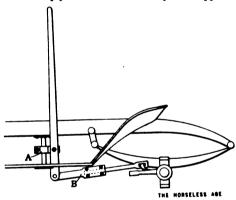

For the conventional three unit system it is claimed that the three units, being entirely separate, are readily removable singly, and that replacements are less expensive than the replacements of elements serving a double purpose. That each of the three elements being universally connected to its neighbors, no undue friction can occur between them, especially as they may be so arranged that the angularities of the power line are very small under all conditions of practical use. That there is no tendency toward crowding, as there is likely to be where a single housing is used for two purposes, and that the distribution of weight upon the chassis is more favorable to good

balance and rear wheel adhesion than with the unit power plant.

The objectors to the three unit system maintain that the cost of assembling the car is needlessly large under this plan of construction; that it is less compact and "clean" in aspect than it should be; that the gear box is likely to be placed inaccessibly under the front seat; that more stock, and hence more weight, is required for three complete housings than for two; that two or possibly three universal joints instead of one, or at most two, are required, with their attendant cost, inefficiency, necessity of lubrication and possible noise production; that the frame provisions for the mounting of two separate units are necessarily more expensive and heavy than those required for the mounting of a single unit, and that there are more places where oil may leak out or dust enter than in the combined systems.

#### Emergency Steering Gear.

One of the garages in New York city has its emergency wagon equipped with an emergency steering lever which can be quickly secured to the running board bracket, as shown in the accompanying cut. It consists simply of a lever with a pivot support

EMERGENCY STEERING LEVER.

adapted to be clamped to the bracket, and a short length of rod hinged to its shorter arm, which can be clamped to the fore and aft steering rod. By this means a man in the front seat or on the running board can steer a car whose steering gear has been disabled in any way.

#### The Studebaker-E-M-F Tangle.

The Studebaker Automobile Company last week, following the announcement of the E-M-F Company that the exclusive distributing agency agreement with the Studebaker Company had been annulled, ran an advertisement in several metropolitan papers to the effect that they were still selling and would continue to sell E-M-F 30s and Hudson 20s. From Detroit it was learned that the Studebaker holdings in the E-M-F Company amounted to a little more than 35 per cent., and that the rest of the stock in the company was owned by Chas. L. Palms, Dr. J. B. Book, J. B. Gunderson, William T. Barbour and Walter E. Flan-

ders, of Detroit, and A. D. Bennett, of Port Huron, Mich. It is stated that disagreements first arose toward the end of November, and while the trouble was at its height fancy prices were offered for E-M-F stock by brokers, but none was sold, except by some Port Huron holders. The contract with the Studebaker Company, it is stated, called for 15,200 E-M-F cars and 14,800 Flanders 20s. It is stated that the Studebakers never put ony money into the E-M-F Company directly, but bought out the holdings of William E. Metzger and B. F. Everitt in the company.

### Chalmers-Detroit and Hudson Companies to Separate.

An important change in the operating plans of the Chalmers-Detroit and the Hudson Motor Car companies is to be effected gradually during the next six months.

Beginning not later than July 1, 1910, these two companies will be owned and operated separately. Heretofore they have been largely owned and controlled by one group of men—the controlling group in both companies consisting of Hugh Chalmers, E. R. Thomas, R. D. Chapin, H. E. Coffin, F. O. Bezner, Jas. J. Brady, Lee Counselman, J. L. Hudson, R. B. Jackson and Geo. W. Dunham.

Next spring three of the present Chalmers-Detroit officers, namely, Messrs, Coffin, Bezner and Chapin, will assume control of the Hudson Motor Car Company, while Messrs. Chalmers, Counselman, Brady, Ford and Pfeffer will continue with the Chalmers-Detroit Motor Company, Mr. Chalmers as president and general manager, Mr. Counselman as vice president and assistant general manager, Mr. Brady as second vice president and factory manager, H. W. Ford as secretary, and C. A. Pfeffer as treasurer. Mr. Dunham, the chief engineer of the Hudson Motor Car Company, will assume a similar capacity in the Chalmers-Detroit Motor Company.

The new officers of the Hudson Motor Car Company will be: J. L. Hudson, chairman of the board; R. D. Chapin, president: H. E. Coffin, vice president; F. O. Bezner. secretary; R. B. Jackson, treasurer and general manager; E. C. Morse, sales manager. Mr. Jackson, who has been treasurer and general manager of the Hudson Motor Car Company since its inception, will remain with the Hudson Company.

This change in the officials of the two companies was made possible by the exchange by Messrs. Chapin, Coffin and Berner of their Chalmers-Detroit holdings for Mr. Chalmers' Hudson holdings and a cash bonus. Thus Mr. Chalmers acquires control of the Chalmers-Detroit Motor Company, and Messrs. Chapin, Coffin and Berner acquire control of the Hudson Motor Car Company.

R. I. Macklin, florist at Marshfield, Wis, has purchased a Maxwell runabout with special body for deliveries.

### DESCRIPTIONS OF NEW VEHICLES AND PARTS.

#### The Herreshoff Car for 1910.

The Herreshoff Motor Company, of Detroit, Mich., have just made announcement of their second year's product, a car, they say, intended as a smaller edition of a high priced machine. The unit type of construction is followed. The motor, clutch and transmission constitute one unit, and the driving shaft, bevel gears, differential and rear axles a second unit. This arrangement minimizes the chance of misalignment of parts and conserves the power developed, delivering a very high percentage of the motor output to the rear wheels. The power plant is hung low in the subframe, which gives practically a straight line drive, reducing wear and preventing loss of power.

#### THE MOTOR.

The motor is of a four cycle, four cylinder, water cooled type, with cylinders cast in pairs, with integral water jackets. The cylinder bore is 33% inches and the stroke 3¾ inches. The inlet and exhaust valves are of large diameter, interchangeable and are located on one side. This construction operates to reduce the loss of heat in the water jackets and to conserve the power, since the incoming gas helps to cool the exhaust chamber. The valves are operated by very hard steel cams, on one cam shaft, which is mounted on imported ball bearings. The inlet and exhaust manifolds are large and have no elbows or corners for the collection of gas.

The crank shaft runs on three imported ball bearings; it is a drop forging, ground to size, and balanced as a unit and with the flywheel assembled. The connecting rods are of drop forge steel of I section. The caps are doweled and held in place with chrome nickel steel bolts. The crank

pin bearings are of die cast babbitt. The upper ends of the connecting rods are securely clamped to hollow wrist pins which have their bearings in the pistons.

The carburetor is of the float feed automatic type, the gasoline feed being regulated by a graduated needle valve. The gas is controlled by a hand lever on the steering wheel and by a foot accelerator. The gasoline tank is placed under the driver's seat, the gasoline being fed by gravity to the car-

vided, viz., a high tension Bosch magneto, operated with a fixed spark, and a storage battery and four unit coil and timer. These two systems are controlled by a switch in easy reach on the coil box, located on the dash.

The magneto is located in the left hand side of the crank case and is held in position by a clamped band. It is driven from the crank shaft gear through an idler gear. A flexible coupling is provided in its driv-

1910 Touring Car.

buretor. On the runabout and tourabout types an air pump is provided for pressure feed for use on hills.

The vertical type radiator is of large capacity. Drawn brass pipes carry the water to and from the cylinders, and their large size facilitates the thermo circulation. The fan behind the radiator is mounted on ball bearings, and driven by a V shaped belt from a pulley, keyed to an extension of the cam shaft. An easy adjustment makes it possible to tighten the belt if necessary.

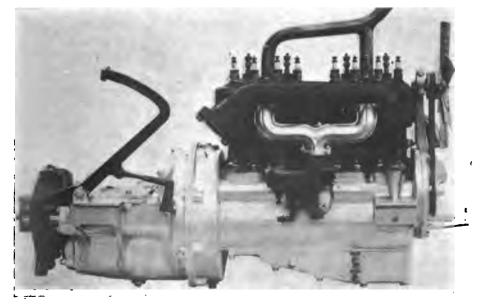

Two independent ignition systems are pro-

ing shaft, which shaft is mounted on imported ball bearings. All high tension cables are carried in insulated brackets. The timer in connection with the storage battery circuit runs on ball bearings and is driven from the magneto driving shaft by spiral gears.

The lubrication of the motor is by a constant feed system and operated by a selfcontained gear pump. A reserve reservoir is located underneath the crank case proper, from which the oil is pumped through a copper tube to the sight feed on the dash, from which it is fed by gravity into the two compartments of the crank case, where a constant level is maintained. The lower tips of the connecting rod bolts dip into this oil and throw it to all parts within the case and pistons. A strainer is provided in the reserve reservoir, so that foreign substances are not drawn into the system. The gear pump is driven by the same spiral gear which drives the timer.

#### CLUTCH AND TRANSMISSION.

The multiple disc type of clutch is used. The discs are steel on steel and operate in a bath of thin oil. The driving discs have projections on their outer periphery, which fit into grooves on the flywheel. The driven discs have projections on their inner periphery which engage in grooves on the clutch driving spider. The friction between the driving and driven discs is maintained by the pressure of four coil springs which are carried on a spider. These springs are accessible through a hand hole in the clutch case, and it is only a few minutes' work to adjust them if necessary. The clutch driving spider is secured to a hexagon shaft

HERRESHOFF POWER UNIT.

FRONT VIEW OF MOTOR.

which engages the transmission sleeve, through which a hexagon hole is broached. The clutch is disengaged by a single pedal which also operates the service brake. Owing to the system of leverage used only a light foot pressure is required to operate this pedal.

The change gear is operated on the selective principle. The gears are made of nickel steel, properly heat treated. The face of the gears has been increased to insure abundant strength and facilitate meshing. The bearings in the transmission are of imported ball type. The transmission case is of aluminum and well ribbed. It is shaped to meet the rear end of the crank case, to which it is securely bolted.

The gears operate in a bath of lubricant. There are three speeds forward and one reverse. Gear shifts are made with a hand lever at the driver's right, operated through the usual type of "H" plate. Locking devices are provided which absolutely prevent more than one set of gears meshing at one time, and an additional device retains the gears in mesh when so placed. The gear case is rendered accessible by lifting the floor boards.

The rear shaft of the transmission carries the transmission brake drum, to the hub of which is secured a coupling in which a square hole is broached. Into this the front end of the propeller shaft engages, through a spherical square. This forms universal connection, which takes care of the disalignment due to spring action. The entire driving mechanism is encased in a concentric tube. To the upper end of this concentric tube a spherical ball is attached which is free to rotate in any direction in a casing, securely attached to the frame cross mem-

ber. The lower end of the concentric tube is rigidly bolted to the bevel gear housing on the axle.

#### AXLES.

The rear axle is of a semi-floating type. Timken roller bearings are used throughout. The bevel gear housing is a malleable iron casting with a removable cover at the back through which the entire differential, with bevel gear, may be removed. The axle tubes are tapered and securely riveted to the housing at one end and pinned and brazed on the brake spiders at the outer end. A truss rod is provided to prevent sagging. The differential is of the bevel gear type. Adjustments are provided so that the gears may always be kept in proper mesh. The axle shafts are of heat treated steel. The ends which fit into the differential housing are hexagonal. The outer ends are tapered, and to them the wheel hubs are secured with castellated nuts.

The front axle is a single piece drop forging of I beam section. The knuckle pins are hardened and ground, and provisions are made for proper lubrication. The front wheels run on Timken bearings. The steering cross rod is behind the axle, and the side steering connection passes over the axle.

#### FRAME AND SPRINGS.

The frame is of channel section pressed steel, arched above the rear axle to provide increased spring action with the body of the car hung low. There are four cross members, well secured to the side rails with substantial gussets. A rigid sub-frame carries the power plant. The semi-elliptic type of spring is used. The rears are shackled at either end and do not transmit the draught from the axle to the frame.

#### BRAKES AND STEERING GEAR.

The car is equipped with two sets of brakes. The service brake acts on the rear transmission shaft and is operated by the pedal. The brake drum is 6½ inches in diameter by 2 inch face and revolves at engine speed when using the high gear. The gear reduction in the rear axle is 4½ to 1, and this brake is therefore very powerful. The emergency brakes act on drums attached to the rear wheel hubs. They are internal expanding and lined with a cop-

REAR VIEW OF MOTOR

per-asbestos lining not destroyed by heat. The service brake also has this same lining. The emergency brake drums are 10 inches in diameter, with an effective face of 2½ inches. A substantial hand lever, with ratchet stop, operates the emergency brakes, and is, in all positions, within easy reach of the driver. In both systems of brakes provision is made for adjustments.

The steering gear is of the worm and sector type. The steering wheel is 16 inches in diameter, the spider being of aluminum. A small lever for the throttle control and also a second lever for the timer control are placed above the wheel in convenient positions. The steering post is well anchored to the dash, and the whole mechanism is rigid and substantial. Provision for taking up wear in the worm is provided. The side steering connection has a ball socket at either end into which the steering lever engage. Shock absorbing springs are provided in the front end of the connections so that sudden shocks from the road are got

REAR AXLE.

smitted to the steering gear proper, working joints are covered with leather ts which are packed with lubricant.

BODIES AND EQUIPMENT.

election may be made from three types podies—touring, tourabout and runabout. I dash and body trimmings are of Cirian walnut. The coil box is made of same material to match. The touring seats five people, the tourabout four and runabout three. The rumble seat at the of the runabout is securely attached to tool box, and sets well away from the it seat. The equipment includes two e acetylene gas lamps with Prest-Otank, two square dash lamps and a stantial tail lamp. A high grade deep

seventh street, New York city, have three new models for 1910, the chasses of which will be first shown at the Grand Central Palace Show. These chasses have been received direct from the London Olympia Show. Two of these are four cylinders and the third is a six. One "four," of 10-12 horse power (French rotary), has cylinders cast en bloc. They are of 2¾ inch bore

American roads, and its motor has probably the longest stroke in proportion to its bore of any car that will be shown here this season. The bore is 4½ inches and the stroke 6½ inches. Besides the long stroke feature the car has a straight front axle with 10 inch road clearance, and 128 inch wheel base. The cylinders, being cast in pairs, have spacious water jackets and are cooled

SIDE VIEW OF RENAULT CHASSIS.

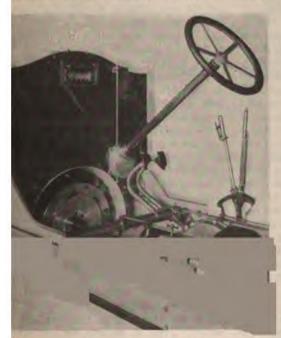

ed horn is provided. A full quota of cel plated tools will be found in the tool ; tire pump, tire repair outfit and jack included.

nless otherwise specified, 32x3½ inch helin flat tread tires on Goodyear quick tchable rims will be furnished on all tels. Customers may choose, however, rgan & Wright, Goodrich or Diamond s of the size specified.

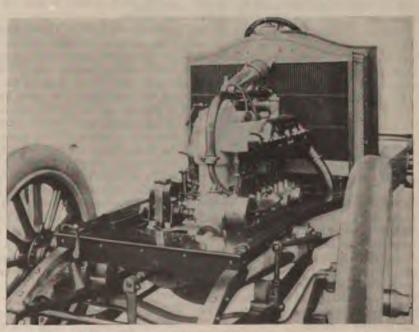

#### Renault 1910 Models.

he Renault Frères, whose American iquarters are at Broadway and Fiftyand 4½ inch stroke. The wheel base of this car is 99 inches. The other "four," of 25-35 horse power, has cylinders cast in pairs, with 4½ inch bore and 6½ inch stroke. It has a 128 inch wheel base. The six cylinder car, of 18-24 horse power, has cylinders cast in triplets, with 2¼ inch bore and 4½ inch stroke. The wheel base of this car is 120 inches. Except for bore and stroke, number of cylinders and the wheel base, these cars are all built along the same general lines. The four cylinder, 25-35 horse power American Special has been designed and constructed especially for

by the thermo-siphon system, which has been used by the Renaults from the beginning. The water connections are extra large, much larger than those generally used on American cars using the same systems. The valves are all on one side and operated by a single cam shaft. The inlet and exhaust manifolds are both on the same side, but the carburetor is located on the opposite side and set very low. Connection with the inlet manifold and carburetor is made by means of a long curved pipe of liberal proportions, which is carried up and over the cylinders between the two members or cast-

E PORTION OF CHASSIS, SHOWING FLYWHEEL FAN, GEAR BOX AND BRAKE.

FRONT VIEW OF CHASSIS, SHOWING MOTOR, RADIATOR AND MAGNETO.

ings and then down to the inlet manifold. Each set of cylinders has its water outlet connection over the centre cylinder, which is bound to be the hottest. The crank shafts are machined from a solid ingot of special steel and have three plain bearings. The main bearings are of phosphor-bronze lined with an anti-friction metal. The cam shaft is also turned from a solid bar, with the cams formed integral, and has plain bearings similar to those on the crank shaft.

These cars are all equipped with the well known Renault type of tubular radiation located back of the motor, forming the dash. The hood is hinged from the radiator front and fastens to the sill plate above the frame and the tight pan, underneath the motor. forms an air shaft through which the air is drawn by the fan shaped flywheel. The rim of the flywheel has pressed steel blades attached to it. All parts of the car are lubricated from the oiler, which is inside the radiator, feeding by gravity; one pipe leads to the front bearings, one to the centre bearing, one to the flywheel bearing, one to the transmission case, one to the differential and one to the self starter when fitted to the car. A knob placed in front, on the side of the crank case, makes it possible to drain the crank case of oil without getting under the car to do so. This same knob when placed in the "communication point" opens the partition in the crank case so as to equalize the level in all. When the car is going up hill, the partitions being closed, the oil does not go to the rear cylinder, but remains at an equal level in each. The same knob when placed in the "overflow" point permits of draining off excess oil. Ignition is by high tension magneto, no coil or battery being used. There is no spark central lever.

#### The Swan Handy Curtain Clip.

This handy little device, which has been placed on the market by the Detroit Auto Shield Company, of Detroit, Mich., consists of a clip by which a rain curtain can be attached to a wind shield, thereby enclosing the driver's seat for protection from storm and wind. The curtain can be easily attached from the seat. The clip is made of spring brass and can be easily attached

to the curtain by anyone. It is attached to the curtain by two little plaits which go through a slotted metal washer, holding the fabric between the washer and clip. This arrangement holds the fabric without any undue strain in one place. The clip itself is formed to a shape smaller than the bead of the wind shield, and when pressed over the edge of the wind shield holds the curtain securely in place.

#### The Warren-Detroit.

The Warren Motor Car Company, of Detroit, Mich., announce for the season of 1910 a 26-28 horse power, four cylinder model. This new car follows approved, up-to-date lines in its design. It is built primarily as a roadster, although other styles of bodies will be furnished. A number of line drawings have been furnished, and this allows of quite a detailed description.

#### THE MOTOR.

With its cylinders cast en bloc and valves all on the right side the motor is very compact for its bore and stroke, which are 4 and 4½ inches respectively. The cylinders are cast with water spaces between and with the top of the jacket open for core support and jacket cleaning. The crank case is in two parts, of which the lower serves as an oil pan. The crank shaft has two bearings of Parsons white brass. These bearings have caps of aluminum, which are ribbed to ensure stiffness.

Four rings are used at the top of the pistons and three oil grooves are turned in the bottom. The hollow wrist pins are secured by a through screw locked by a cotter pin. A slot in the top of the rod permits oil to reach the top of the pin bearing, while a hole in the bottom of the pin feeds the bottom side.

The cylinders and crank pins are lubricated by splash. The oil level in the case is maintained by a plunger pump. Referring to the section of the engine, A is the piston, carrying the usual ball valve. Oil is taken in through strainer B. The downward movement is produced by eccentric C and the piston is raised by the spring surrounding it. The oil is discharged into the timing gear case, from which it flows over dam E when the proper level is reached. After filling the crank case to the required height the overflow returns to oil chamber F. The oil supply may be replenished by removing cap D, which is held in place by the split central pin.

The crank shaft is a drop forging with 2 inch diameter pins and 134 inch bearings. Its rear end is flanged and carries the flywheel, which contains the leather faced cone clutch. Three bearings are provided for the cam shaft. The cams are ground in place on the shaft. The tappets are of square section with rounded ends. Valve clearance is adjusted by set screws. Cooling is by water, using a vertical tube radiator and a centrifugal pump. The fan is driven by a flat belt. A dual system of ignition is provided. It consists of a Volta high tension magneto mounted at the rear of the pump, a set of dry cells for reserve current supply and a single coil in a mahogany box on the dash. A kick-out switch is provided. Fuel is supplied to a Gould carburetor from a large tank under

#### THE CLUTCH.

The clutch has a 21/2 inch face and is of liberal diameter. Easy engagement is

secured by springs under the leather. These springs, lettered C in the clutch assembly, are curved so that when the clutch is disengaged they press the leather outward. The distance they can press it away from the cone is regulated by adjusting nut B on stud A. The clutch runs on a Parsons white brass bushing when disengaged, and the spring pressure is taken by a ball thrust bearing. A double sliding joint connects with the change gear. The throwout collar is of bronze working in a hardened steel groove. The clutch pedal may be adjusted to its proper position by screws A and B.

#### THE CHANGE GEAR.

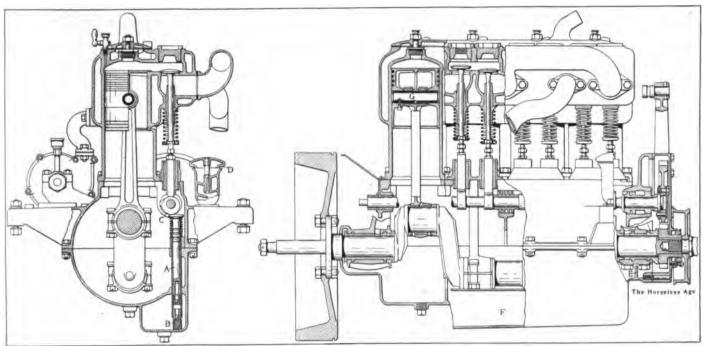

The change gear case is also of aluminum, split horizontally. It gives three speeds and a reverse on the selective system. The gears are of high carbon steel, carefully hardened. The shafts are of cone steel, carefully ground. The shaft for the sliding pinions has four integral keys. Parsons white brass is used for the bearings. A sliding finger, operated by a hand lever working in an H quadrant, shifts the gears in the conventional manner. Referring to the assembly, shafts A and B are locked fast to the case; shifting forks D and E slide over them. Plate C is also fastened to the case. A hole in C contains ball F. which locks either D or E when the other is moved from the neutral position. The gears are located in the neutral position by balls, such as G, carried in the hubs of the shifter forks.

#### RUNNING GEAR.

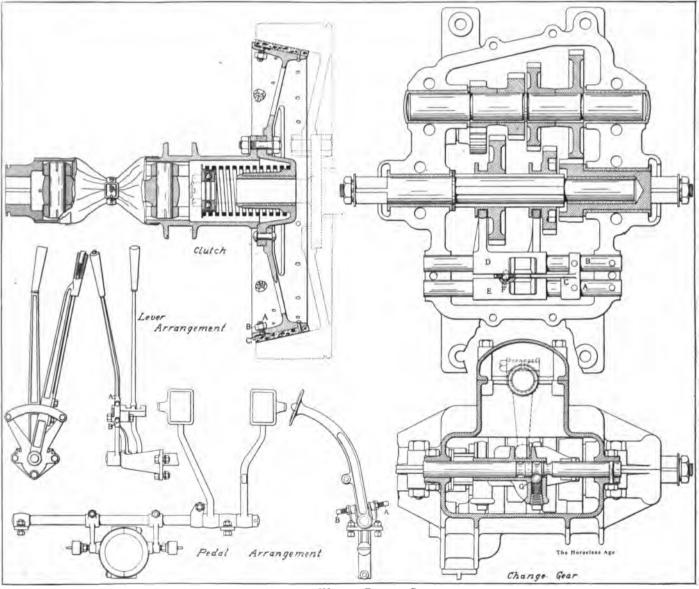

The rear axle is of the semi-floating type, with bevel driving gears of a ratio of  $3^{1/2}$  to 1. The torque is taken on the casing for the propeller shaft. This shaft is squared into a Spicer universal joint at the rear of the change gear. Hyatt roller and ball bearings are used. The front axle is an I section forging. The knuckles are cross connected in front of the axle, and the connection to the steering gear is brought above the axle on the right hand side. Cup and cone ball bearings are used in the front wheels.

The front springs are of the semi-elliptic type, 36 inches long and 13/4 inches wide. At the rear the popular three-quarter elliptic spring is used, the dimensions being 45x13/4 inches. The frame is a typical pressed steel construction. The side members ars 3½x1½ inches, of a special stock sh inch in thickness. They are dropped just in front of the rear axle. Motor and change gear are carried on a channel subframe, which is joined to the main frame by two flat sheets of steel which serve to complete the dust pan.

Both contracting and expanding brakes are on the rear axle. The rocker shafts are placed one in front of the other instead of being arranged concentrically, as is the usual practice. The hand lever A for operating the emergency brake is placed between the change gear quadrant and its sector. Pawl B engages the ratchet as

Моток.

PARTS OF WARREN-DETROIT CAR.

shown. This is somewhat simpler than the usual arrangement. The steering gear is a worm and sector fitted with a 16 inch hand wheel with mahogany rim, Spark and throttle control are mounted above the wheel. Brakes, clutch and gears are controlled by the usual arrangement of levers and pedals, while the motor is accelerated by a foot button.

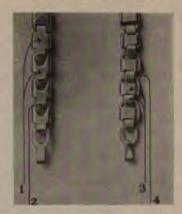

BODY AND GENERAL DIMENSIONS.

The seats are low and divided; they are upholstered with blue-black pebbled grain leather. The standard color is a royal blue, striped in red. The gear is a quiet red, striped with black, and the fenders are enameled black. The steps are of sheet metal.

The wheel base is 110 inches and the tread 56 inches; 32x3½ inch tires are used on the roadster, and 33x4 on the demi-tonneau. Both front and rear wheels have twelve 1¾ inch spokes. The equipment includes a full set of large gas and oil lamps, horn, tools, tire repair kit, pump and jack.

#### Holsman Delivery Wagon.

The accompanying cut shows a new style delivery wagon brought out by the Holsman Automobile Company, Monadnock Building, Chicago, for 1910. The mechanical features are substantially the same as on the 1909 models. Among the special features of Holsman delivery cars are the removable power plant, and the fact that the entire floor space is available for load carrying purposes. The Holsman Company made a distinct change in their various models in 1909, accomplishing an absolutely direct drive on both high and low speed, and also bringing forth the only all ball and roller bearing motor on the market.

r, Flat surfaces lying against the tire; z, portion of connecting link curves, extending away from the tire; 3, inside of chain coming against the road; 4, link of chain passing through another link inside a little box.

Four views showing the last movements used in fastening.

FOX TIRE CHAIN AND FASTENER.

#### The Fox Anti-Skid Chain.

A novel tire chain, which is claimed by its manufacturers to not only absolutely prevent skidding but wear for upward of 3,000 miles, has just been placed on the market by the Fox Metallic Tire Belt Company, Broadway and Sixty-eighth street, New York. For chains are made of flat links of steel stamped from especially manufactured tool steel. These links are bent and interlocked, making broad bands, flat on one side, but with small square projections on the other side. The flat side goes against the tire. The flat connections between the links do not touch the tire, curving away and upward to the interlocking point. Nothing except a broad, flat, smooth metal surface touches the tire.

The wearing surface of the Fox chain, or the part which comes in contact with the road, is a series of flat discs about 1 inch square. They are like the treads on a studded anti-skid tire, but being square instead of round, are claimed to have better gripping power.

The steel links of the Fox chain are shaped like little square boxes with the ends hooked together instead of being shut up. These ends, instead of extending out flush with the wearing surface of the chain, are sunk lower, and the curve of the interlocking point brings them still further away from the road surface.

These links curve under the flat road treads, and are between them and the surface of the band which fits against the tire. In other words, the connecting portions of the links are inside the box and protected against road wear or the impact of road obstacles. Moreover, they are broad and flat, and they offer a far greater wearing surface to each other than do round links.

The flat links cross chains are fastened to flat steel wire chains which extend around both sides of the tire near the rim. These are far removed from the road surface and act as a strong protection to the sides of the tire when driving in frozen ruts. The ends of these side chains are brought together and locked by the Fox patent chain clamp, a simple fulcrum lever terminating in a powerful clasp. This fulcrum lever slips easily through a link of the side chain, one easy motion tightens the whole and clasps the clamp in place. By moving the clamp up one link all slack occasioned by stretching or wear can most easily be taken up. In applying the chain no tools are necessary and the wheel need not be jacked un

The American Machine Company, of Ean Claire, Wis., have been incorporated with a capital stock of \$50,000 to manufacture automobile accessories. The company controls the patent rights of the Indian spark plus. This plug is insulated with pipe stone, which when chemically treated is claimed to become an absolute non-conductor. It is claimed that this material can be heated to a white heat, and then be thrown into for cold water without cracking it or otherwise affecting its insulating qualities.

HOLSMAN DELIVERY WAGON.

#### isconsin Manufacturing Company's Two Cycle Motors.

e Wisconsin Machinery and Manufacg Company, Milwaukee, Wis., are ofg for the 1910 trade a line of valveless cycle motors in sizes of 16, 25 and 35 power. The accompanying cuts illusthe four cylinder 4½x4½ inch motor leasure and commercial vehicles.

e cylinders are cast separately. The set port top is three-quarters of an above low piston position and the top of the third or transfer port is half an above low piston position; the intakes nine-sixteenths of an inch open when siston has reached its highest point. compression space has round top corand with the cylinder full of pure, air and the crank turned at about 80 ations per minute the gauge shows 74 as compression. The exhaust chams completely water jacketed. Provision made for relieving the compression eans of relief cocks.

pistons are 53/4 inches long, and have three-eighths of an inch rings at the with three-sixteenths of an inch lands en, and one three-eighths of an inch at the bottom. After many trials of ent deflector forms and placing, the tral face with rounded corners against ylinder wall, reaching the bent radius the port opening, was adopted. The tor is cast on the piston top, is 13% s high and directs the incoming gases st the cylinder head. The piston top deflector are hand finished by filing, ing and polishing with emery cloth, to avoid pre-ignition. The piston are turned eccentric, one-eighth of an thick, cut at 45 degrees, and held by a sixteenths of an inch pin from turn-

e connecting rods are steel drop forgof I section, and are 93% inches from to centre. The piston pin is of 11% s diameter, of steel, hardened and id, and is clamped to the upper end e rod with a seven-sixteenths of an

inch clamp bolt passing through the side of the pin. A five-eighths of an inch hole is drilled the whole length, through which the pin is oiled from the cylinder coilers. In the centre of the bearing journals oneeighth of an inch holes are drilled for leading oil to the phosphor-bronze bearings. These bearings are of extra large proportion. The connecting rod lower ends are capped, the caps being held by two sevensixteenths of an inch bolts, double nuts, split pin retained. The rod boxes are of die cast white metal. Each piston and connecting rod is machined to a given weight, so that they can be interchanged without throwing the motor out of balance.

The crank shaft is made from open hearth steel with five main journals of 15% inches diameter. The two front crank pins are 180 degrees apart and the two rear pins are also 180 degrees apart and are set 90 degrees behind the front pair. The firing succession is 1, 3, 2, 4. The centre bearings are 25% inches long and are plain half boxes with caps and liners. The main or side bearings are 434 inches long and flanged. The front bearing is solid; the rear bearing is made in halves. All bearings are die castings of white metal. The shaft is mechanically balanced by steel cast balance weights held to the shaft by means of slots and tongues and retained by three-eighths of an inch bolts through the weights and the shaft

The crank case is cast of aluminum alloy. The motor base has four long supporting arms 3 inches wide, designed to hang on top of the engine frame or main frame. The cylinder face is bolted with four one-half inch studs directly to the motor base, without packing. The oil base is provided with four large hand holes for inspecting the connecting rods. Provision is made for draining the oil. Attention is called to the enclosing of the gears which drive the water pump, oiler and commutator on one side and the magneto on the other, in an oil and dust tight case, cast integral with the crank case. These gears have fine pitch teeth and are of phosphor-bronze. The exhaust

manifold pipe enlarges as it nears the muffler pipe, this taking care of the expansion of the exhaust gases. The intake pipe manifold is cast of brass. Both manifolds are fastened with four steel spanners.

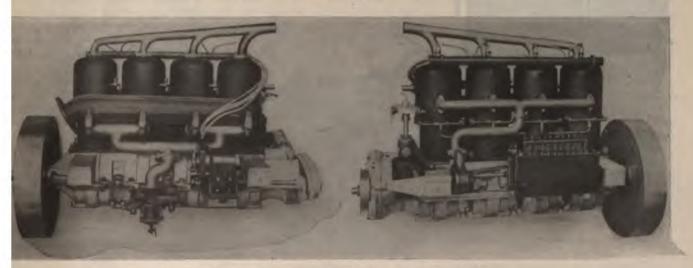

The flywheel is bolted on the crank shaft flange, is of 17½ inches outside diameter and designed to fit a 15¾ inches diameter, 12½ degrees and 2½ inches face standard cone clutch, but motors can be furnished with flywheel to suit any transmission device. The ball bearing fan is of 16 inches diameter and is driven from the magneto shaft by a three-quarters of an inch flat belt; it has six aluminum vanes 4 inches wide with a ring in one piece, and makes 2½ turns to one of the crank shaft. The fan bracket is mounted on the first cylinder and is adjustable for tightening the belt.

Lubrication is by mechanical oiler with nine feeds of the valveless double plunger type, forcing oil from the sight feed to the delivery points. The oiler is set on the motor base and is driven by a horizontal half time shaft. The cylinder wall is oiled from both sides. Grooves are turned in the piston and piston rings, into which oil is forced during the upward and downward travel.

The motors are fitted with two absolutely independent ignition systems. A Bosch high tension magneto and a Connecticut timer are used. The magneto bracket is designed to accommodate either a Bosch or a Remy high tension magneto, or a dual ignition magneto of any make.

The Wisconsin valveless motor is built in two, three and four cylinder models of the same bore and stroke, using the same cylinder casting. The three models are claimed to give 34 horse power, 25 horse power and 16 horse power, respectively, all at 1,200 revolutions per minute. The speed ranges from 200 to 2,000 revolutions per minute.

The Wisconsin Machinery and Manufacturing Company are also placing on the market a four cyclinder, four cycle, water cooled 4x4 inch motor, with cylinders cast "en bloc," which will be described in another

Two Side Views of Wisconsin Four Cylinder, Two Cycle Motor.

#### The Ewing Motor Cab.

The Ewing Automobile Company, whose factory is located in Geneva, Ohio, have recently made their 1910 announcement. They will continue the manufacture of the cab or town car which they brought out a year ago with various minor changes, as will appear from the following description:

The running gear frame is of pressed steel, of five-thirty-second inch stock, and 41/2 inches depth of section from end to end. The frame is considerably narrowed in front, being 26 inches in width between the front wheels, while the rear portion is 34 inches in width, and is raised 5 inches above the front level. The bend in the frame member is very long, and is reinforced by widening the flanges. The frame is supported on semi-elliptic front springs 36 inches long by 2 inches wide, placed directly underneath the frame members, and three-quarter inch elliptic rear springs 42 inches by 2 inches wide. The top quarters of these springs are provided with scroll ends, while the lower spring member is rotatively perched on the rear axle, and linked to the frame in front. The wheels are 32 inches in diameter, and fitted with 4 inch tires. The wheels are fitted with two point ball bearings containing one-half inch and three-quarter inch balls in front and rear respectively.

The motor is of the four cylinder type, of 3% inch bore by 4¼ inch stroke. The cylinders are cast in pairs with integral water jackets with a large opening on top, which is closed by a cover plate. The cylinders are finished by boring and reaming, while the pistons are finished by grinding. The latter are provided with four packing rings, all of them above the piston pins. The piston pins are of three-quarter inch diameter, hardened and ground, and are fixed in the piston bosses.

The connecting rods are steel drop forg-

ings. The upper ends are non-adjustable, while the big end bearings are of the marine type. The piston pin bearing is bushed with phosphor bronze, while the big end bearings are bushed with die cast half bushings of Parsons white bronze. The connecting rod caps are originally forged together with the rods themselves. They are then sawed off, and one-eighth inch liners are placed between the rods and caps. The crank shaft is an integral forging, with all its bearings of 15% inches diameter. It has three main bearings, and is finished by. grinding all over. The flywheel is secured to an integral flange. The valves are located all on one side, and are interchangeable. They are made of drop forgings. The cams and cam shafts are integral and finished by grinding. The valve lifters are slightly offset with respect to the cams, which is claimed to give them a slow rotary

Ignition is effected by sparks produced by a magneto. Either a true high tension magneto, with both a high tension and low tension winding on the armature, or a low tension magneto with step up coil is furnished at the option of the purchaser. The spark time is fixed, occurring about 20 degrees ahead of the top dead centre. It is stated that the effectiveness of the spark varies somewhat with the speed of the motor, and this provides a certain automatic advance of the firing time.

The lubricating system is a combination of the splash and mechanical circulation system. The two crank pits are kept filled with oil to a certain height by means of overflow pipes through which any excess of oil drains down into an oil tank below the crank chamber. The crank arms, crank pins and connecting rod caps are drilled with three-sixteenth inch holes, and are provided with oil catchers to carry oil from the main journals through the crank pins

and connecting rod bearings. A mechanically driven pump draws oil from the oil tank, and forces it through three leads to the three main bearings of the crank shalt. The oil working through these bearings accumulates in the crank pits. By opening an oil cock the driver may at any time assure himself that the oil is properly circulating. The oiling system is claimed to be reliable in action, and very economical of oil

The cooling water is circulated by a cestrifugal pump, which is coupled to the magneto shaft. The radiator is flexibly supported by two trunnions on the sides and a stay rod on top.

The clutch is of the multiple disc type, and runs in an oil bath formed in the flywheel. Both the discs and the casing of the clutch can be removed without disturbing any other parts. The change gear is of the selective sliding type, giving three forward speeds and one reverse. It is connected to the clutch by means of a universal joint. The pinions of the change gear are cut from chrome nickel steel with 6-8 pitch teeth, and 7/8 inch and 1 inch width of face. They are oil tempered. The gear shifting quadrant is located in the middle of the car, and is secured directly to the aluminum gear box. The latter has a large hand hole cover, which when removed permits of a thorough inspection of the gears.

The drive to the rear wheels is by shaft and bevel gears. The propeller shaft is of 118 inches diameter, and is carried in a heavy steel tube of 234 inches diameter, which serves as a torsion rod, the rear end of the tube being pinned and brazed into the hub of a flange bolted to the beed gear housing. This flange is bored out to receive a New Departure double ball bearing, which when the drive is assembled is located directly back of the driving bevel pinion. The front end of the propeller shaft sleeve is pinned and brazed in a flanged hub from which run diagonal braces to lugs integral with the rear axle housing. This foward flange is also bored to receive a New Departure ball bearing which supports the front end of the propeller shaft. At the forward end of the propeller shaft there is a universal joint which has a spherical seat secured to the rear cross member of the frame. The differertial gear is of the bevel pinion type, containing four pinions. The hubs are carried in two point ball bearings, which can be adjusted to insure correct mesh of the driving gears.

The rear axle driving shafts are open hearth steel forgings, squared at their inner ends to receive the square broached hubs of the differential side gears. Forged integral with the outer ends of the driving shafts are the hub driving clutch plates. The live axles are 1½ inches in diameter, heat treated, and so arranged that they may be withdrawn from the car, after the hub caps are removed, without disturbing the

EWING TAXICAB.

other parts. The wheels are carried on the outer ends of the rear axle sleeves, thus giving a so called floating rear axle. The driving gear housing consists of two malleable iron castings, which are joined in a vertical plane, being faced off and held together with eight steel bolts. The rear axle sleeves are pinned and brazed into these malleable iron castings. This construction is said to be of such strength that no truss rod is needed.

The front axle is an I section drop forging with integrally forged steering heads. The pivot pins are seven-eighth inch in diameter, hardened and ground, and work in hardened and ground steel bushings forced into the bores of the steering fork, the pins being fastened in the knuckles. The forks have an opening of 4 inches.

A pair of internal expanding bronze shoe brakes are applied to drums on the rear hubs. These drums are 12 inches in diameter, and have a 2 inch face. The expanding members consist of two semi-circular shoes, which are pivot supported at one end and provided with flat cam faces on the other end. Normally the two shoes are drawn together and out of contact with the drums by means of two coiled springs. The braking surface is thus a bronze steel surface, and a particular bronze composition is used, which is said to work without oil without scratching or cutting. This composition consists of nine parts of copper to one part of tin. The service brake is located on the change gear shaft back of the gear box. It is to inches in diameter by 3 inch face. The contracting member consists of a bronze ring, which is drawn tight onto the drum by means of a rocker shaft carrying two face cams. The service brake is operated by a pedal, while the emergency brake is operated by a hand lever and equalized by a steel cable construction.

The Ewing cab is equipped with left side control. The steering column is located on the left hand side, and the gear change lever and brake lever are in the centre of the car. The other control members include the usua! pedals for the clutch and the service brake, and a small foot lever for accelerating the engine speed. The latter is operated by a sidewise motion of the foot. The steering gear is of the worm and sector type. The throttle is controlled by a ratchet retained hand lever on top of the steering wheel.

The car is provided with either a landaulet or brougham body. The landaulet body, which is the usual type for taxicab services, is built with a 24 inch projection over the driver's seat, the top breaking back of the rear frame of the door, which gives a particularly rigid construction. Either a double driver's seat is provided or a single seat, and half the space in front left for carrying baggage. When the car is intended for private use it is fitted with either a landaulet or brougham body, with the top extending out to the dash and fitted with a glass front.

#### St. Louis Chauffeurs to Form Union.

The death of a pedestrian who was run over by an automobile is said to have given the first impetus for the organization of a chauffeurs' union in St. Louis, which is now under way. The object is to keep inexperienced men and those under twenty-one years of age out of the ranks of professional drivers. C. F. Faulkner, an agent of the St. Louis Taxicab Company, is doing the organizing work.

The new organization will be known as the St. Louis Chauffeurs' Union, and will be affiliated with the Central Trades and Labor Union, of which Owen Miller is president. The initial meeting will probably be held within a short time. The chauffeurs will have in connection with their organization a board of examiners, whose duties will be to examine all chauffeurs and applicants and determine whether they are competent to operate a car.

The taxicab chauffeurs also want wind shields, similar to those on street cars, placed on their cars, but have not decided whether they will advocate a city ordinance making the shields compulsory or make an appeal to employers.

#### Gilbert Manufacturing Company Increase Capital.

The Gilbert Manufacturing Company, of New Haven, Conn., filed notice of an increase in capital stock to the amount of \$50,000. The company recently took over the F. E. Bowers Company, of New Haven, and in the future will manufacture and market the well known Bowers carburetors. The Gilbert Manufacturing Company claim to be the oldest established company in the manufacture of motor car accessories, and to have put on the market the first tire case and tire bracket for carrying spare tires on automobiles.

#### A. M. C. M. C. 1010 Handbook Out.

The handbook of the American Motor Car Manufacturers' Association, giving the specifications of cars made by members of the association for 1010, has just been issued from the press. It contains the names and specifications of products of the six makers which recently joined the A. L. A. M., thus emphasizing the fact that these firms have not withdrawn from the A. M. C. M. A. In fact, officials of these firms hold several of the highest positions in the association. The list of members contains forty-three names.

#### Change in Personnel of Whitlock Coil Pipe Company.

Arthur S. Hyde, president and general manager of the Whitlock Coil Pipe Company of Hartford, Conn., has resigned. James L. Goodwin, the treasurer of the company, will hereafter also act as manager, and Eugene R. Mertens will be superintendent of the plant. C. E. Beach and John B. Murphy have been elected president and vice president, respectively.

#### General Motors Company Gets Detroit Track Concession.

The General Motors Company, who recently bought a large tract of ground on Morrow street, Detroit, on which they plan to erect a large parts factory, were drawn into a dispute with other manufacturers on the same street regarding a concession from the city council for laying a spur track in the street from the company's site to the Michigan Central Railroad. The other manufacturers held that if the General Motors Company were to have the exclusive use of the track in the street they should be required to bear the entire cost of paving the street outside the tracks, but the protestants were willing to bear a certain amount of this expense if they were allowed to run spurs from this track to their factories. An agreement is said to have been finally reached whereby the General Motors Company pays one-third of the \$17,-000 required for paving the street.

#### Next Year's Prince Henry Tour.

The program for the Prince Henry tour for 1910 has been definitely arranged by the German Imperial A. C. and its associated clubs. One of the changes in the rules over this year is that the three point handicap on professional drivers has been abolished. The cars will be officially accepted in Berlin on June 1, and the itinerary will be as follows: June 2, Berlin-Brunswick; June 3, Brunswick-Cassel; June 4. Cassel-Rothenburg; June 5, day of rest at Rothenburg; June 6, Rothenburg-Strassburg; June 7, Strassburg-Coblentz; June 8, Coblentz-Hamburg. There will be two speed trials, the first during the Berlin-Brunswick stage on June 2, and the second during the Coblentz-Hamburg stage on June 8. The latter will be held over a portion of the Taunus circuit between Limburg and Weilburg. Entries at single fees (400 marks) close on April 1, and at double fees on May 1. Strict regulations prevail as to the body shapes and equipment.

#### Stock Car Race Proposal Disregarded by Recognized Clubs.

At the conference of recognized automobile clubs held in Paris on December 7 it was decided that short distance records will in future be valid only if the cars are timed with automatic electric timing devices. The recognized national clubs will buy an electric timing apparatus which they will rent to local organizations under whose auspices record trials may be held. The proposal of the A. C. A. to limit next year's international trials to stock car chasses was rejected, for the reason that it was not received in time for consideration. Each of the clubs is to make a proposal for in international triptyque system by February t. and to use its influence with its own Government for the adoption of such a system which would enable tourists to pass from one country into another without being hampered by customs requirements.

### COMMENTS AND QUERIES OF READERS.

#### Valve Timing Data.

Editor Horseless Age:

In conventional practice what is the earliest and what is the latest point one finds for the opening of the admission valve of a four cycle gasoline motor? I presume that this point is most early in the highest speed motors. Is this always the case? What limits the position at which admission occurs?

Also, can you give me any information as to the effect on the speed and torque characteristics of such a motor when the point of closing the admission valve is varied?

At what time does the exhaust occur and cease, and what is the effect of varying these events in the same way as above?

N. S. SEELEY.

[In our issue for May 20, 1908, we published valve timing data for thirty French motors. The inlet valve opening lag varied from zero to 34 degrees, the average being 121/2 degrees. The normal speeds of these motors varied between 1,000 and 1,700 r. p. m, and it seems that the greater inlet valve opening lag corresponds with the higher speeds of revolution, though, as might be expected, the relationship between the two factors is very indistinct. Thus, for instance, two motors with normal speeds of 1,500 r. p. m. each have absolutely no inlet valve opening lag, while two with normal speeds of 1,300 r. p. m. each have inlet valve opening lags of 20 degrees.

If the inlet valve opens too late the amount of charge admitted will be reduced, for though the suction will then be greater the rate of flow will not be proportionately greater.

The effect of changes in the admission valve closing was thoroughly discussed and illustrated with the aid of numerous diagrams in The Horseless Age of June 30, 1909. The experiments there described were made with a 100x140 mm. motor, with the connecting rod twice the length of the stroke. The inlet valve opened when the piston was 3 mm, on the down stroke. The exhaust valve began to open 8 mm. before the end of the downward stroke and closed at the end of the next upward stroke. It was found that at speeds between 1,000 and 1,500 r. p. m. a lag of 30 mm. in the inlet valve closing gave the best torque, power and fuel economy. It is obvious that this lag is disadvantageous at slow speeds, as with the smaller gas inertia some of the charge is forced out again during the portion of the compression stroke that the inlet valve remains open. The lag of 30 mm. in the above case is equal to an angular lag of 72 degrees. In none of the thirty French motors for which we published data did the inlet valve close as late as this. The inlet valve closing lag varied between

zero and 58 degrees, and the average was about 26 degrees.

The lead of the exhaust valve opening in these same motors varied between 30 and 58 degrees, and the average was 46 degrees. The lag of the exhaust valve closing varied between zero and 20 degrees; it was zero in most cases and the average value was 5 degrees. We have no data concerning any systematic investigations of the effect of varying the time of exhaust valve opening and closing aside from those given by P. S. Tice in THE HORSELESS AGE of October 2, 1907. It is impossible to briefly summarize these experiments, as all of the points determining the valve timing were varied, but the results indicate in a general way that the maximum power of the motor increases as the exhaust valve opening lead is increased to about 45 degrees, and that an exhaust valve closing lag of 10 to 12 degrees gives more power than no lag in the time of closing this valve.—ED.]

#### Easy Starting in Cold Weather.

Editor Horseless Age:

It is hardly necessary to state here that with the present density of commercial gasoline the starting of a very cold motor of large bore is a task to make "strong men weep" and use language "unfit to print."

All this energy can be conserved and the temper of the cranker kept normal by priming the cylinders or the air intake of the carburetor with a mixture of one-half gasoline and one-half crude sulphuric ether. Use a long nosed one-half pint oil can, and carry it on the car with you. Then, no matter how cold the night, or how long the poor car has stood out in the zero air, while you were inside absorbing palate polish or looking into liquid eyes, your pleasure will not be marred by the prospect of having to turn the motor over a few million times, during which you get into a perspiration and afterward catch a heavy cold. It is a veritable Pazaza for the disease of nonstartitis. E. T. BIRDSALL.

#### Stopping Distances.

Editor Horseless Age:

I am anxious to know something about the number of feet within which an automobile can be stopped by the use of brakes, etc., in case of an emergency. Can you advise me whether or not any test along this line has been made, and if so, give the general results? I would like to know substantially within how many feet an automobile weighing from 2,500 to 3,000 pounds can be stopped in case of an emergency, on a good, level, macadam State road, when going 35, 30, 25, 20 and 15 miles per hour. Of course, I assume the driver throws the

clutch out and applies all the brakes, and does whatever is necessary to stop his machine in the shortest space. Can you give me any information or inform me where I can find out?

[Brake trials to determine the minimum distance in which an automobile can be brought to a stop by the use of the brakes, from various speeds, were held under the auspices of the Automobile Club of America on Riverside Drive, New York city, a May 1, 1902. The results show that the distance in which the car can be brought to a stop varies substantially as the square of the speed. From a speed of 10 miles per hour the car can be stopped in 15 feet; from 15 miles per hour in 34 feet; from 20 miles per hour in 60 feet; from 25 miles per hour in 94 feet; from 30 miles per hour in 136 feet, and from 35 miles per hour in 184 feet. These figures are averages. A full report of these trials appeared in Tax Horseless Age of May 7, 1902. Trials held with different types of horse vehicles at the same time showed that they required a greater distance than the automobiles to come to a stop from a given speed.

Similar trials were held in Philadelphia in June, 1902 (reported in THE HORSELESS AGE of July 2, 1902), and in Welbeck, England, on January 11, 1902 (reported in THE HORSELESS AGE of January 20, 1902). The committee of the Automobile Club of Great Britain and Ireland which conducted the latter trials derived the following conclusions from the results of the trials: Considering the average length of vehicles to be 11 feet 8 inches, cars can be brought to a stop:

From 11 to 14 miles per hour in 1 4-5 times the vehicle's length.

From 15 to 17 miles per hour in twice the vehicle's length.

From 18 to 20 miles per hour in 234 times the vehicle's length,

From 20 to 25 miles per hour in 3½ times the vehicle's length.

The A. C. of Great Britain and Ireland did not give out the actual results of each separate test, but simply the conclusions drawn from these results.—ED.]

### Formula for Combined Torsional and Bending Stresses.

Editor Horseless Age:

Will you, through the columns of your valuable paper, explain the method of calculating combined stress in a shaft subjected to torsion and bending, as well as mention a text book that treats the subject clearly?

S. C. H.

[The following formula is taken from Mansfield Merriman's "Mechanics of Materials," published by John Wiley & Sons, New York, which may be recommended as a clear and concise treatise on the design

of beams, columns, shafts and similar simple structures:

$$a^{6} = \frac{16 \text{ M}}{\pi t} + \frac{16}{t} \sqrt{\frac{M^{3}}{\pi^{2}} + \frac{402,500,000 \text{ H}^{2}}{n^{2}}},$$

where d is the diameter of the shaft in inches, M the maximum bending moment of the transverse forces in pounds-inches, H the number of transmitted horse power, s the number of revolutions per minute, and t the safe working stress (tensile or compressive) of the material.—Ed.]

#### Assembled Cars.

Editor Horseless Age:

I was much interested in the article by E. J. Bartlett on "Building a Car from Standard Parts," and can heartily indorse all that he says. One point that he mentions cannot be too strongly impressed on parties new to the automobile business, who contemplate building a car of this kind, and that is the fallacy of supposing that it is a simple and easy task to make a good car from stock parts.

It is true that any amateur can put together a near-car that may seem to be good, but to make a car for the market that will stand up and meet the criticism of the motoring public and not be a mark for the knocks of competitors is quite another matter. Only an engineer of experience with a full knowledge of the requirements and the qualities and adaptability of the available material will make a success of this type of car.

A point that Mr. Bartlett did not mention is that some concerns after having the first car designed by a competent man do not think it necessary to continue his services, with the result that changes are made in the subsequent models that either increase the cost, delay deliveries or spoil the car, or all three.

Every carriage builder who contemplates going into the automobile business should memorize Mr. Bartlett's article, and also remember that brains as well as wood and steel are necessary in a car.

EDWARD T. BIRDSALL, M. E.

# Mr. Cooper's Adjustable Wrist Pin Bearing.

Editor Horseless Age:

Referring to the contribution by W. F. Cooper on "Adjustable Piston Pin and Valve Plunger Design," in your issue of December 8, in Fig. 1 is sihown a cross section of a cylinder, piston, connecting rod and a suggested piston pin. Will you please explain how the pin is assembled with the connecting rod and piston? The only solution I have been able to reach is that the upper connecting rod bearing is capped, instead of being solid, as would be inferred from the drawing. If this is the case, however, there would seem no need for the rather elaborate means offered for adjust-

ment, as the bearing could be adjusted in the same manner as other split bearings.

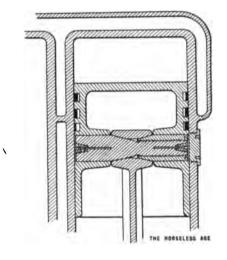

E. F. WARREN.

[We submitted the above letter to Mr. Cooper, who replied as follows:

Editor Horseless Age:

Answering your correspondent's request for information on my method of assembling the adjustable piston pin design, as shown in the December 8 issue of The Horseless Age, would say that the rod was originally put up with a capped bearing. The drawing from which the sketch was made showed this construction, but was improperly sectioned in this view. It was my intention to change this drawing so that the non-adjustable end of the piston pin would be the same diameter as the adjustable cone, enabling the solid connecting rod to be assembled.

With regard to the elaborate adjusting means which your correspondent objects to, would say that on two occasions this has made it possible to adjust a worn piston

pin in not over three or four minutes, and to save tearing down the engine to get at the capped connecting rod.

I venture to say that there are very few mechanics who can tear down and replace a cylinder inside of twenty-four hours, and in the majority of cases it would be a matter of one or two weeks. I believe you will find the average garage would charge at least \$75 or \$100. For this reason I believe the added complication is justified.

Would add that the sketch Fig. 2 should have shown the part 4 as provided with a square thread for the nut 5 to work upon, to prevent excessive adjusting of the upper portion of the bearing. W. F. COOPER.

[Mr. Cooper's estimate of the cost of adjusting or rebushing the ordinary connecting rod upper end bearing is exaggerated. While his scheme, as shown corrected in the cut herewith, is perfectly feasible, we would much prefer the money which it would cost put into an ordinary simple wrist pin of good material and liberal sized bushings also of good material, which, if reliable oil-

ing means are provided, should outlast four or five sets of crank pin and main crank bearings, owing to the very limited and slow motion at the wrist pin bearing surface.

We have had about a dozen other letters calling attention to the fact that as shown the parts could not be assembled. We thank the writers for calling attention to the oversight, but print only the first letter received.—Ep.]

### Horse Power Rating for Taxation Purposes.

Editor Horseless Age:

The new law of registration of automobiles in Massachusetts makes our Ford runabout 22½ horse power. The maker's rating is 15 to 18.

Do you think the A. L. A. M. rating to be nearer than the makers? The A. L. A. M. do not take any account of the stroke, so it makes our engine as much as this year's touring car, which has a five-eighths of an inch longer stroke. I suppose we will have to pay according to their rating, but would like your opinion.

IRVING H. SMITH.

[For purposes of taxation it is necessary to adopt some definite rule based upon easily ascertainable dimensions, and the A. L. A. M. formula meets this requirement. If the authorities went by the manufacturer's rating we would no doubt soon have all sorts of fanciful ratings. The A. L. A. M. formula is intended to give the horse power obtainable from a motor of given cylinder dimensions, built in accordance with the best modern practice, at 1,000 feet piston speed per minute. It undoubtedly gives very close results for these conditions. But some manufacturers choose to rate their engines for lower piston speeds, which naturally gives a smaller rating.—ED.]

#### Causes of Magneto Failure.

Editor Horseless Age:

It will no doubt be of considerable interest to know that for the 1910 season every Napier car will be supplied with a magneto, and in the case of the large six cylinder models magneto and synchronized ignition will be supplied.

During the last four years sixty-three different types of magnetos have been carefully tested. During 1908 thirty magnetos were tested, and of these only four passed the tests reasonably satisfactorily. The method of testing was as follows:

They are first placed on a bench and run by means of a belt at speeds corresponding to the maximum speed they would be required to run at on the engines; that is to say, in the case of the two and four cylinder models they are tested up to the equivalent of 2,000 engine revolutions per minute, and on the six cylinder models up to the equivalent of 3,000 engine revolutions per minute.

Now, just to deal with the tests of last year's magnetos, the following schedule shows clearly the causes of why the magnetos failed:

You will understand that some of the magnetos tested developed several of the faults in one individual magneto, while others only had one single fault.

S. F. EDGE.

### Books on Assembling and Racing. Editor Horseless Age:

Will you kindly give me through the columns of your paper the name of some book dealing with the assembling and dissembling of an automobile; also one on the subject of racing cars, their peculiarities of construction, method of handling, etc.? Thanking you in advance for any information you may be able to give me, I am, M. B.

[We know of no book on assembling an automobile, except the general works on automobile construction, and there are none very comprehensive and up to date in that line. Not much can be said on the matter of assembling in a general way, the work depending so much on the construction of the particular car. As regards racing, the Royal Automobile Club of Great Britain and Ireland is publishing a book entitled "A Record of Motor Racing," which will contain a chapter on constructional details of racing cars. So far very little has been published along this line, as manufacturers always preserve an air of secrecy about their racing machines, but since a number of members of the Royal A. C. are private owners of racing cars it may be possible to get together a good deal of interesting matter under this head.—ED.]

### Unbelievable Economy. Editor Horseless Age:

I am an interested reader of The Horse-Less Age, so for the good of the trade in general I enclose a clipping which I wish you would publish and comment on in your next issue. This is only one of many such statements that are seen from time to time in the space devoted to automobiles. I think it time that such statements be thrown in the waste basket instead of being published for the sake of information to people who know better.

Assuming a high average of 15 miles to the gallon, and a low cost of 10 cents per gallon for the gasoline, and the figures are proved to be impossible.

I know the roads around Renovo, Pa., and am sure that there is not a tire made that will do half that distance without coming to grief, as there is not a good road out of Renovo in any way you wish to travel, except the little brick paving in the borough and perhaps a mile or so east and west. What roads there are are covered with either sand or silica rocks, so how could a tire last half of 36,000 miles—over six times the guarantee on any tire? Furthermore, I would like to lay a wager that there is not an auto there that has run 36,000 miles in fourteen months.

A. D. E.

[The clipping referred to, which is said to be from the Philadelphia *Press* of December 19, reads as follows:

"Charles L. Fullmer, of Renovo, Pa., has written the Penn Motor Car Company telling of the remarkable economy of his ——car, which he ran for fourteen months, covering 36,000 miles, at a total cost of \$134.35, including oil, grease, gasoline and tires. He says that the tires are in excellent shape still."

We have omitted the name of the car, as it is immaterial and the manufacturer obviously had nothing to do with the insertion of the item.

We would not be too severe with Mr. Fullmer, for the reason that it is quite possible that either his stenographer or the compositor made a mistake in the number of noughts, and instead of 36,000 he may have meant either 3,600 or 360. But if he sticks to the 36,000 miles he is certainly a fit member for the Ananias Club—barring the possibility that he steals his auto supplies or does not pay his bills.

—ED.]

### Taxicab Opening in Wilkes-Barre. Editor Horseless Age:

Referring to the article by John B. Mooney, regarding taxicabs in Wilkes-Barre, the writer read this article over very carefully, and must say that Mr. Monney has sized up the situation about right, and without a doubt there is a good opening for a taxicab serivce in Wilkes-Barre, if it is run the same as in other cities. The writer has not the time to devote to this business, but would be only too glad to go over the matter with anyone, and would be willing to assist in getting a good taxicab service started in Wilkes-Barre.

C. L. Davis,

Manager Wyoming Valley Motor Car Company.

### Calculation of Compression Space. Editor Horseless Age:

Why do the different formulæ for figuring the necessary compression space give such different results? I wish you would solve the following problem: A compression pressure of 60 pounds gauge to the square inch is wanted; the engine has a bore of 41/2 inches and a stroke of 41/2 inches; how many cubic inches of compression space is needed?

C. S. H. WESTENBERG.

[The reason that different formulæ give different results is that the compression depends upon the degree of filling of the cylinder at the moment compression begins, which varies with the sizes of the valves and passages, and with the speed of the motor. The compression is not nearly as high at high speeds as at moderate speeds. If we assume that the cylinders are filled to a pressure of 12 pounds per square inch absolute at the moment compression begins, then the compression space necessary to give a compression of 60 pounds gauge in 436x4½ inch motor would be about 27½ cubic inches.—ED.]

#### Electric Vulcanizers.

In connection with the article entitled "How Covers and Tubes Are Vulcanized" in our issue of December 8, C. A. Shaler Company, of Waupun, Wis., call our attention to the fact that electric vulcanizers can be exactly regulated as to temperature, and the vulcanizing temperature be maintained as long as desired, inasmuch as the flow of electricity can be controlled absolutely. This, of course, is impossible with gas, gasoline or alcohol. Owing to the fact that there is no flame the vulcanizer may be used in any position, even bottom side up, so that every part of the tire can be reached while it is still on the wheel; or the vulcanizer can be used flat, which is the natural and easiest position when working on an inner tube.

Every Shaler electric vulcanizer is supplied with an accurately tested thermometer, and also with a shelf on which to vulcanize inner tubes, a flat face for this work, a concave face for vulcanizing casing, a chain and bolts for clamping the vulcanizer to a casing on the wheel, a full set of directions and enough Para rubber and vulcanizing cement to make the first few repairs. The vulcanizer, moreover, has a handle so that it can be easily moved from job to job without waiting to cool it off. It is claimed that 30,000 motorists are using this vulcanizer at present, and that it is in use in about 75 per cent. of the garages of the country.

#### To Build Corliss Cars.

The Corliss Mortor Company has been incorporated at Corliss, Racine County, Wis., with a capital stock of \$1,000,000. The company will build and market a six cylinder automobile, the feature of which is that it weighs 1,000 pounds less than any six on the market. The car will cost \$3,000. It is believed that the Wisconsin Engine Company, of Corliss, which is owned by Eastern steel mill men, is backing the new company All steel used in the car will come direct from the Pennsylvania mills owned and controlled by them. No wood will enter into the construction of the car.

It was reported some time ago that the owners of the Wisconsin Engine Company had purchased the Owen-Thomas Moter Car Company, of Janesville, Wis., and it is believed that the new company is organized with the object of continuing the Janesville concern. The Owen Thomas is a six cylinder car with many novel features.

# Are Mathematical Articles Appreciated?

Editor Horseless Age:

Have just read your editorial on mathematical articles, and hasten to place myself on record as an advocate for the use of mathematics in the treatment of all technical subjects, as far as possible, by all means. I cannot conceive of any logical method of treating the problems of design that come up for publication and discussion other than by mathematics, nor can I see why anyone not versed in mathematical language need care to enter into these matters. Nor can I see how, if anyone is interested in technical problems, he can expect to get very deep until he can handle the mathematics.

I feel that the present discussion will not be allowed to be one sided, as I should indeed regret to lose the accurate and concise mathematical paper for the more flowery, wordy, "leading-nowhere" sort of article that attempts to handle these purely engineering matters without mathematics. I feel that I have as much right to say, "Why crowd the paper full of comments and queries of the novice, etc.?" because they do not interest me.

The policy of your paper in the past has been satisfactory to me. I can only wish you may stir up enough discussion on both sides of this question to induce you to make technical subjects as technical as they can be made, the dilations on "how to run a motor car" just as amateurish as they can be made, and I believe each will be satisfied with the results. I can only suggest that inasmuch as some of the many points discussed by the so called "high brows" may be interesting to a certain class of readers, an editorial take care of this, as has been done before in other papers as well as in The Horseless Age.

Trusting that you will give my words some consideration, and that you get enough letters of like nature to prevent you taking a step that would cause your paper to be less valuable to me.

H. H. KENNEDY.

Editor Horseless Age:

Your editorial on "Mathematical Articles" is read with interest, and as you desire an expression from your readers relative to their desirability, I beg to write the impression of this reader. Although at present I am not connected with the manufacture of automobiles, I have been, and, as an engincer and user, am still interested in their mechanical development. A few years ago, when designing and manufacturing, I turned in vain to technical literature for assistance, and I am still impressed with the fact that there is comparatively little published that is really a scientific treatment of the physics and mechanics of automobile design. The older commercial mechanisms are very thoroughly covered in their respective technical journals, and are continually discussed in a highly scientific manner. THE HORSELESS AGE is the only paper I have seen that attempts to perform this function for the automobile, and I believe it would be a loss to its mechanical development should you discontinue the one feature which has made your paper so valuable to scientifically trained men.

The industry started in this country by largely copying the foreign types of machines, and the early gas engine driven cars showed the results of a combination of the wagon maker's knowledge with that of the skillful, but untrained, mechanic, and the untrained mechanic was in evidence for some time. Of late years cars are showing more and more the results of study by the scientifically trained engineer, and it is this class of workers—the trained engineer—you assist by affording means of communication for the methods and results of their research. I think those of your readers who are not directly interested in the necessarily mathematical treatment of such subjects will gladly allow the space when they realize that ultimately they will be directly benefited by the continued mechanical improvement which the publishing of such scientific discussion makes possible—they will have better cars to sell or to use, as their case may be.

The sporting and trade fields of motoring are well covered in all the journals. I, for one at least, hope THE HORSELESS AGE will continue to give technical, and especially scientifically technical, information.

W. GRANT KING.

Editor Horseless Age:

I have read your editorial on "Mathematical Articles" with interest, and would say that I for one appreciate the technical articles which appear from time to time, and desire by all means to see them continued. I am a draughtsman employed in the automobile industry, and my main reason for subscribing to THE HORSELESS AGE was because it was the only American automobile paper which published to any extent technical articles. THE HORSELESS AGE has a name among those directly interested in the design and manufacture of automobiles as being the best technical automobile paper, and has more subscribers among them than any other paper.

Articles bearing on the design of various parts of the car, such as crank shafts, connecting rods, front axles, etc., which you have published have been very helpful to me. There are no books at present which treat on these subjects, and where shall we get this information if not through trade papers? Foreign papers publish technical articles, one paper, La Technique Automobile, being entirely technical. Why should not some American automobile papers publish them?

I think you should publish at least one

technical article a week. I do not think this would be a greater proportion to the rest of the reading matter in that number than the proportion of those interested in these articles is to those who are not.

HERBERT G. SNOW.

Editor Horseless Age:

In reference to mathematical articles in your paper, I would state that they are of great value to the automobile designer. Almost every designer has some technical hand books, but there is no comprehensive collection of technical data on automobile design. It is advantageous for the designer to secure the data collected by different writers for different purposes, and if the non-technical reader doesn't get any benefit out of these mathematical articles he will get it with his car.

JOSEPH ZAGORA.

Editor Horseless Age:

I note in the issue of December 8 an editorial on "Mathematical Articles." I sincerely hope that you will not discontinue such articles, as with the scarcity of really good books on automobile design, as brought out in your answer to "C. B.," in the same issue, it is often very hard, if not impossible, to get mathematical formulæ which are up to date and reliable, except from such articles, and it was on account of them largely that I first subscribed to your paper, and have kept up my subscription.

W. F. Davidson.

Editor Horseless Age:

Referring to your editorial as to the value of mathematical articles, I can only say that if they were eliminated I would hardly feel like paying my subscription each year, as I can get all the other news without cost. I believe it is a mistake to assume that only engineers and men in the factories read such articles, as I personally know of at least ten owners who are not in any way connected with the trade who take your paper solely on account of the excellence and reliability of its technical articles. The abandonment of this department would probably result in the starting of a new technical paper.

E. T. BIRDSALL, M. E.

Editor Horseless Age:

In regard to your editorial of December 8 on mathematical matter, please note that the reason I have subscribed for The Horseless Age is because of that very article on "Springs," otherwise I would not take the paper. I am a draughtsman in the auto line, and the road and race events are of no interest to me, but when I have taken time to read and study a mathematical article I have not time to sit down and write a letter "knocking" on road arti-

cles. I believe this is why you do not hear from our side of the question. As to putting things into more popular forms than mathematical formul=, if that were possible, as some assert, then the "royal road to learning" would be a question only of time and money, and not of brains and study. If people have not patience to read the deeper articles, let them keep still and let those who will continue to study. Please put in more of such articles as "Calculations of Chassis Springs."

J. F. COYLE.

#### Editor Horseless Age:

Regarding your recent editorial comment on the contrary attitude of readers toward the publication of articles treating of automobile topics mathematically, would say that the publication of these articles, to my mind, constitutes the most valuable feature of your journal. In fact, it was somewhat of a disappointment to me when going over The Horseless Age for 1909 in failing to find a single mathematical article in any of the issues save that on the "Calculation of Chassis Springs."

Why should such a paper as THE HORSE-LESS AGE be outdone by the foreign periodicals, which are filled with technical matter, mostly in mathematical form?

No doubt the multitude of engineers who look upon THE HORSELESS AGE as an up to date authority on automobile topics, and keep same on file for reference, will be unanimous in their protest against the discontinuance of mathematical articles, and would certainly make the editor's ears burn with their adverse comment.

To repeat: by all means keep up the publication of mathematical articles, and let's have at least one in each issue.

ERNEST M. KLUCK.

#### Editor Horseless Age:

I have read your editorial on "Mathematical Articles." Being a subscriber, I take the liberty of writing this letter to you. In the first place, I have subscribed to The Horseless Age because of the mathematical articles published in it. I therefore hope that you will not omit the mathematical articles.

An engineer without a knowledge of mathematics is just like an electrician without tools. Therefore, if you will omit the mathematical articles I feel sure that the engineers will drop their subscription to The Horseless Age as soon as they know of any other magazine that publishes mathematical articles.

SAMUEL HYAM GLUCROFT.

#### Editor Horseless Age:

Having just read your editorial on "Mathematical Articles," I take the liberty of suggesting the attitude of no inconsiderable per cent. of your readers whose position may be similar to my own. An an enthusiastic student of the automobile, I am only too glad to find some article, for example, "Calculation of Chassis Springs," which though in part beyond my depths

is nevertheless a stimulus to the acquirement of a more thorough and technical knowledge than may possibly be gained from the average book or magazine. I believe that anyone who wants to know automobiles at all well wants more than vague generalizations, and the lack of exact specifications and dimensions renders an otherwise interesting article exasperatingly useless. Yours is the only motor publication I know of that is never lacking in this respect.

MARCK BANDLEY.

#### Editor Horseless Age:

Referring to your editorial on "Mathematical Articles," I wish to enter a word of protest against dropping that part of your magazine which gives it prestige and weight. I have frequently heard non-technical men back their arguments for or against some particular motor car construction by quoting THE Horseless Age and the formulæ and deductions from these same mathematical articles. The writer is of the opinion that your mathematical articles are read and enjoyed by a much larger circle than you think. Certain it is that if the articles in question are not a part of what the writer now thinks to be the best all round motor car journal in America, it will fall to the level of \* \* \*. We trust you will continue the articles.

L. P. GILBERT.

#### Editor Horseless Age:

Your editorial on "Mathematical Articles" noted, and would say that to discontinue publishing these articles would detract from the value of your paper. While there are, no doubt, many to whom these articles are of no apparent value, they are greatly appreciated by men in the engineering end of automobile construction. The Horseless Age is the one paper of value to this class of subscribers.

F. W. Slack.

#### Editor Horseless Age:

I wish to inform you that I appreciate very much the mathematical articles in The Horseless Age. I was for years a subscriber to different German and French automobile papers, and they always contained more mathematical articles than The Horseless Age. I would regret it very much if you were to cut out these articles entirely.

C. S. H. Westenberg.

#### Editor Horseless Age:

I have just read your editorial concerning "Mathematical Articles." I think it would be very unwise for you to discontinue them. Why? Well, my reasons for wishing them continued seem to coincide, exactly with yours.

Fred W. Kiser.

#### Editor Horseless Age:

In accordance with the suggestion in the editorial in your last issue, I hasten to express my keen appreciation of the technical and mathematical articles which appear all too infrequently in your valuable paper.

Should you discontinue these articles it would destroy the usefulness of your publication for a large body of subscribers—draughtsmen, engineers and designers—who are entirely dependent on you for such information, since yours is the only automobile paper in the English language which publishes technical articles which are worthy of the name. I sincerely hope the responses to your editorial will be sufficiently numerous to warrant you not only to continue the articles, but to increase their number, so that we may have some article of a technical character in every issue.

GEO. W. HARPER.

#### Editor Horseless Age:

Permit me to express my appreciation of the so-called mathematical articles appearing at times in your paper. I hope and believe that a sufficient number of engineers and designers will write you regarding the value of the articles to them to induce you to continue them.

I wish to ask in regard to assembling of adjustable piston pin, described by Mr. Cooper: Is it meant for a "pigs in clover" puzzle or is the piston split somewhere and then bolted together?

E. W. WEAVER

#### Revere Rubber Company Passes Into Control of United States

Rubber Company. The United States Rubber Company, known as the "Rubber Trust," has secured control of the Revere Rubber Company, in whose works the Continental tires are manufactured. The price paid for the stock is said to have been \$200 per share, at which rate the consideration for the whole issue would have amounted to \$4,000,000. It is expected that the Revere Rubber Company will be merged with the Rubber Goods Company, and that it will operate one of the at present idle factories of the United State Rubber Company, to enable it to increase its output of tires and mechanical rubber goods. The Revere Company has outgrown its present plant, but further enlargements are impossible owing to its location.

#### Fiat Changes for 1910.

There are relatively few changes in the well known Fiat cars for the coming season. Instead of the automatic control, the magneto advance is now direct from the wheel sector. A change has been made on the valve lift guides, which are entirely of steel this season instead of bronze. The lubrication system, which is of the force feed type, while essentially the same as in 1909, has been improved in efficiency by a few minor touches. The only other change noticeable is in the chain drive models, which have completely enclosed chain cases, which are absolutely dustproof and sandproof, thereby insuring better lubrication. A commendable feature, which is continued in all new models, is that the tire sizes for all four wheels of the car are the same.

### THE FIELD OF COMMERCIAL APPLICATIONS.

#### remier Motor Ambulance.

otor ambulance, with a body similar mousine in appearance, has recently aced in service by the A. M. Ragsompany, an Indianapolis undertaking a, and was first used in connection he hospital service at the recent Incilis Speedway races. The chassis is ular Premier four cylinder model, he construction of the ambulance, easy riding qualities and a desire to

#### Pay-as-You-Enter Motor Bus.

The accompanying illustration shows a twenty passenger "pay-as-you-enter" bus, recently delivered by the Knox Automobile Company, of Springfield, Mass., for service upon the Orange street line in New Haven, Conn., where the authorities have declined to grant a trolley franchise. Entrance to the vehicle is through a hinged door, close to the front end and within reach of the motorman, who opens and shuts it by means of

the chassis here used. Instead of the four cylinder, 40 horse power, air cooled engine there stated to be used, the 40 horse power water cooled R engine, described on page 180, Vol. 24, is the one employed in connection with the Knox three speed and reverse selective gear set, which has been designed for specially arduous commercial service.

W. M. Goodrich and M. W. Wagener will shortly establish a taxicab service in Kansas City, Mo., with a number of Croxton-Keeton taxicabs.

The White Oak Coal Company, of Washington, D. C., have placed an order for eight-Studebaker electric trucks of 3 and 5 tons capacity, with which they will deliver their coal.

Ten motor cars are being used out of Prinville, Ore., for stage purposes, where two years ago horse propelled vehicles were used entirely. J. H. Wenandy, of Bend, Ore., has put five autos into stage service between Bend and Shaniko by way of Madras. The Cornett stage line, which has been operated into the interior of Oregon, has put on three new machines, which are kept busy all the time.

PREMIER AMBULANCE.

the attention of the morbidly curious the chief desiderata. When the ambulance is approaching atient's home or hospital, however, curtains are raised, thus removing all rance of an ambulance, and assuming if an elegantly appointed pleasure car. straps and also collects the fares, before the passengers enter the body of the car, so that no conductor is required.

The bus body is mounted upon a Knox standard 2 ton chassis, and it is stated that in future cars of this model the body will overhang slightly less at the rear and slight changes in the rear springing will be made.

A description of this 2 ton chassis will be found on page 751, Vol. 21, of THE HORSE-LESS AGE, which in the main applies to

#### First Indiana Motorcycle Factory.

Indiana will soon have its first plant for the manufacture of motorcycles in the Ko-komo Motorcycle Company, which has just been incorporated with an authorized capitalization of \$100,000. The company will establish a motorcycle plant at once, but the type of machine to be built has not been announced. Those interested in the company are W. H. Gilman, J. D. K. Kennedy, L. C. Woodfill, G. W. Charles and E. A. McGuire.

KNOX TWENTY PASSENGER "PAY-AS-YOU-ENTER" BUS.

### AUTOMOBILE LAW AND LEGAL EVENTS.

# Two Favorable Decisions in Damage Cases Against Motorists.

Where an automobile was being driven on a street from 4 to 6 miles an hour within the speed limit, and the driver did not discover that a horse, which was held by two men, was becoming frightened until after the automobile had passed it, and the horse did not become unmanageable until after the automobile had passed, and the driver did not observe that one of the men motioned for him to stop, but he stopped his automobile after he had passed the horse some 40 feet, and claimed that it would have frightened the horse more to have stopped when the horse first became frightened, it was held that he was not guilty of negligence. Baugher vs. Harman, 66 S. E., 86 (Va.).

The Supreme Court jury in the case of Benjamin Kraus against Dr. Floyd S. Winslow returned what is said to be the first verdict in favor of the defendant in a negligence suit against an automobilist in Monroe County, New York, recently. There was much conflicting testimony. A team which the plaintiff was driving in the East Henrietta road, Rochester, on May 9 was frightened by the defendant's automobile and ran away. Kraus was thrown out and seriously injured. Dr. Winslow's testimony was to the effect that the plaintiff was himself to blame for the accident, having blocked the roadway and refused to permit the defendant to pass. The only other eyewitnesses, besides Kraus himself, were a number of employees of the Ellwanger & Barry nurseries who were being conveyed by the plaintiff to the Ellwanger & Barry farm in Henrietta. Their testimony in effect corroborated the story of the plaintiff.

#### Matheson-Palmer & Singer Suit.

The suit of the Matheson Motor Car Company, of Wilkes-Barre, Pa., against the Palmer & Singer Manufacturing Company, came up for trial before Judge Archibald at Scranton on December 13. The contracts between the two companies were offered in evidence, giving the number and types of cars to be delivered, the number of tests to be made, the method of tests and other details. The Palmer & Singer Company allege that the tests were not made in accordance with the contract. The Matheson Motor Car Company allege that the Palmer & Singer Company defaulted in their contract in 1907 when the financial panic was at its height, and this left the Matheson Company with about half a million dollars' worth of cars on hand which had been manufactured to the order of the Palmer & Singer Manufacturing Company. The Palmer & Singer Company had \$25,000 on deposit with the Matheson Motor Car

Company as a guarantee of good faith, and had also made other payments, making a total of about \$42,000. This the Matheson Company declared forfeited, owing to the abrogation of the contract. The plaintiffs claim \$357,938.28, with interest from January 1, 1908, as damages sustained on account of the non-fulfilment of the contract.

#### Cut Price Dealers Enjoined.

The Circuit Court of the United States for the Southern District of New York has granted an injunction against a cut rate dealer handling the Klaxon warning signals, in the case of the Lovell-McConnell Manufacturing Company et al. vs. the E. J. Willis Company. From the papers on file in that case it seems that the Klaxon signals, which are covered by patents, are sold under a conditional license fixing the retail price of the large model, Type L, at \$35, and the smaller model, Type S, at \$30, with a maximum discount of 5 per cent. for actifal cash, and that certain cut rate houses have recently been selling for retail at a price considerably less than the license price.

The owners of the Klaxon patents decided to make an example, and instituted proceedings against the E. J. Willis Company, against whom United States Circuit Judge E. Henry Lacombe has just issued an injunction as asked for in the bill of complaint. It seems that the Federal law with respect to fixing the license retail price of patented articles is well settled and that the Klaxon people will have no difficulty in stopping every price cutter.

### Fined for Joy Riding in Employer's Car.

One of the first cases in Columbus, Ohio, where a chauffeur was fined for "joy riding" with his employer's car was tried in police court recently before Judge Osborn, and the man, C. G. Noland, was given a fine of \$25 and costs. Being unable to pay the fine and costs he was sentenced to the workhouse to work out the fine. Noland took the car of his employer, Dr. L. M. Early, head of the L. M. Early Automobile Company, and after a chase the police arrested him at 3 o'clock in the morning. His excuse was that he was testing the carburetor.

# Ohio Municipalities Cannot Regulate. Speed.

By an opinion rendered recently by Attorney General Denman of Ohio municipalities have no authority to enact ordinances to regulate the speed of motor cars within their limits. The decision was rendered upon the request of the city solicitor of Collinwood, which municipality sought to enact a speed law. It was held, however, that a

municipality has the right to determine to what zones the State law shall apply, or, in other words, to define what portions are classed as "closely built up and business sections," in which the legal rate of speed is 8 miles an hour. Many Ohio municipalities recently have sought to enact speed laws, with the result that all have been knocked out by the courts.

#### Manufacturers Sue Sales Agent.

The Victor Motor Car Company, San José, Cal., manufacturers of the Sunset automobile, have brought suit against Harrison P. Smith, of San José, to recover losses claimed to have been sustained through an alleged breach of contract on the part of Smith. The company entered into a contract with Smith early in 1907 whereby they were to turn over to him their entire output of 100 cars for that year, to be sold by him. After the contract had been in force for a short-time Smith refused to take any more cars, claiming that the company failed to keep their part of the agreement by delivering improperly constructed cars, and not furnishing them fast enough, whereby, he claims, he lost several sales. The Victor Company claim that Smith broke faith with them by refusing the cars, and they ask about \$1,500 dam-

#### Legal Notes.

The City Council of Terre Haute, Ind has declined to allow an appropriation of \$4,000 for the purchase of a motor fire engine. It is likely the question will be taken up again by the incoming administration, which will take office on January 3.

Under the new Michigan law, which goes into effect on January I, Canadian motorists wishing to drive in Michigan will have to register their cars in that State, the same as resident motorists, because the law grants exemption only to motorists residing in States which grant reciprocal privileges.

A bill has been introduced in the St. Louis City Council by Councilman Norvell to regulate street traffic in St. Louis. The bill was originally drawn by the St. Louis A. C. several months ago, and later indorsed by the St. Louis Automobile Manufacturers' and Dealers' Association. It is based on similar ordinances in force in Chicago and other cities.

Montague Roberts, the well known racing driver, was found guilty in the Criminal Court at Hartford, Conn., on December 15, of violation of the automobile law, and was sentenced to thirty days in jail and to pay a fine of \$150. The case grew out of an accident in Southington on September 17, in which E. L. Kieffer, of New Britain, was badly injured.

### New Records Made at Indianapolis Trials.

John Aitken, driving a National car, established new world's records for all distances from 1 to 20 miles in the Indianapolis Speedway trials on Friday, December The trials were made in a freezing wind, which was extremely hard on the drivers, and finally caused the racing to be discontinued. Aitken's record breaking dash occurred in the 20 mile time event, his time for the whole distance being 16:18.41. Walter Christie ran a quarter mile in 8.37. setting a new American record for the distance, which was immediately broken by Strang in the Fiat 200 horse power racer, whose best time for the distance was 8.05. Strang also made a new 5 mile world's record for oval tracks, viz., 3:17.70. Strang also established a new record for the Indianapolis Motor Speedway by driving I mile in 0:40.61. The previous record for the speedway was 0:43.6, established by Barney Oldfield last August. All records were established on Michelin tires.

Governor Thomas R. Marshal presided at the ceremonies incident to the rededication of the Speedway.

### A. A. A. Meetings During Palace Show.

The first meeting of the new A. A. A. executive committee will be held at the national headquarters, 437 Fifth avenue, Tuesday, January 11. The Good Roads Board of the association will hold a meeting January 5, to be presided over by Chairman George C. Diehl. A gathering of secretaries of State associations and clubs will take place Friday, January 14. Chairman Powell Evans, of the touring board, and Chairman Terry, of the legislative board will have board meetings during the show period. The directors of the New York State Automobile Association have decided to meet in New York City, Thursday, January 13. meetings will be at 437 Fifth avenue.

### Benz World's Speed Record Holder in This Country.

The Benz 200 horse power racing car which established new world's speed records at Brooklands, England, on November 8, as reported in The Horseless Age of November 10, was shipped to this country on the Majestic some time ago, and is now held by the Benz Import Company, of this city. It will undoubtedly compete in the next record trials to be held here. Several slight improvements have been made in the car since the Brooklands trials, and if a good, smooth track is found it is not unlikely that the Brooklands figures will be bettered.

### Another National Drivers' Organization Launched.

The automobile drivers and mechanics of Atlanta, Ga., have organized the National Association of Automobile Drivers and Mechanics, and have applied for a charter. The application for the charter is signed by E. W. Trippe, C. W. McDade, Thomas Lane, A. L. Barry and C. H. Welch. It is said to be the purpose of the members of the Atlanta Association to organize the drivers and mechanics in every large city in the United States, and to make Atlanta the national headquarters.

### Papers to Be Read at Engineers' Meeting.

The following papers will be read at the meeting of the Society of Automobile Engineers, to be held at the Automobile Club of America, on January 4: "A Classical Determination of Change Speed Gear Bearing Loads," by L. C. Freeman; "The Effect of Frequent and Heavy Charging Upon Pasted Lead Peroxide Plates," by Hugh Rodman. The following papers will be

read at the meeting in the Engineering Societies Building on January 13: "Characteristic Curves of Internal Combustion Motors," by B. D. Gray; "The Wider Dissemination of Professional Knowledge and Experience," by Henry Hess, member of the society; "Tests of a 20 Horse Power Franklin Air Cooled Motor," by L. R. Evans, M. E., Syracuse, N. Y., and R. T. Lay, M. E., Ithaca, N. Y. The annual dinner will be held at the A. C. A. on January 4 at 8 p. m.

#### Motor Sleigh Contest.

The A. C. of France offers a prize of 1,000 francs for a competition of motor propelled sleighs, which is to be held by the French Touring Club at Gerardmer in the Vosges Mountains on February 13, 1910, in connection with a week of winter sports at that place. The contest is open to two classes, viz., (1) sleighs with four cylinder motors up to 85 mm. (3.4 inch) bore, or motors with a different cylinder number of equal piston head area; and (2) sleighs with four cylinder motors of more than 85 mm. bore, or a different number of cylinders of equal piston head area. Each of these classes is to be divided again into subclasses, propelled by air propellers and by other means, respectively. The tests will consist of a hill climb over a course 3,000 feet in length, with a maximum gradient of 10 per cent.; a brake test and a speed test of 5 to 6 kms. In making the awards the judges will take into consideration the speed of the sleigh, the motor (adaptability for the special use, in respect to water circulation, lubrication, carburation, speed regulation, etc.), the method of drive, the method of braking and the method of steering. The arrangement of the body, its stability, the number of seats, the solidity of the runners and protection against cold and snow. For sleighs with air propellers a special prize of 500 francs is offered, and the Touring Club will award a gold medal. The entry fee is 50 francs per sleigh, and entries will be received up to February 5 by the contest committee of the Automobile Club of France, 8 Place de la Concorde, Paris.

#### De Dietrich Firm to Be Reorganized.

It is reported that the Société Lorraine des Anciens Etablissements de Dietrich & Cie. is to be reorganized, technically as well as financially. The original capital stock of 15,000,000 francs is first to be reduced to 7,500,000 francs, and new shares are then to be issued to bring the capital stock up to 15,000,000 francs again. The new shares will probably be placed by the banking firm of Nagelmackers & Fils. As regards the technical reorganization, it is stated that the Société Anonyme des Ateliers de Construction du Nord de la France and the Trust Metallurgique of Brussels and Paris will become interested in the firm. The Lorraine stock company was organized on March 1, 1905.

### GARAGE AND SALESROOM.

Garage Notes.
Sacramento, Cal.—Herbert E. Schroeder has secured a permit to open a garage on Sacramento street, between Baker and Lyon streets, despite a vigorous protest from two adjacent property owners.

Denver, Col.-W. C. Fawcett Motor Company will erect a two story, 50x150 foot garage and salesroom at 1249-1255 Broadway the first of the year. The estimated cost is \$25,000.

Washington, D. C .- Rudolph & West will build an addition to their establishment to be devoted chiefly to auto supplies.

Jacksonville, Fla.-Womble & Co. have opened a garage and repair shop in the east end of Holland's carriage

Chicago, III .- The Nyberg Automobile Works has taken a lease of the premises 2438 Indiana avenue for a period of fifteen years, on which will be erected a four story, 63x175 foot reinforced fireproof structure, which will be connected by overhead bridges with the present Nyberg building on Michigan avenue. The combined buildings will have a floor space of 80,000 square feet.

Chicago, III .- The Walden W. Shaw Company, importer of the Berliet car and owner of the Shaw taxicab service, have sold the lease on the salesroom and garage on Twenty-first street to the Oldsmobile Company, who at present occupy the adjoining building, and plan to secure a plot in the heart of the business section on which they will erect a 100x175 foot, four story, concrete garage and salesroom.

Indianapolis, Ind .- William H. Baker has been granted a permit to erect a two story brick garage at 325 North Delaware street. The building will have a floor area measuring 32x120 feet, and will cost \$6,500. The lower floor is to be used as a garage and the upper as a repair shop.

Indianapolis, Ind .- About sixty Indiana agents of the Buick Motor Company were entertained by the Indianapolis sales branch, of which R. H. Losey is manager, during the week of December 13. The agents inspected the 1910 models and were entertained at a banquet at the Columbia Club. On Sunday, December 19, the party was taken in a special car to the factory at Flint, Mich.

Iowa City, In .- Joseph O'Leary has leased the ground floor of two new buildings on the corner of Dubuque and Burlington streets, in which he will conduct a garage.

Winfield, Kan .- A garage is to be erected on the lots on Tenth street facing the Odd Fellows building. Roy Nunn has taken a lease of the premises.

New Orleans, La .- A. Aschaffenberg will commence the erection of a garage

and salesroom on St. Charles street the first of January. L. H. Fairchild is planning for another garage on the same street.

New Orleans, La.-Emilien Perrin will erect a two story, gox too foot fireproof garage and salesroom on Dryades and Lafayette streets, to cost \$25,000. A lease has been taken of the premises by the Crescent City Automobile Company until September 30, 1915.

New Bedford, Mass .- James Holsted has opened a garage at 244 Purchase street and will combine a repair shop with it.

Grand Rapids, Mich .- George Bandfield and James M. Webster will open a

Kansas City, Mo .- The Economy Sales Company, composed of H, M. Brooks and James G. White, have located at 1424 Mc-Gee street, to handle the Economy car, manufactured at Joliet, Ill. The company controls the sales of this car in forty counties in Missouri and Kansas.

Kansas City, Mo .- The Park Board of Kansas City has adopted a resolution to the effect that hereafter the board will oppose the building of garages upon boulevards where the approaches to them must be from boulevards.

Fremont, Neb .- The Cuddeback Automobile Garage has been taken over by the First National Bank to satisfy claims. Lee Beatty, who was foreman of the repair shop, has been placed in charge of the garage.

Rochester, N. H .- George W. Shaw has purchased the Wilson garage in this city.

New York, N. Y .- Henry Buttman will build a five story 50x85 foot garage on 167th street, west of Amsterdam avenue, to cost \$65,000.

Poughkeepsie, N. Y .- The Ryder Garage Company have purchased the building at 42 Market street and will remodel it into a garage. In the rear of the present building will be erected a brick and cement building 200 feet long, part of which will be two stories high. The second story will be devoted to repairs exclusively.

Rochester, N. Y .- J. V. Locklin will open a garage on State street, opposite Burgess Hall, in January.

Syracuse, N. Y .- The Auto Sales Company of Syracuse have purchased the automobile business and show room of the Empire Motor Car Company at 244 West Genesee street. C. H. Otis, formerly with the Genesee Motor Car Company, has been made manager of the Auto Sales Company, who will handle the Regal car,

White Plains, N. Y .- Paul & Almy, who have conducted the City Garage on Martine avenue since it was opened, have purchased the property for \$24,000. An extension of 50 feet, used as a machine shop, was recently completed.

Williamsbridge, N.Y .- Baisley & Watson will erect a two story garage on Williamsbridge road, north of Poplar street, to cost \$40,000.

Columbus, Ohio .- Fred Wood and Andrew Auble, two well known automobile men of Akron, have purchased the business of E. Shriber Reese at 2108 Euclid avenue, Cleveland, which has been conducted under the name of the Reese Motor Car Company. In the purchase they secured the agency for the Royal and Cor-

Portland, Ore .- The Regal agent, Karl McCroskey, has moved to Fifteenth and Burnside streets, and occupies a portion of the garage of the Graham Motor Car Company.

Portland, Ore .- The Willamette Auto Supply Company has been established, The new firm will have the local agency for the McIntyre car. B. R. Gunther and W. B. Neff, the latter Northwest manager for the McIntyre, compose the firm. A definite location has not yet been decided upon.

Portland, Ore.-The Packard Automobile Company will build a large garage at once on Twenty-third street, near Washington, on the lot recently purchased by the Realty Associates. The structure will be a two story brick, with reinforced concrete floor, for both garage and salesroom. It will cost \$29,000. Frank C. Riggs is the local agent of the Packard Company.

Philadelphia, Pa .- The Wayne Davis Company, representatives for the Everitt "30" and the Matheson, have purchased the property at the northwest corner of Broad and Race streets, from which the Matheson is handled.

Philadelphia, Pa.-The Palmer & Singer Distributing Company will move into a new fireproof building at 36 North Broad street at the beginning of the new year,

Philadelphia, Pa,-Harry L. McCullough has taken the agency for the Speedwell and the Parry cars, and has opened a sales room at 1416 Vine street.

Reading, Pa .- Henry M. Kurtz, of 440 Olney street, is erecting a two story concrete garage in the rear of his home.

San Antonio, Tex .- Frank Blackburn, of Fort Scott, Kan., and F. A. Hornaday, of this city, have organized the Texas Auto Company, and are building a garage, which will be completed shortly after New Year's. They will handle the Packard gasoline and Woods electric cars. Mr. Blackburn will have charge of the garage.

West Derby, Vt .- E. A. Aubin, formerly of Nashua, N. H., will open a garage and repair shop to be known as the West Derby Garage.

Norfolk, Va .- The Seaboard Auto Company have remodeled a former laundry on Tenth and Granby streets into a garage, and in the rear of same they will erect a two story repair shop. The company expect to occupy their new quarters January I.

Charleston, W. Va .- A garage to be known as the Triple State Garage will be erected on Kanawha street, near the bridge. Lawrence F. Beller will be manager.

Milwaukee, Wis .- The Studebaker Automobile Company are endeavoring to secure a site for a garage and salesroom. They are now temporarily located with the Sanger Automobile Company on Farwell avenue.

Superior, Wis .- The Ross Motor Car Company, agents for the Studebaker lines, has established a repair shop, which is one of the largest in the Northwest. The shop is one of the first in this territory to care exclusively for motor car repairs. H. M. Brown, of Chicago has been engaged to take charge of the repair department.

Lavalette & Co., makers of the Eisemann magneto, have brought out a new type specially designed for aeronautic work. Part of the instrument is made of aluminum, and the heaviest model weighs only 161/2 pounds, while the lightest of the four cylinder type weighs but 11 pounds. Five styles of these magnetos are made.

#### To Handle O. M. S. Parts.

The Q. M. S. Company (Quincy, Man chester, Sargent) announce that the Motor Parts Company will hereafter handle their automobile specialties. W. D. Sargent à president, F. F. Kister secretary and treaurer and C. H. Holbrook sales manager of the new company. The general offices of the Motor Parts Company are located at Plainfield, N. J., from which point the territory east of Detroit will be covered in the West their automobile step business will be taken care of by John C. Hoof, with offices in the First National Bank Building, Chicago. On their Auto Cle wench business, as in the past, the Factory Sales Corporation, 1438 Michigan avenue, Chicago, will act as distributing agents for the Western territory, and the Frank Mosberg Company, Attleboro, Mass., for the Eastern territory.

#### Good Year in Indianapolis.

Automobile dealers of Indianapolis report that sales this year have been much in cacess of those of 1908. It is estimated that the sales during the 1909 season amounted to between 3,500 and 4,000 cars. This large number is accounted for by the fact that almost all Indianapolis agents are distrilators for the greater part or all of the State Advance sales of 1910 models have been satisfactory, several dealers having disposed of from 30 to 50 per cent. of their 1918 allotments.

### Requa-Gibson Company Formed.

The Requa-Gibson Company has been organized under the laws of the State of New York, and has taken over the internal combustion engine patents of Hugo C Gibson, which were formerly controlled by the Requa-Coles Company.

PROMINENT DEALERS AT DINNER FOLLOWING ORGANIZATION OF METZGER MOTOR CALL COMPANY'S SALES DEPARTMENT IN DETROIT RECENTLY.

### NOTES OF THE INDUSTRY AND THE SPORT.

#### Miscellaneous Notes.

Some tests made by J. D. Maxwell, of the Maxwell-Briscoe Motor Company, are said to have shown that cactus fibre is an excellent brake lining material.

The New Process Rawhide Company, Syracuse, N. Y., have purchased a half acre tract adjoining their plant on Plum street, to be used for further factory extensions.

The New York School of Automobile Engineers, 146 West Fifty-sixth street, New York city, have decided to give a free lecture once a month throughout the winter.

The city clerk of Salina, Kan., has so far issued eighty-one automobile license tags at \$2 each, under the recently adopted ordinance, and also thirteen duplicate tags for garages at \$1 each.

The Overland Automobile Company have placed a contract for brass and steel parts for their automobile engines with the Morrow Ball Bearing Drill Chuck Company, La France street, Elmira, N. Y.

It is reported that the Shawmut Motor Company have obtained an option on a factory property in South Boston, and will begin operations the first of the year if they secure sufficient financial support.

The Auto-Axle Company, of Fort Wayne, Ind., are remodeling the old windmill factory and installing machinery for the manufacture of automobile axles. They expect to begin operations by January 15.

The Croxton-Keeton Motor Company, of Massillon, Ohio, will erect an 880x144 foot addition to their plant on Walnut and Canal streets. Work will begin at once, and the building will be completed early in the spring.

C. C. Tuxbury, of Grand Rapids, Mich., has had plans prepared for the construction of a one story, 65x150 foot building on Fulton and Market streets, to be used for the manufacture of automobile engines and auto parts.

The Swinehart Clincher Tire and Rubber Company, of Akron, Ohio, who formerly manufactured only solid tires, have begun the manufacture of pneumatics, and expect to turn out 100 tires per day in January and February.

The Simms Magneto Company have opened large premises at 1780-82 Broadway, New York, for distributing, assembling, repairing and fitting their magnetos. Frederick R. Simms, of the parent company in London, is at present in this country directing the establishment of the new quarters

The Hendee Manufacturing Company, of Springfield, Mass., manufacturers of the Indian motorcycle, have opened a branch in London, England. This step was preceded by a season's participation in foreign motorcycle events. An Indian motorcycle fit-

ted with Simms magneto recently broke several world's records on the Brooklands track.

The Worth Automobile Company, of Kankakee, Ill., are remodeling the old horse nail factory preparatory to occupying it as an automobile factory the first of the year.

Thos. B. Jeffery & Co., of Kenosha, Wis., makers of the Rambler, will build a large new office building next spring. Plans have already been accepted and work will begin as soon as the frost is out of the ground.

At the coming Grand Central Palace Show 12,000 square feet of floor space will be occupied by the members of the Importers' Automobile Salon, an organization which was first formed several years ago to hold a separate show for foreign cars.

The management of the automobile show to be held in Portland in January have decided not to allow curb brokers' entries, and to this end a regulation was made that no dealer who had not been located in Portland sixty days prior to the show will be permitted to buy floor space.

The Lovell-McConnell Manufacturing Company, Newark, N. J., manufacturers of Klaxon horns and other automobile accessories, have purchased a building site on White and Emmet streets, on which they are erecting a machine shop, a foundry, a power plant, a storage building and a garage.

The recently organized Abbott Motor Company, of Detroit, are erecting a factory at Waterloo and Beaufait streets, on the Belt line, to cost about \$125,000. The buildings are to be of brick, concrete and frame, two stories high, and when completed will cover the entire site, which measures 600x155 feet.

The Cadillac Motor Car Company, of Detroit, Mich., sent a shipment of twenty-one of their Cadillac Thirties, valued at \$33,600, by the steamer Makura, which left Vancouver, B. C., on December 14, to Australia. This is probably one of the largest single foreign shipments of American cars that has ever been made.

It is reported that the Racine-Sattley Company, of Racine, Wis., with branches in several other Western cities, will soon engage in the manufacture of automobiles. David Connolly, a motor car designer of Pontiac, Mich., has been engaged by the company, which seems to confirm the rumors.

The Weyher Machine Company, of Whitewater, Wis., has produced the first model of a one-half ton automobile truck equipped with an 18 horse power engine. Trials in wintry weather have been successful, and the company proposes to increase its production at once. The company has orders for several trucks, contingent upon

the success of its first product. The wheels are larger than the usual equipment of automobile trucks.

C. A. Metzger & Co., of New York city, have bought the factory of the Newark Rivet Works, Newark, N. J., in which the Friction wind shield, recently described in our columns, has been manufactured. The factory will be used for the wind shield branch of the Metzger Company's business.

The Bailey Oil Company is being organized at Toledo, Ohio, by F. A. Barker, of the Willys-Overland Company, and F. T. Bailey, formerly of the A. W. Harris Oil Company. The company will bring out a line of lubricants particularly adapted to Overland cars, and later will enter the field with a line for general use.

According to figures compiled from the registration records of the Secretary of State of Illinois, the Buick led among the registrations for November with 41 cars, followed by Ford, with 37; Packard, 32; Maxwell, 24; Studebaker, 21; Woods, 20; Winton, 18; Cadillac, 18; Chalmers-Detroit, 15; Peerless, 12; Reo, 12; Rambler, 11, etc.

The Racine Foundry Company has been incorporated at Racine, Wis., with a capital stock of \$40,000 to produce casting especially for the automobile trade. H. R. Birdsall, Henry Graham, W. C. Palmer and others are backing the concern. The Progressive Foundry Company is another new Racine concern that will produce castings for this trade. The capital stock is \$10,000, and the incorporators are W. J. Kostermann, Dora Kostermann and Mary E. Geb.

#### Club Notes.

The Philadelphia A. C. now has a membership of 1,014, having elected forty-one new members at its last election.

The Louisville (Ky.) A. C. is championing the proposed Newcomb bill, to be introduced in the Kentucky Legislature during the next session, which imposes heavy penalties on joy riding.

A joint meeting of the Commonwealth and Massachusetts motorcycle clubs of Boston was held on December 16, for the purpose of organizing a new motorcycle association, which will probably be known as the Boston Motorcycle Club.

At a meeting of the Mobile (Ala.) A. C., in its clubrooms at 405 City Bank Building, on December 8, it was decided to get into communication with motorists in all parts of the State, with the object of forming a State association to join the A. A. A.

The Delaware A. A. has issued its year book for 1910, which contains a list of the officers and the members of the association, the constitution and bylaws and the advantages of membership in the association and the A. A. A.; a digest of the State laws

relating to automobiling and descriptions of a large number of automobile routes in the East.

The winter endurance contest of the A. C. of Worcester, Mass., which was to be held on Friday, December 17, had to be abandoned on account of lack of entries.

The following nominations have been made for officers of the Denver Motor Club for 1910: William D. Nash, president; N. J. Vroom, vice president; C. P. Allen, treasurer, and G. L. Wands, secretary.

Officials of the A. C. of St. Louis have requested the police department to stop the malicious strewing of tacks on the streets, which is said to have caused tire troubles to a great many motorists during the past several weeks.

The executive committee of the Louisville (Ky.) A. C. has secured two rooms in the Commercial Building at Fourth avenue and Main street for office purposes. One of the rooms will be the members' room and the other a private office for the assistant secretary.

At a recent meeting of the Columbus, Ohio, A. C. nineteen applications for membership were favorably acted on. This is the first of the large number of new members anticipated during the winter from the campaign for new members which was started recently. The club now has about 400 members.

The Chicago A. C. will hold an annual century run over the Elgin-Aurora course on January 1, starting from the clubhouse in Chicago at midnight. A supper and dance at the Fox River Country Club will be one of the features of the run. The arrangements are in charge of the runs and tours committee, of which B. B. Ayers is chairman.

The A. C. of New Rochelle, N. Y., at its recent annual meeting elected the following officers: W. B. Ogden, Jr., president; Edmund Eckart, first vice president; G. W. Bennett, second vice president; F. D. Le Count, treasurer, and F. M. Carpenter, secretary. A sum of \$4,000 was subscribed for to make a first payment on the new \$25,000 clubhouse.

The A. C. of Pittsburg, Pa., has had the distance from Seventh avenue and Grant boulevard to Craig street measured. It is slightly less than 2½ miles, and, allowing for sharp curves and slow-downs at Washington and Thirty-second streets, this distance cannot be covered in less than seven minutes without violating the law. It is between these two points that most arrests for speeding are made.

The A. C. of Newburgh, N. Y., held its annual meeting at the Palatine Hotel on December 15. Fifteen new members were elected. The following officers were elected: Walter H. Whitehill, president; Chas. E. Stafford, vice president; Geo. S. Weller, secretary, and Geo. R. Mitchell, treasurer. After the business meeting a luncheon was served, at the conclusion of which a number of addresses were made. Bert Van Tuyle, secretary of the New York Stafe

A. A., was present and spoke to the members of the club on the bills which will be introduced in the Legislature at Albany this winter, on the evil of speed traps, etc.

The San Francisco Motor Club held its annual meeting on December 10 and elected the following officers: Henry M. Owens, president; H. L. Owesney, vice president; C. S. Richardson, second vice president; W. R. Johnston, secretary, and C. E. Starret, treasurer. During the past year the club compiled a tour book which was distributed among the members. According to the report of Treasurer Starret the club had a treasury balance of \$93 on December 1, with no debts.

### New Incorporations.

The Fort Wayne Auto Axle Company, Fort Wayne, Ind.—Capital stock, \$100,000.

The Muskegon Motor Car Company, Muskegon, Mich.—Capital stock increased from \$20,000 to \$30,000.

The Brown Auto Carriage Company, Cleveland, Ohio.—Capital stock increased from \$15,000 to \$50,000.

The Jonz Auto Company, Beatrice, Neb.
—Capital stock, \$100,000. Incorporators, C.
Chas. Jones and others.

The Keating Garage and Engine Company, Oswego, N. Y.—Capital stock increased from \$10,000 to \$20,000.

Dan Canary Taxicab Company, Chicago, Ill.—Capital stock, \$15,000. Incorporators, A. R. Hurlbert, F. J. Haake and Sidney S. Gorham.

The Neches Motor Car Company, Beaumont, Tex.—Capital stock, \$10,000. Incorporators, W. C. Gray, Walter Leight and Geo. H. Leight.

The Cutting Motor Company, Manhattan, N. Y.—Capital stock, \$10,000. Incorporators, H. P. Jones, H. Rosenberg and H. M. Browne.

The McAdoo Garage Company, Greensboro, N. C.—Capital stock, \$10,000. Incorporators, William D. McAdoo, C. M. Lea and J. M. Rosenblatt.

Belgrade Automobile and Garage Company, Belgrade, Me.—Capital stock, \$10,000. Incorporators, Chas. A. Hall, Harold F. Travis and others.

The Bayless Motor Car Company, Louisville, Ky.—Capital stock, \$6,500. Incorporators, W. K. Bayless, T. C. Bayless, E. B. Bayless and E. B. Chenault.

The White Star Taxicab and Garage Company, Chicago, Ill.—Capital stock, \$50,000. Incorporators, Harry J. Guttman, W. J. Stewart Hyde and E. D. Fritch.

The Johnson Motor Car Company, Dover, Del.—Capital stock, \$100,000. Incorporators, James H. Johnson, of Philadelphia, and Edwin R. Cochran, of Wilmington, Del.

The Southern Automobile Company, Spartanburg, N. C.—Capital stock, \$10,000. Incorporators, A. B. Calvert, Dr. Webb Thomson, A. L. Crutchfield and John B. Cannon.

The Rae Electrical Vehicle Company, a Delaware corporation with headquarters in

Boston, has increased its capital stock from \$250,000 to \$20,000,000, and has changed its name to the Rae Electrical Equipment Company.

The Kauffman Vehicle Manufacturing Company, Miamisburg, Ohio.—Capital stock, \$100,000. Incorporators, T. J. Kauffman, H. B. Lyons, D. H. Allen, Jacob Klee and George Behlen.

The Johnstown Motor Car Company, Johnstown, N. Y.—Capital stock, \$15,000. Incorporators, Fred L. Carroll, Chas. A. Miller, Godfrey Hillabrandt, Henry Veghte, D. A. Hays, E. Lucas and J. D. Pierson.

### Trade Personals.

William Hyslop, of Toronto, Ont., well known in automobile circles and the leading dealer in that city, arrived in New York from Paris on Tuesday.

J. M. Hill has resigned his position with the Alden Sampson Manufacturing Company, of Pittsfield, Mass., the resignation having taken effect on December 13.

W. A. Schuler, formerly with the Nieuport Magneto Company, of Paris, has joined the Simms Magneto Company as manager of the New York branch.

D. D. Cummins, until recently connected with the Mankato Auto Company, has accepted a position as sales manager of the Four Traction Auto Company, of Mankato.

S. H. Pierce has been appointed manager of the Denver Ajax tire agency. Mr. Pierce some years ago was salesman in the Chicago Ajax branch, and later had charge of the Minneapolis branch.

Jesse Froehlich, of the Times Square Automobile Company, of New York, has just returned from a trip abroad, and reports that he secured the American agency for the Goggenau trucks, built by the South German Automobile Works, in Goggenau, Baden.

Courtland D. Cramp, of the William Cramp & Sons Company, and Minor Harvey, Jr., of the Morse Williams Company. Philadelphia, were in New York early this week in the interests of their respective companies. Both reported a flattering outlook for 1910.

Charles M. Hall, of the Hall Lamp Company, Detroit, Mich., has been elected a director of the Motor and Accessory Manufacturers, to fill out the unexpired term of H. S. White, formerly of the National Tube Company, of Pittsburg.

E. F. Herst, formerly with the Warner Gear Company, of Muncie, Ind., and later with the Chalmers-Detroit Motor Company, has been appointed superintendent of the transmission gear department of the Brown-Lipe Gear Company, Syracuse. N. Y.

C. W. Moody, formerly manager of the Pennsylvania Rubber Company's Chicago branch, has accepted the position of general sales manager of the Swinehart Tire and Rubber Company, Akron, Ohio. Mr. Moody has been in the tire business for the past five years in Cleveland and Chicago.

### The Horseless Age

First Automobile Journal in the English Language

VOLUME XXIV

NEW YORK, DECEMBER 29, 1909

**NUMBER 26** 

### Tenth Annual International Automobile Show, Grand Central Palace, New York.

When the doors of the Grand Central Palace are thrown open on New Year's eve, Friday, December 31, Motordom will see the annual show season ushered in with the largest exposition ever held by the American Motor Car Manufacturers' Association. In this somewhat ancient structure, which seems to be composed largely of confusing

nooks and corners, this tenth annual show of the association will reveal between 300 and 325 exhibitors displaying a varied conglomeration of fine cars, large and small, accessories and other things pertaining to the automobile. In conjunction with the A. M. C. M. A., the Importers' Automobile Salon will display foreign cars, and the Motor and Accessory Manufacturers' Association, which includes the foremost makers of accessories and parts, products in these lines.

Of the number to be represented, eighty-four are exhibitors of complete cars, sixty-eight being pleasure vehicle makers exclusively and nineteen showing commercial cars, either alone or together with pleasure vehicles. Twelve of the eighty-four are foreign exhibits.

Of the pleasure types shown, prices to suit all sorts of pocketbooks will be met. From the little \$485 Brush runabout to the \$7,000 and up Fiat and Renault limousines there is a wide range of values, while the unique Metz plan car of small dimensions can be had for the small sum of \$378—and on instalments at that. The curious selling plan of this car is of interest in that the car is delivered piecemeal at so much per piece, the sections costing about \$25 each, and after buying all the parts on "easy payments" they can be as-

sembled and the car put on the road. Commercial vehicles range from a \$500 delivery cart to a 10 ton truck listed at \$6,500. The total value of the cars displayed is over \$1,000,000.

Among the accessory exhibits will be found about every sort of device on the market intended for the motorist and manufacturer of cars. In addition to those who now have floor space, fully fifty other concerns are now on the waiting list, hoping

for an opportunity to squeeze in somewhere. As it is, 72,000 square feet of floor area will be occupied, every inch of which was sold three months ago. This is an increase of 4,000 square feet over last year.

Forty of the complete vehicle exhibitors are members of the A. M. C. M. A., while in the accessory division ninety-five of those

Grand Central Palace Lexinoton Average DEC. 3157 to JAN. 750

SMALL POSTER OF THE SHOW.

expected to be present are members of the Motor and Accessories Association. The balance are unattached. It is true that several makers of cars which are now licensed under the Selden patent will show their products at this exposition, which has always been known as the "unlicensed" or "independent" show. This is the first time that this has occurred, although the reason is most simple. These companies, such as the Maxwell-Briscoe Motor Company, the

Dayton Motor Car Company and a few others, had taken space in the A. M. C. M. A. show some time before the recent decision of Judge Hough upholding the Selden patent. Upon this decision being handed down, these manufacturers applied for and were admitted to membership in the Association of Licensed Automobile Manufac-

turers upon payment of back royalties declared to be due the Licensed Association. This, however, by no means signified that they left the A. M. C. M. A., or that they were expected to. According to officers of the latter association, the impression that the A. M. C. M. A. was formed to fight the Selden patent is an erroneous one, and there is absolutely no reason why the manufacturers above mentioned should not exhibit at the Palace.

### SHOW COMMITTEE.

Those responsible for the greater or less success of the coming show are the members of the association's show committee, and, of course, Alfred Reeves, general manager of the A. M. C. M. A., and his corps of assistants. This show committee is composed of R. E. Olds, chairman; Benj. Briscoe, E. Rand Hollander, S. H. Mora, H. O. Smith and D. J. Post. The calibre of these men is so well known that no eulogy is necessary here. The publicity for the event is again in the hands of Leon Myron Bradley and Duncan Curry.

SHOW HISTORY.

A glance backward at the shows of the past held under the auspices of "the independents" reveals the fact that during the past four years they have been held in the same old Grand Central Palace, with an increase of exhibitors each successive year, while prior to that time the shows were

while prior to that time the shows were held in Madison Square Garden, where the Licensed Association has more recently held forth. The first automobile show ever held in America was under the joint auspices of the National Association of Automobile Manufacturers and the Automobile Club of America, at the Garden, with sixty-nine exhibitors. Nowadays, whenever we happen to see a car of the type shown that year we smile. Those

were the days of hot tube ignition, rear entrance tonneaus, with doors that would fly open and drop passengers, and other historic features. In 1901 the club and the Manufacturers' Association in the same building increased their number of exhibitors to ninety-two, a material increase that held out great hopes for the future. No show was held in 1902, but in 1903 the number showing at the Garden under N. A. A. M.-A. C. A. auspices was more than doubled-198. In 1904 there were 205; in 1905, 247. At the time of the 1905 show the Association of Licensed Automobile Manufacturers secured a lease of the Madison Square Garden for automobile show purposes for a number of years, and this resulted in the holding of two simultaneous shows in this city during January, 1906, one by the Licensed Association in Madison Square Garden, and the other by the Automobile Club of America in the adjoining Sixty-ninth Regiment Armory. Since that time there have been two shows in this city every season, a "licensed" and an "unlicensed" one. The next unlicensed show was held under the joint auspices of the A. C. A. and the A. M. C. M. A. in the Grand Central Palace late the same year, 1906. Neither of the two unlicensed shows of 1906 compared with the single show of 1905 in respect to number of exhibitors, only 218 displaying at each. Nineteen hundred and seven, the panic year, saw the first early fall show, held in October, with 257 concerns displaying, while the last show, held December 31, 1908-January 7, 1909, eclipsed those of former years, with 286 exhibitors. This was the first time the show was held without the co-operation of

the Automobile Club. This season, with upward of 300 on the list, a new record is being established.

NEW YEAR'S EVE OPENING.

The selection of New Year's eve as an opening date, which is rather odd, was tried last winter, and it proved most successful in spite of the fact that it was claimed by some that people would not care to visit an automobile show on such a great date in the metropolis. The fact that so many attended and paid admission that opening night proved how interested New Yorkers and others are in motor cars. Inasmuch as so many excursions to New York from all parts of the country are run around the first of the year, the date proves a convenient one for dealers and others in many cities. After attending the opening they can go out and celebrate with the rest of New York.

Invitations have been extended to more than 5,200 dealers and manufacturers throughout the United States; also a number in Mexico and Canada, and in addition to these 3,500 carriage builders have been asked to attend. Special invitations have been sent to Mayor McClellan, who retires from office the night the show opens; Mayor-elect William J. Gaynor, and numerous other city officials and celebrities.

DECORATIONS.

No expense has been spared to make the interior of the Palace attractive, and to provide an artistic setting for the cars. The show committee has æsthetic tastes, and believes in the theory that "fine feathers make fine hats." Anyway, the committee promises the most beautiful decorative scheme ever seen in that building, although it is not

intended to have the "art" outshine the beauty of the cars themselves. The general scheme executed by Messra. Unitt and Wickes is a trellis, or gigantic arter, the designers hoping to have the cars on the main floor appear as though parked in a beautiful fairyland garden. Cresping wand entwining the trellis will be verdan vines, also flowers and cages with singing birds, while about the pillars and posspotted palms will hover.

As a number of the cars will be of to eign manufacture an effort has been make to make a portion of the decorations are national in character, and, according to the show press agent, "Italy, Franch and Gemany have been searched for cunning little floral novelties that are in a way symbolic of the countries the cars represent."

Aside from the trellis garden idea, the effect involves a lattice and landscape aspect, while thousands of electric light bulbs and chandeliers will give ample itlumination for the brilliant automobiles. The color scheme is Nile green on the lattice work, with a soft Caen stone tackground, while through the grapevine hung roof blue sky will be faintly seen. The spectacular feature of the decorations will be the huge electrical marble fountain at the end of the main aisle, where last years statuesque group stood. The fountain is about 16 feet long and 14 feet high, and in back of it will be a huge mirror. It will have mechanical color effects, produced by a rotary pump and a combination of colored mirrors electrically operated. The perte cochère of the Palace will be elaborately decorated and illumined; also surmounted with the reproduction of the familiar picture of "Miss Liberty at the Wheel," done in electric lights.

The signs on the main floor and two upper galleries proclaiming the names of the exhibitors and their products will be in raised gilt Egyptian letters on a green background. In the court beneath the trellis on the main floor, however, there will be standards on posts with illuminated alabaser signs.

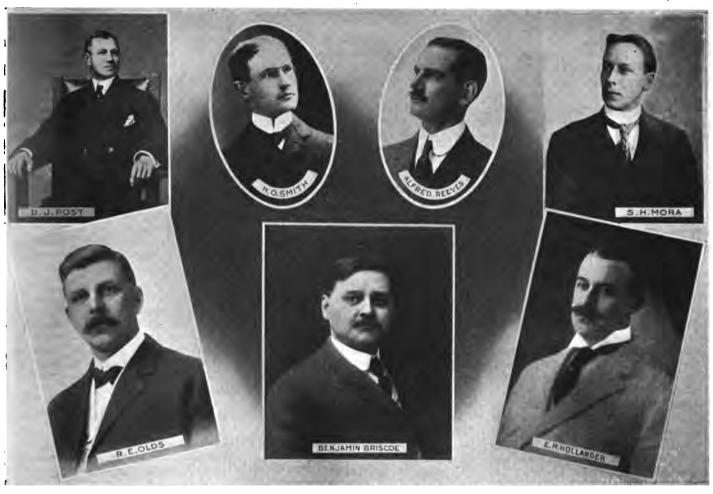

### SPECIAL NIGHTS.

As usual, the week will be made up of special nights, upon which various classes of people will attend. There will also be plenty of luncheons, dinners and meetings, the program for which is as follows: Friday, December 31, the usual private view of the show will be given to members of the Automobile Club of America, American Automobile Association, Long Island A C and city officials at 3 p. m. At 8 p. m. the formal opening to the public will useum.

Saturday, New Year's, the show will open at 9 a.m., and in the evening the Automobile Club will give a smoker to the exhibitors. This will also be "Army and Navy" night, and General Leonard A. Wood, commander of the Department of the East, and officers from Forts Schaylet. Wadsworth, Hamilton and Governor's Idand have been invited by the Army and

THE GRAND CENTRAL PALACE.

SHOW COMMITTEE OF THE AMERICAN MOTOR CAR MANUFACTURERS' ASSOCIATION.

Navy Club. Sunday will be observed as a day of rest, and visitors will have a good opportunity to see what the town looks like.

Monday, January 3, the New York Automobile Trade Association will hold its meeting at Hotel Manhattan at 12 noon. "Engineers' Night."

Tuesday, January 4, is "Society Day," with the admission fixed at \$1. This will be the only dollar day, the admission being 50 cents during the rest of the week. The Society of Automobile Engineers will hold its meeting at 10 a. m., and at 8 p. m. will hold its dinner at the Automobile Club of America.

Wednesday, January 5, the A. A. A. Good Roads Board will have a meeting, and at 6 p. m. the Motor and Accessory Manufacturers' annual meeting is scheduled, to be followed by a banquet at 7:30 at the Waldorf. The evening will be known as "Merchants' Night," and many prominent commercial men and merchants' associations will attend.

Thursday, January 6, at 3 p. m., will be the meeting of the committee of management of the A. M. C. M. A., and at 7 p. m. the dinner to dealers given by the Maxwell-Briscoe Motor Company at Hotel Manhattan. "New York Night."

Friday, January 7, there will take place at Hotel Manhattan the first annual meeting of the newly formed Manufacturers' Contest Association, which by that time will have taken charge of automobile contests in America. President Benj. Briscoe will preside.

### SOME ATTRACTIONS.

Of course, about every conceivable type of body on all sorts of chasses will be found in abundance at the Palace. The new "gunboat" bodies and "torpedo tonneaus" are expected in large numbers and in varied color schemes. A number of manufacturers who are more or less identified with racing will show racing stock cars and special speed machines, among them being the Fiat, Isotta, Renault, Lancia, Hotchkiss, Marmon, Chadwick, National, Stoddard-Dayton, Atlas, Maxwell and, perhaps, one or two others. It is expected that the chief racing attraction will be E. W. C. Arnold's famous 175 horse power Brooklands Fiat, with which Lewis Strang recently broke so many world's track records and American records at Atlanta, Ga., and Indianapolis, Ind. An examination of this high powered motor will prove most interesting to technical and lay men alike. The Renault which won a twenty-four hour race at Brighton last August, the Marmon Wheatley Hills Trophy winner and the Atlas Vanderbilt Cup car, that ingenious, musical, two cycle affair, will also be present.

No effort has been made to arrange the accessories, which occupy a good portion of the upper floors, into divisions. The Motor and Accessory Manufacturers' As-

sociation was allotted the bulk of the space, which they divided up among their members, who, of course, received preferred space. The unattached manufacturers got what was left. While a departmentization of accessories would be, no doubt, a desirable thing, such a condition is impossible, owing to the fact that many companies handle numerous lines of goods. Commercial vehicles have been centred as much as possible on the second floor.

### REDUCED FARES.

By an arrangement made by the A. A. A. with the Trunk Line Association it will be possible for many out of town visitors who are members of the Three As to make a trip to the show and home again at a reduced rate. A round trip can be procured from the territory mentioned below for one fare and three-fifths, and a large number will take advantage of the reduction. This holds good for all sections of New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, Virginia (points on the C. & O. and B. & O. roads), West Virginia, Ohio, Michigan (east of Lake Michigan), Indiana, Louisville, Ky., and St. Louis, Mo. Roads through Illinois will also make reductions for the numerous Chicagoans who will journey hither. The rate holds good between December 28 and Januarv II.

In commenting on the coming show, Alfred Reeves said a few days ago: "It has

been proven to manufacturers at the last two shows that the public has become educated as regards the motor car to a surprising degree. A dealer cannot stand in a booth nowadays and talk all sorts of foolishness about his car, arguing in circles, as he could a few years ago. Prospective purchasers and private owners who go to automobile shows now frequently know more about cars than the salesmen do. Where a manufacturer could expound the virtues of a certain form of construction to a prospective buyer a few seasons back, and convince the non-technical customer that it was something wonderful, when it was really poor, he cannot work that trick nowadays. Show the average private buyer something second rate at the show this year and he will turn around and tell you wherein it is lacking, and why. He has learned to judge a car in much the same manner that he would use his brains and common sense in judging a horse, picking thoroughbred instead of skate. It does a manufacturer no good in these days to tell all sorts of lies about his car, and make preposterous claims for what it will do, and it is pleasing to note that salesmen realize this. The motor loving public has 'gotten wise,' to use the classic phrase, and the men who sell cars at retail are the men who know their car and its construction well enough to give a prospective motorist a really intelligent argument. The interest that people are taking in automobile shows this year is remarkable. Not only will the A. M. C. M. A. show be the largest ever held, but the same holds true of all the larger shows all over the country-more exhibitors, bigger space, bigger attendance."

### IMPORTERS' SALON.

The Importers' Automobile Salon, in which nearly all of the foreign exhibitors are members, expects to make a splendid showing of handsome foreign cars, the bulk of which are high priced. At a meeting of the salon last week the various members when canvassed declared that all or most of their new models would arrive from Europe in time to be placed on exhibition, and the reports that the majority would be unable to show much of a line on account of delayed shipments seem unfounded. Some of these cars have come, or are coming, direct from the factories, and others from London, where they were exhibited at the Olympia Show. It is the intention of the importers to make their exhibit as comprehensive as possible, in view of the keen competition they are forced to fight in order to sell foreign cars in this country.

### COST OF SPACE.

That it costs exhibitors something to show their wares at these shows is evidenced by the fact that floor space on the main floor in the centre of the building sold at \$1.50 per square foot. The sides, back and front on this floor cost \$1.25 per square foot, and the first and second balconies \$1 and 75 cents, respectively. Signs and deco-

rations are furnished at 40 cents per foot of floor space.

In order that the show may present a pleasing and artistic aspect to visitors, the management will not permit the removal or receipt of goods in booths during the day with the exception of the hours 8 to 10 a, m. and 6 to 7 p. m. Another pleasing feature this year will be that no loud noises, such as the sounding of horns and sirens, or other devices which make unpleasant sounds, will be allowed. On account of fire department restrictions, no gasoline or other fuel will be allowed in tanks, and no acetylene lights will be permitted to burn. The latter will do away with much of the unpleasantness of bright lights flashing in people's eyes.

Those who expect to find radically new features in design will encounter disappointment. Charles E. Duryea, the association's technical expert, who has made numerous comparisons and gathered statistics of cars to be shown, says that the general tendency in design, save that of town cars, is toward longer wheel bases, lighter and shorter motors, wider doors and enclosed front seats. Magnetos are almost universal, while longer springs and larger wheels and tires will be noticed.

Some months ago, owing to the tremendous number of new manufacturers entering the field, with the announcement of about 200,000 cars for 1910, it looked as if there might be overproduction, and therefore a big drop in prices, but instead of a cut most of the makers of medium priced cars have raised the price of 1910 models anywhere from \$50 to \$250. Inability to secure enough parts from part makers and the increase in the price of tires and other material have made the raise necessary.

### Our Show Number.

The present issue is our first Grand Central Palace Show Number. It contains as special features a specification table, giving the specifications of all the different chassis types to be exhibited; photographs of one car of each make on exhibition; a collection of radiator outlines, which covers nearly every make, and a review of the parts exhibits.

In connection with the specification table, it may be pointed out that practically every make of runabout is furnished; also with either a single or double rumble seat, thus constituting a two, three or four passenger vehicle. Generally the three and four passenger cars sell at a slight increase in price over the two seated runabout. The table does not contain these alternative body models, as all the specifications outside the body and seating capacity are the same as for the two passenger car. It will be observed that the cars in the table are separated into gasoline pleasure, gasoline commercial and electric commercial cars, and in each division they are arranged in the order of price, which will be found particularly handy by intending purchasers.

The side views of cars include one of each make on exhibition, so far as we found it possible to insure completeness, and include mainly the leading and most recent types. The front views of radiators show that while the Mercedes form of outline is very prevalent, there is still considerable variety in radiator shapes.

An attempt has been made to classify the parts exhibits, but it is obviously impossible to carry this system of classification out completely, for the reason that some of the supply houses, for instance, exhibit a very large line, and would have to be enumerated under each head. For this reason supply dealers and jobbers carrying a line of considerable variety are classed by themselves. This method of classification under different heads will be found convenient to those looking for articles offered in particular lines. However, if they want to be sure to learn of everything in this line at the show, they will be obliged to read through the entire section on parts exhibits, as in some cases firms exhibiting two and three lines are classed under the heading covering their leading line, and their minor lines are mentioned at the same

### Milwaukee Dealers Boycott Show.

Representatives of twenty-five well known makes of automobiles in Milwaukee, Wis., have issued a public statement, announcing that they have mutually agreed not to display their cars in the second annual automobile and motor show of the Milwaukee Automobile Club, in the Auditorium, from February 22 to 27, inclusive.

"Believing the expense of exhibiting will be greater than the profits to be derived from the show," the announcement says, "we will not exhibit at this coming show." The agencies are:

Mitchell Automobile Company, Mitchell; Rambler Garage Company of Milwaukee, Rambler; Sanger Automobile Company. Oldsmobile, Maxwell, Stearns; Curtis Automobile Company, Reo; Jonas Automobile Company, Peerless and Cadillac; Welch Brothers Motor Car Company, Packard and Rauch & Lang electric; Akin Motor Car Company, Stevens-Duryea and Columbus electric; Emil Estberg, Pope-Hartford, Waverley and Woods electrics; Hickman, Lauson & Diener Company, Ford; Waite Brothers, Moline; Riverview Automobile Company, Moon; Bates-Odenbrett Auto Company, Overland, Marion, Winton; Albert Smith, Palmer & Singer; American Automobile Company, Pierce-Arrow, Apperson, Babcock electric

Each of the fourteen agnecies will conduct private shows in their respective garages. They claim unfair treatment from the Milwaukee Automobile Club, but the nature of this is not given out. President Clarke S. Drake, of the M. A. C., says that he is not aware of any unfair treatment, and while regretting the attitude of these dealers, believes the club will be able to get along without them.

### The Best Way to See an Automobile Show.

By H. H. Brown.

The question as to the best way to see an automobile show is a good deal like the often heard query regarding the best automobile; that is, there is no answer or there are a dozen, according to the viewpoint. In other words, it depends on what one wants to see and learn, as well as upon the time at one's disposal.

A good many ladies visit an automobile show chiefly to get a line on the different styles of dress, both for evening and automobile wear. To the ultra technical this seems somewhat frivolous, but as a matter of fact many dressmakers visit both automobile and horse shows simply with this object in view. Then, again, comfort in motoring, both in winter and summer, especially in the case of a woman, is quite largely dependent on suitable dress. Now that motoring has become an all the year round sport many people come by machine from quite long distances to visit the shows. As most of these are motorists of experience a less experienced person should easily be able to get many good ideas in styles by observing the visitors to the show. Perhaps the best time for this is late in the morning, as well as early in the afternoon. Of course for observing the styles in regular street and evening clothes the best time is the evening.

### HE NOVICE.

Perhaps the person most difficult to instruct how to see a show is the novice who has got his first touch of the fever. The chances are that he, if alone and unguided, will be in a sorry state of confusion when he leaves a show after his last visit thereto. The best thing for such a one to do is to get hold of some experienced and disinterested friend, state his case frankly, place himself in his friend's hands and ask him to serve as a guide.

It is, however, the motorists of experience to whom a show holds out the greatest interest, and this class may visit a show for a variety of reasons. They may wish to pick out a new car, to renew some article of equipment, such as horns, lamps, tires, ignition equipment, etc., on the old car, or perhaps simply to see with their own eyes the progress in the various branches of the industry and the general trend of design. There is also another possible object in attending a show which, while it may not be the leading motive, is yet worthy of mention.

Most of the leading manufacturers bring designers and factory men to a show, as well as their sales forces. Their object is to give them a chance to study various details of design in other makes of cars, as well as various features of equipment, which it may be desirable at some future time to incorporate in the design of their own car. Then, again, these practical men are often able to help out salesmen by talks

with customers on practical points which are beyond what can reasonably be expected of a salesman. Often the owner of a car has some little difficulty in its management which he has been unable to wholly overcome, and on which the local agent cannot enlighten him. In many cases a few minutes' conversation with the factory men enables him to overcome this difficulty in the future. The benefit from intercourse with technical men is by no means one sided. For some unknown reason defects in design will in many cases appear when a machine is placed in the hands of the general public which no amount of ingenious and studied abuse on the part of testers has been able to reveal. It often happens under these circumstances that some slight hint dropped by a user will put a designer on a line of thought which will eventually lead to the overcoming of the difficulty.

### MUST HAVE A PURPOSE.

In order to get the most out of a visit to the shows it is necessary to have some definite object in view. If one cannot think of any particular one the following suggestion may be of use: Start as soon as possible and think up some of the defects of design that have appeared in your car, or, if that is perfect, in the cars of your friends. Then in visiting the show, look to see what has been done to remedy these defects. It is probable that even if one does not follow out this course to a logical conclusion it may start one on a line of thought that will help one to better enjoy the show. Let us suppose that one has been troubled with water in the gasoline. This would lead one to look at strainers and separators on storage tanks and funnels, and also at filters placed between the tank and the carburetor, as well as at the design of carburetors themselves.

### TIRE NOVELTIES.

If there is one thing more than another that the average motorist is ignorant of it is tire manipulation. For this reason the kit of tire tools is usually inadequate and when the necessity arises for replacing a damaged inner tube, whether it be with a quick detachable or clincher rim, considerable difficulty is generally experienced.

This matter has been given considerable thought by both tire and accessory manufacturers, and each year brings out some new devices both in tools, appliances, tires and rims to mitigate the evil of the puncture fiend. There are probably few motorists who cannot profit by a little time spent in the examination of these appliances and their use. Examples might, of course, be multiplied indefinitely, but the two given will probably serve as well as any for an illustration.

Having now got our list of subjects in which we are interested, perhaps the next thing in order is to look over a list of exhibits and find the ones in which we are most likely to be interested. These lists are always published in the trade papers somewhat in advance of the principal shows. As a general thing the location of the exhibitors in the hall is also given, but in case it is not this can be obtained on the spot from the program issued by the show management. It is well, before visiting a show, to make some slight notes as to the exhibits that one especially wants to see, and also of any special features that one wants to look up.

### TOURS OF STUDY.

The more experienced a motorist is the more he can see for himself without the guidance of a salesman or exhibitor. For this class of show visitor the best time to see a show is what may be called the supper hours; that is, from about half past five to eight. During this time the small number of people in the building will give one easy access to most all of the exhibits. One can then look them over, make notes of any questions that he wants to ask, in case there are no persons in attendance at the particular exhibit capable of answering them, and later in the evening return and get information on the desired points. In case one is fortunate enough to be able to visit the show more than once, it is a good idea to collect as many catalogues as possible and read them over at home and look into the interesting points disclosed on the next visit. Various methods of carrying the catalogues collected can be resorted to. One that the author has found to be good is to wear a comparatively thin overcoat so as not to be inconvenienced by its warmth and to use the pockets of the same for receptacles, to contain the collection. Of course, if one has friends among the exhibitors this problem is then very simple, for as soon as the bulk of a collection becomes inconvenient for temporary transportation one can return to the friendly exhibitor's stand and deposit them in a safe place.

If one's time is limited it is much better to see the show by one's self than with a friend who has not seen it before.

Under these circumstances one can linger over the points at exhibits which interest him and pass over those which do not. If with a friend the chances of exactly the same points being of interest are rare, and one wastes time over what he is not interested in and perhaps hurries over what he really wants to see more thoroughly.

In the case of two friends of experience going to see a show together, a good plan is to so arrange matters that each of them sees a certain part of the show, then meet and briefly discuss what both have seen. Under these circumstances one is likely to see points which the other has overlooked.

RADIATOR OUTLINES.

### Parts Exhibits at Grand Central Palace.

### Tires and Tire Sundries.

The Diamond Rubber Company, of Akron, Ohio, will display a full line of Diamond wrapped tread tires, which will be classified into types and treads. The types include regular clincher, regular quick detachable, mechanical (Dunlop type and Fisk bolted on); the treads include regular round Bailey and Diamond grip (anti-skid). In the treads the Diamond grip is being specially featured for this season of the year. Another feature of special interest will be the new demountable rim. Besides the

DIAMOND STEERING WHEEL.

complete line of automobile tires there will be shown the Diamond motorcycle tire and the Diamond motor buggy special tire, made for high wheel automobile service, and the Diamond motor truck tire. The knives and tools used by the natives in gathering the raw rubber will be shown, together with the Kimball Trophy Cup, won by Diamond tires in the Reliability Contest of the Chicago Motor Club.

There will also be shown a number of hard rubber specialties, including the steering wheel illustrated herewith.

The Firestone Tire and Rubber Company, of Akron, Ohio, will show their regular line of pneumatic tires, including round tread and Firestone anti-skid, with extra thick tread for winter use, together with the Firestone demountable rim, for both pleasure and commercial vehicles. The demountable rim for pleasure cars will take any quick detachable tire or any standard clincher tire, though the stiff back quick detachable tires are the only ones recommended by the Firestone Company, as they remain in place on the rim, whether inflated or not. A new feature of this rim is a sleeve on the valve stem by means of which tires may be changed right on the wheel without reference to the demountable feature. The felloe band will take either a quick detachable or regular clincher rim, and the one may be substituted for the other if it is desired without altering the wheel. A new demountable, for both dual and single forms of the standard side wire truck tires for commercial use, will be shown. Another feature of the Firestone booth will be the dual pneumatic equipment, consisting of a pair of tires mounted on a demountable rim for rear wheel use.

The Goodyear Tire and Rubber Company. Akron, Ohio, will show as a special feature the Goodyear-Doolittle demountable, detachable rim, which has heretofore been marketed by the Doolittle Rim Company. This rim, as the name implies, is both detachable and demountable. The tire can be taken off the rim itself in practically the same time the rim can be demounted from the wheel. In connection with the above will be shown the regular line of tires, including detachable tires in plain, Bailey block and Heavy Tourist treads, and clincher tires in the same styles of treads; the Goodyear long distance electric tire, the hard rubber base motor truck tire, the motorcycle tire, the Goodyear universal rim, the Goodyear air bottle, with new reducing valve, which prevents overinflation of tires on which it is used, and a complete line of rubber tire sundries, including Protection patches, inside tire protectors, rim cut patches, inner tube patches, cements and raw stocks for repair men.

The Pennsylvania Rubber Company, of Jeannette, Pa., will show their line of regular type wrapped tread and flat tread clincher tires, non-skid tires with leather tread and case hardened rivets. A new tire, which will be shown for the first time, is the new Pennsylvania suction cup tread. This tread consists of a series of rubber cup shaped knobs on the tread of the tire. The hollow cups are claimed to create a suction, and to prevent slipping on wet or icy surfaces. Another novelty will be a pair of aeroplanes mounted complete on 20x4 inch wheels. The wide tires are used to withstand the shock of a thousand pound machine alighting. They are practically of no greater weight than 21/2 or 3 inch tires of 28 inch diameter.

The Leather Tire Goods Company, of Niagara Falls, N. Y., will have on exhibition their line of Woodworth treads, their new Woodworth tire chain, the Woodworth repair boots and the inside shoe patches. Two styles of treads are to be shown, the adjustable tread and the improved self adjusting tread. The adjustable tread has the crimped wires on each side, with the strap and buckle adjustment. The Improved Self Adjusting tread, which is a new design, is held on the tire by a chain work on each side composed of alternate coil springs and galvanized steel rings, which are riveted to the edge of the leather of the tread. The Woodworth tire chain differs from others in having strips of heavy leather under the cross chains to protect the tires.

The Gilbert Manufacturing Company, New Haven, Conn., will display a complete line of tire cases, spare tire brackets, carburetors, brass, leather and rubber specialties, principal among which will be the Gilbert tire case, made of black enameled duck, which has the edges bound with leatherette and fitted with extra large substantial snap buttons. With every case is furnished an extra bag which may be used for carrying a spare inner tube when the case is in use on the tire. A line of magneto covers, crank handle holders, steering knuckle end and universal joint boots made from leather will also be shown. Tire brackets made in all sizes will also be shown

The Federal Rubber Company, Milwaukee, Wis., will show a new anti-skid tire, which is known as "Federal's Cross Country Type." This is a most heavily constructed tire, and is recommended for heavy limousine cars and for winter usage. A mileage of 10,000 is claimed for this type, and it is considerably higher in price than other tires, owing to the fact that it has a specially treated, very tough tread. This same tread is used on the anti-skid tires as well as in the plain wrapped type.

American Stepney Spare Wheel Company, 1773 Broadway, New York, will have on exhibition their line of demountable rims and tires. These rims are applicable to either front or rear, and can be carried on the steps, requiring no more room than an extra tire casing; nor is it necessary to alter the automobile wheel in order to apply or to remove the injured tire. Demon-

STEPNEY BEING ATTACHED

strations will be given showing how to attach and detach the rims in case of trouble.

The Hartford Rubber Works Company, of Hartford, Conn., will show Hartford-Dunlop clincher and quick detachable clincher tires; Hartford wire grip, non-skid tires; Hartford aero tires and Hartford aero varnish. The Hartford clincher motorcycle tire and a double clincher tire with a special tread will be shown for the first time, and with the non-skid automobile tire will be especially featured. In connection with the above will be shown a full line of accessories, which include auto bumpers, horn bulbs, bow top separators, acetylene gas tubing, pumps, repair kits, shoe liners, Healacut cement, patches, Rough Rider grips for motorcycles and solid motor tires

for commercial vehicles. Also a crude rubber biscuit, washed rubber compound and the fabric which enters into the construction of the tires.

Morgan & Wright, Detroit, Mich., will display their full line of clincher, Dunlop and quick detachable clincher tires, side wire solid tires, hard rubber battery jars, motorcycle tires, auto sundries, etc. The feature of their exhibit this

MORGAN & WRIGHT RUBBER NON-SKID

year will be a new non-skid tire, which has been named the Nobby Tread. The tread has three rows of big, thick, tough rubber knobs set diagonally to the circumference of the tire, for the tread. This diagonal flanged principle is claimed to be new. The knobs bring a great length of diagonal projections into contact with the roadbed at one time. The broad surface of the knobs is claimed to give nearly as much wearing surface as the plain tread tire.

The Ajax-Grieb Rubber Company, Broadway and Fifty-seventh street, New York. will show their Ajax tires. Two features of the exhibit will be the new Ajax nonskid tire and the new motorcycle tire of the same non-skid type. In addition to these the smooth tread models for both clincher and demountable rims will be displayed. Both the automobile and motorcycle models have the same style of diamond shaped raised rubber studs, and differ in appearance from other anti-skid tires. The raised parts are three-sixteenths of an inch in depth, arranged diagonally across the tread and far enough apart to prevent squeezing and flattening into a smooth surface when under weight and in contact with the road surface.

James L. Gibney & Brother, 215 West Broad street, Philadelphia, Pa., will show a line of rubber goods and automobile accessories, together with the Gibney wireless tire for trucks and other vehicles, and the Auto Eleck-Trick vulcanizers. Gibney wireless tire is retained in position by a layer of hard rubber permanently united with the tire proper. This hard rubber portion is securely attached to a steel base portion, which fits over the steel felloe band. Between the steel tire base and the steel felloe band, in a compartment formed by relieving the centre of the steel base, is a thin cushion of soft rubber. The steel tire base is made to fit the felloe band very closely, and is held in place by lug bolts which run through the felloe band. The felloe band is shrunk on the wheel.

The Continental Caoutchouc Company, 1788 Broadway, New York, manufacturers

of the Continental tires and rims, will exhibit their various styles of tires, viz., round, heavy, flat tread, coarse and antiskid, steel studded. The Continental demountable rim will especially be featured, and a practical demonstration given of its application and removal. This is said to be the only demountable rim which is made a regular equipment by manufacturers of automobiles up to date. The coarse, flat tread tires are adaptable for heavy touring and limousine cars; the tread rubber is corrugated, giving abundance of road traction. The steel studded tires are made with the studs integral with the tire.

The Howard Demountable Rim Company, of 152 North Broad street, Trenton, N. J., will display a demountable rim. The rim is secured in place by the turning of one bolt, so that the tire and rim will always be brought to the same place on the wheel, as they can go on only one way. Any of the quick detachable or clincher rims can be used. One-half of the wheel is oneeighth inch under size, while the other half is the actual inside diameter of the rim that contains the tire, so that when the expansion device expands one-eighth inch it has clamped and drawn the rim true from the centre of the wheel, giving 120 square inches of friction at surface, which is claimed to be sufficient to pull 8 tons when the rim is tightened up.

The Michelin Tire Company, of Milltown, N. J., will have a large and interesting exhibit of their various products. An interesting feature of the booth will be a Michelin anti-skid tire mounted on a Michelin demountable rim, the wheel being fixed on a mahogany stand. The anti-skid tire has steel rivets on the tread, which are an integral part of the tire. The tread is made of leather instead of rubber. In this leather tread are imbedded from three to five rows of steel rivets. The demountable rim on which the anti-skid tire is mounted has but eight small nuts and clamps, which hold the demountable rim in place when it is desired to change tires. Another exhibit is the Michelin quick detachable rim complete, with side and locking rings. Michelin round and flat compressed tread tires, tubes, tools and Mastic and Michelin new valve spreader will also be displayed.

The exhibit of the B. F. Goodrich Company, Akron, Ohio, will consist of the Goodrich white tough tread tires, in quick detachable and regular clincher styles. A feature of the exhibit will be the Goodrich metal stud tire, for winter use on slippery and ice coated pavements, which was first introduced by the Goodrich Company last winter. The tire is of regular construction up to the point where the tread is applied. The tread of this non-skid tire is made of imported tough leather, in which metal studs are securely inserted. It is then securely vulcanized to the rubber portion of the tire. The Palmer-Webb tire for electrics will also be shown.

The Swinehart Clincher Tire and Rubber Company, of Akron, Ohio, will show their regular line of solid and cushion tires for motor buggies, automobiles, delivery cars and heavy trucks. In addition to the above will be shown for the first time a line of pneumatic, quick detachable and clincher tires of standard construction. A quick detachable rim for truck tires will be shown for the first time also. It is claimed that the heaviest motor truck tire can be applied in thirty minutes, anywhere, without any other tools than an ordinary wrench. The Swinehart twin tread bridge tires for electric pleasure automobiles are another novelty.

The New Jersey Car Spring and Rubber Company, of Jersey City, N. J., will show their "Carpringo" tires and inner tubes in all standard sizes, together with their line of automobile mats and matting. In addition to the round wrapped tread tire, they will show their new anti-skid, in which the leather tread and rubber carcass are vulcanized together by a new process, which, it is claimed, positively prevents separation.

The Empire Tire Company, of Trenton, N. J., will feature their new type checkered non-skid tread and new demountable rim in connection with their complete line of automobile and motorcycle tires and accessories. Their leaders will be demountable rims, brake liner and ignition cable, while the accessories will include V belting, pyramid matting, auto tube, motobestos packing, tire protectors and preservers, tire tools, patches and repair kits.

C. A. Shaler Company, Waupun, Wis, will display their line of electric tire vulcanizers operated by city current, with automatic heat control. These are shown in the following sizes: Type D, private owner's model, for alternating current, for repairing tubes and cuts in casings; Type B, public or private garage model, for direct and alternating current; Type C, public garage model for repairing blow-outs in casings. In connection with the above will be shown two distinctly new models, one specially designed

SHALER VULCANIZER.

for motorcycle tires, which is the same as Type C, except that it fits motorcycle tires. The other, Type E, or gang vulcanizer, is for vulcanizing from one to six inner tubes at a time, and is particularly adapted for use in garages.

The Fisk Rubber Company, of Chicopec Falls, Mass., will exhibit their complete line of Fisk tires and rims. The models include the "bolted on" type with removable rim feature, clincher, Dunlop and quick detach-

able clinchers. The former of these, "the tire that is bolted on," is being featured, owing to the dispatch with which it can be applied or removed. The advantage of having to loosen only five nuts, remove the punctured casing, replace a new one in from two to five minutes, and start off again, is said to appeal to many.

The Newmastic Tire Company, of Sixtyeighth street and Broadway, New York, will exhibit and demonstrate Newmastic, an elastic, resilient material, for replacing air in pneumatic tires. Newmastic is manufactured in the form of a liquid, the liquid state being only temporary, as the compound is so composed that it becomes an elastic solid substance a few minutes after it is inserted into the tire. Tires are filled with Newmastic in the same manner that they are inflated with air, the filling being injected through the valve under pressure, the air being released at the same time by hypodermic needles. A new adjustable rim for use in connection with Newmastic has recently been perfected, and can be seen by those interested.

The Borroughs Remountable Rim Company, 225 West Fifty-seventh street, New York, will exhibit the "Dorian" rim, formerly known as the "Borroughs." This rim is simple in operation, as each pair of wedges are tied together, and by loosening four nuts two sets of wedges are released, permitting the rim to be removed from the felloe. The wedges are held in place by eight bolts, having the buttress tread, which absolutely prevents their working loose. Two of these rims will be mounted on wheels and stands where a practical demonstration will be given of mounting and demounting.

The Calmon Pneumatic Tire Company, 1639 Broadway, New York, will show a full line of Calmon imported tires. These will be seen in regular round, flat and anti-skid treads, in clincher and quick detachable clincher styles. The anti-skid tire has a leather tread studded, with steel rivets, the leather being vulcanized to the regular round tread tires. The flat tread tires have a leather face tread similar to the anti-skid, but are not steel studded. The line also includes the Calmon inner tubes, Ajax brake lining and autobestos packing.

P. C. Traver Manufacturing Company, Far Rockaway, L. I., N. Y., will display the Traver non-skid device in parts. This device resembles the ordinary mud chain in its application, but instead of the chain it has case hardened steel plates, shaped to conform to the tire, with sharp studs where it comes in contact with the road. One of the features of this device is the piano wire springs at the sides, which preserve an even tension of the device on the tire and prevent chafing.

The Consolidated Rubber Tire Company, 20 Vesey street, New York, will display their full line of Kelly-Springfield molded pneumatic automobile tires, in regular

clincher and quick detachable clincher types, embracing round, flat and Bailey treads. Their line of solid vehicle tires will also be shown, and they will make a feature of their new Block tire for commercial vehicles.

Victor Tire Traction Company, Boston, Mass., will exhibit the Victor anti-skids. The cross members of these tire chains automatically turn on swivels, which is claimed to obviate wear on tires and to prolong the life of the chain. This anti-skid, it is claimed, can be put on the wheel tight, and is, therefore, noiseless.

The G & J Tire Company, of Indianapolis, Ind., will display a full line of automobile and motorcycle tires, as well as a line of motorcycle grips, lamp connections and equalizing chambers. In addition to this, they have tire tools, cement, acid cure solution and blowout patches.

The Brown Company, Syracuse, N. Y., will display the Brown tire inflation indi-

cator, an instrument for determining the exact air pressure inside the tire. The indicator is attached to the tire valve, the air being pumped through it, the gauge hand indicating the pressure at all times. A number of other specialties will also be shown.

The Batavia Rubber Company, Batavia, N. Y., who have recently entered upon the manufacture of automobile tires and tubes, will exhibit their complete line of round wrapped tires, together with their non-skid tires.

The Rutherford Rubber Company, Rutherford, N. J., will show their full line of tires and inner tubes, as well as sections of different size tires, showing the construction of fabric and rubber. This line is known as the Sterling tires and tubes.

Zeglen Tire Company, Chicago, Ill., will exhibit their automobile tire, which is composed of a special fabric, claimed to render it puncture proof.

### Ignition Appliances

Geiszler Brothers Storage Battery Company, of 514 West Fifty-seventh street, New York City, will display a complete line of Geiszler igniter batteries, lighting batteries, Geiszler Midget batteries, electric vehicle batteries and the Geiszler Albino. Geiszler Albino is a trouble searching lamp. and consists of a bent spring brass plate upon which a socket for a miniature electric lamp is mounted and fitted with a very fine cupped reflector. The flat back plate is slotted at each end and a loop of flat rubber elastic is attached to each end. In service a flat back plate fits smoothly against a man's forehead, and the elastic band going around the head holds the Albino lamp in position, much after the fashion of a miner's lamp. light double lamp cord extends from the lamp and can be attached to the storage battery or other battery used on the automobile, by which means a very bright light is produced.

The Osborn Electric Company, Detroit, Mich., will display their line of dash coils, marine coils and plain box coils, together with their new magneto. The features of the 1910 dash coil are: (1) The switch, which does not depend upon the cover (made of hard rubber) for contact; (2) the vibrator, which allows for the adjustment of each unit at the factory for a current consumption of 0.3 ampere and a standard frequency; (3) the manner of fastening the units into the dash case, which gives a positive connection instead of the slip unit contact for such connection; (4) instead of wires brass rods are used, which are in view and can be seen at any time should anything go wrong with the coil.

The High Frequency Ignition Coil Company, of Los Angeles, Cal., in addition to the well known Seeley ignition system, will show the Seeley duplex magneto, a low

tension alternating current magneto which retails for \$35. This magneto is claimed to develop sufficient energy at 40 r. p. m. to ignite any charge. It is suitable for use with the Seeley ignition system, with vibrator coils or with a make and break system. It has only one moving part, which runs in Hess-Bright ball bearings, and is guaranteed for five years. The winding is so designed that the peak spreads out at high speed over almost one-half the armature revolution, making it impossible to advance or retard the spark out of the peak. This instrument is claimed to be waterproof.

The United States Light and Heating Company, of 30 Church street, New York, will exhibit a complete line of sparking batteries, together with their new auto sparker and lighter, which is used for both lighting and ignition. The company have produced a new light battery for electric lighting. The exhibit will also include the CB and WB types of batteries, together with the newer CBH and WBH types of plates, which are a compromise in the matter of thickness. In addition to the above the CBT and WBT plates will be shown for the first time. These are thinner than either of the above mentioned plates. The new style hard rubber jar for vehicle work will also be shown.

The Lutz-Lockwood Manufacturing Company, Aldene, Union County, N. J., will display the S X magneto, together with the S X ignition dry cell. The S X magneto is what is commonly known as the semi-high tension type; in other words, the machine generates a low tension current which is increased in pressure in a transformer. By a novel arrangement of the "make and break" device the low tension current is distributed to the transformer in two separate circuits of pulsating current. The transformer is made of two separate

units, having four terminals, from which connections to the plugs are made. By this system of distribution two spark plugs are operated in series, thereby getting a spark in each cylinder at the end of the compression stroke and the end of the exhaust stroke.

The Splitdorf Laboratory, of 261 Walton avenue, New York city, will exhibit specimens of their full line of magnetos and gas engine ignition apparatus, as well as a complete set of apparatus for showing the

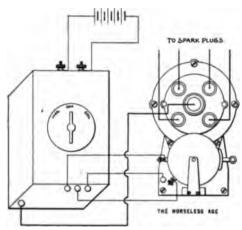

DIAGRAM OF SPLITDORF MAGNETO SYSTEM.

operation of each. One of the principal features of this display will be their new transformer. This obviates the necessity of carrying the high tension current to the dashboard for switching purposes, as was required with their regular transformer. This does away entirely with the large number of connecting wires.

The Auburn Mica Company, Auburn, N. Y., will exhibit the Auburn spark plug. This, as might be expected from the name of the company, is a mica insulated spark plug. The bolt shaped central terminal is exceptionally heavy, and is insulated with a

rolled mica tube composed of twenty-eight layers of pure sheet mica, which are claimed to withstand a pressure of 80,000 volts. This mica tube passes through a brass bushing, forming a gas tight joint. On both sides of the brass bushing the mica tube is surrounded with selected black mica washers, compressed under 2,000 pounds pressure, and claimed to be gas and oil proof. There is a large air chamber at the inner end of the plug, producing the well known self cleaning effect. The terminal of the outer electrode is made of platinum alloy, and the spark gap can be adjusted to any width.

The Witherbee Igniter Company, of Springfield, Mass., will exhibit their full line of batteries, spark plugs, timers, trouble lamps, ignition cable, etc. There will be seen two new articles, a new battery for lighting of 100 ampere hours, and the new Wico self contained igniter, containing some features not contained in other magnetos. This instrument generates an intermittent current, and does away with the condenser, breaker box and primary winding, with which other magnetos are equipped, simplifying the working of the machine. This igniter will generate as hot a spark on a quarter turn as it will when running at engine shaft speed; that is, the heat and voltage of the spark produced are independent of the motor speed, and, besides, a motor equipped with this igniter will start on compression by advancing and retarding the spark lever.

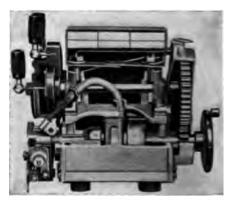

Atwater Kent Manufacturing Works, of Philadelphia, Pa., will exhibit their well known Atwater Kent spark generator and their new Unisparker. The Atwater Kent spark generator was the original single spark ignition device, and is used on a number of well known machines as a standard equipment. Only one spark is produced for each ignition, which results in great battery

THE HORSELESS ASE

SECTIONAL VIEW OF SPLITDORF MAGNETO.

economy. Dry batteries are commonly used with this device as the current source. The Unisparker is a smaller device of the same general type, which can be secured to any motor in place of the regular timer.

The Remy Electric Company, of Anderson, Ind., will exhibit a complete line of their magnetos. Two standard types of machines will be shown, Type T, for small powered motors of two or four cylinders, and Type S, for high powered motors of two, four or six cylinders. These magnetos are of the inductor type. and the range of spark timing has been increased one-third, while better facilities have been made for oiling, so that it is all done at one place at the top of the magneto. A cross section of the magneto will be shown, so that the position of the armature winding and the operation of the revolving inductors can be readily understood by the inexperienced The magneto is without revolving wires of any kind, doing away with all moving contacts and brushes. The stationary

SECTION OF REMY INDUCTION MAGNETO.

winding is direct connected through the magneto circuit breaker to a non-vibrating transformer coil carried in a neat, highly polished box on the dash. The coil is equipped with a two point switch for battery connection, which gives a dual system with one set of spark plugs, and a simple movement of the switch controls both systems.

The Union Battery Company, Belleville. N. J., are planning a very comprehensive display of their batteries, flashlights and ammeters. The flashlights will comprise many different shapes and sizes. The dry cells shown will vary from the small motorcycle cell up to 45 to 50 ampere cells for large gas engine use. The Union dry cell is put up in square cartons, which makes it convenient to pack in battery boxes and prevents the cells from shifting or turning. These cells can also be had in round cases if it is preferred.

Stanley & Patterson, 23 Murray street, New York, will exhibit their wireless battery holder. The holder resembles the ordinary battery box in outward appearance, the batteries being attached to the top by means of a thread by which they are screwed into place. The box is equipped

with lock and key, making it impossible for any one to tamper with its contents during the absence of the owner or driver, by substituting poor for good batteries, for instance. There are no connections to be made except those to the box itself.

Lavalette & Co., 112-114 West Forty-second street, New York, sole owner of the American patent on the Eisemann-Lavalette magneto, will show magnetos, with separate coils, and also the direct high tension type. A relatively new feature of these magnetos is the helicoidal pole pieces, which are claimed to prevent demagnetization, and also to allow of successful operation of the magneto at slow speeds. A novelty is to be found in the oscillating type of magneto, which gives practically an unlimited range of advance. The firm will also exhibit their new light magnetos for aeronautic purposes, in which all the possible parts are made of aluminum alloy.

In the display of the Bosch Magneto Company, 223 West Forty-sixth street, New York city, will be seen twenty-five typical examples of high tension magnetos for 1, 2, 3, 4, 6, 8 cylinder motors, together with five types of low tension magnetos with the magnetic plug ignition system for automobiles, and several of the low tension magnetos with magnetic plugs adapted for

BOSCH DUAL SYSTEM SWITCH.

automobiles, motor boats and stationary engines. Besides, magnetos for motorcycles with 1, 2, 4 cylinder motors will be shown. The Bosch dual ignition system will also be exhibited, and one new form of this system will be shown for the first time. The more important types will be shown on demonstration tables, and some of the magnetos will be run by electric motor to show the intensity of the spark.

Among the new things that will be shown by the Pittsfield Spark Coil Company, of Dalton, Mass., is a magneto for large stationary gas engine use. This magneto is somewhat larger than that made by the company for automobile work, and will give a 1 inch spark at a very low speed. A new dual system will also be shown with a coil contained in the magneto. Other things shown will include motorcycle magneto, coils, timers, switches, plugs, etc.

Herz & Co., Lafayette street, New York city, will show their well known line of tim-

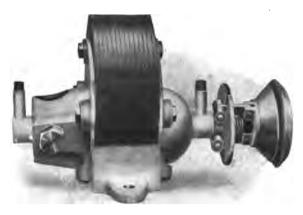

ers for automobile motors, from two cylinder to six cylinder; also the Herz distributor for any number of cylinders; ignition cables, French coils, imported storage batteries, French asbestos copper gaskets, Mercedes spark plugs, B & S air pumps, Moto whistles, Herz dust and water proof cover switches, Herz safety switches, wire terminals, Pater Noster shock absorbers and a complete line of ignition accessories.

The Motsinger Device Manufacturing Company, of Pendleton, Ind., will exhibit their low tension magneto, which can be

equipped either with a friction drive or geared to run in time with the motor cam shaft. This magneto can be easily applied to any engine, as it may be placed horizontally, vertically or at any angle around the flywheel, and can be driven from the front, back or outer surface (inside or outside of the rim). The friction wheel is made of compressed leather and is carried in a metal back. The pulley is easily removable for replacement. Lubrication is by the wick system.

The Westinghouse Companies, Boonton, N. J., newcomers in the ignition end of the industry, will exhibit three distinct lines, viz., electric motors, mercury rectifier charging outfits, and vehicle sparking batteries. These products were developed by the Westinghouse Machine Company. The storage batteries are made in both standard and high capacity types. The mercury rectifier charging outfit will be shown in operation.

J. S. Bretz Company, Times Building, New York city, sole importers of U. & H. magnetos, F. & S. bearings and Bowden wire, will display these goods in two all-

MOTSINGER LOW TENSION MAGNETO.

glass cases, 24 inches square and 24 inches high, mounted on heavy Mission tables. A ball bearing crank shaft which is used on the Stearns four cylinder car is also to be shown. The F. & S. annular ball bearings will be neatly mounted on a four sided birdseye maple pyramid in one of the cases, and ten U. & H. master magnetos, of different styles and sizes, on terraced platforms of birdseye maple, in another glass case. This permits of effective display of the samples, and protects them from dust and dirt and rude handling. The glass tops of the cases are, however, readily removed. The Bowden patented wire mechanism is used for the transmission of reciprocating motion in an indirect path around obstacles, etc., and is adapted for the operation of brakes, ignition and throttle controls, sprags and muffler cut-outs

Kokomo Electric Company, Kokomo, Ind., show a line of ignition specialties, including quadruple vibrator coils put up in nicely polished hardwood boxes for dash mounting, and the Kingston spark plug, which is made with three different threads as follows: one-half inch standard, seveneighth-eighteen A. L. A. M. and metric.

U. & H. MASTER MAGNETO, TYPE L. E. 4, SHOWING DISTRIBUTOR END DISASSEMBLED.

The Electric Storage Battery Company, Philadelphia, Pa., will exhibit their Exide battery for electric vehicles, together with their Exide sparking battery. It is claimed these batteries are long lived and of high capacity for their weight and bulk.

The New York Coil Company, of 338 Pearl street, New York city, will exhibit their line of coils running on battery current, low tension magnetos and mechanical interrupters, in connection with a full line of switches.

The National Carbon Company, Cleveland, Ohio, will show the Columbia multiple battery for ignition on internal combustion engines of any kind. The Columbia multiple battery is said to contain no acid, to be waterproof, to require no charging, and not to leak or spill.

Vesta Accumulator Company, Chicago, Ill., exhibit their Vesta sparking battery for the ignition of automobile engines. These batteries have been on the market for many years.

### Axles, Bearings, Springs, Frames.

The Timken Roller Bearing Company, of Canton, Ohio, will display three complete series of Timken roller bearings-long series, short series and annular replacement series. These bearings are adapted for use on front axles, rear axles, transmission shafts, jack shafts, pinion shafts, and in steering gears, knuckle heads, differential hubs, clutches, fan, etc., and will be shown complete in various sizes. The new series of Timken roller bearings are of the same dimensions as the most commonly used sizes of annular ball bearings, and can be used with little or no change in the place of annular ball bearings. In addition, a full line of pleasure cars and motor truck hubs

The International Engineering Company, of 1779 Broadway, New York city, will show a most complete line of R. B. F. radial and thrust bearings, together with Lemoine springs, axles, forging hubs, etc., and Lemoine mangano-silicon steel, especially adapted for gears. Several new lines of thrust bearings will be seen, principal among which will be those especially designed for automobile wheels to take the place of roller bearings. Another novel portion of the exhibit will be a line of bearings designed solely for magnetos. A duplicate of the apparatus used by Lemoine in testing steels will be on exhibition, and its operation ex-

TIMKEN 1910 PRESSED STREL REAR AXLE, WITH COVER REMOVED.

will be shown mounted on Timken roller bearings.

The Timken-Detroit Axle Company, of 168 Clark avenue, Detroit, Mich., exhibit will consist of a number of styles of I section front axles for pleasure cars complete with Timken adjustable roller bearings; three of the new type rear axles with pressed steel differential housing and roller bearings, and three commercial truck axles mounted on Timken bearings. The two larger sizes of front axles have Timken adjustable bearings in the steering knuckle. One of the strongest features of the rear axles is that the differential and bevel gears are removable as a unit through the rear by removing the housing cap.

The Perfection Spring Company, of Cleveland, Ohio, will exhibit a collection of flat leaf automobile springs of various types and models; also springs in parts, showing the construction, as well as mounted types to show the correct connection between frame and axle. The springs are all hand made from crucible, Krupp silicomanganese, or crucible chrome-vanadium steels.

The Standard Roller Bearing Company, annular ball bearings, ball thrust collar bearings, groove ball thrust bearings, etc.

of Philadelphia, Pa., will have no novelties this year, but show several different types of automobile axles and a large range of

R. I. V. BALL BEARING.

The exhibit of the R. I. V. Company, 1771 Broadway, New York city, will const chiefly of the R. I. V. radial bearing the distinguishing feature of which is its presed steel separator, which equally spaces the balls. The separator is stamped out to a radius slightly larger than the balls. This forms a hollow reservoir around the ball for the storage of oil or grease. The rings come in two sections, being held together by two special screws. Ball thrust collar hearings will be shown in divers shapes and sizes. In connection with the above will be shown for the first time the S. B. R. muifler cutout, which is easy to apply to any car. The valve is made to open against pressure of the exhaust in order to prevent leaks, and is applied by sawing out a pottion of the exhaust pipe on the bottom and clamping the cutout to it.

The exhibit of the American Ball Bearing Company, Cleveland, Ohio, will include tubular and I section front axles, complete with hubs and connecting rods, and will mclude several types and sizes of bevel drive rear axles complete. One of the novelbes will be a small pressed steel bevel drive rear axle of semi-floating type. This axle is fitted with "annular" ball bearings at the outer end. The axle shafts and drive shafts are made from vanadium steel. The spring seats are machined drop forgings. Several new types of I section front axles will also

### Metals, Forgings, Stampings, Castings.

Isaac G. Johnson & Co., Spuyten Duyvil, New York city, will show a wide range of steel castings, made by them, of various automobile parts. The steel used in these parts can be forged and welded. It can be case hardened and will bend freely when cold before breaking. The steel is easy to machine and finish, and resembles machinery steel in some respects. It is claimed that this metal is suitable for crank shafts, connecting rods, front and rear hubs, axles, spring hangers, foot brakes, radius rods, sprockets, gear cases, levers, etc. The tensile strength of this steel is claimed to be 80,000 to 85,000 pounds per square inch, and the elongation 15 to 18 per cent.

John A. Salman & Co., 17 Bromfield street, Boston, Mass., will exhibit a line of

automobile names and monograms, and monograms for all accessories pertaining w the automobile, manufactured in all metals. They will also show an exclusive line of monogram belt pins and buckles, as well as monogram watch fobs. Some of these are stampings, others castings,

Light Manufacturing & Foundry Company, of Pottstown, Pa., are specialsb in the manufacture of aluminum, marganese bronze and bearing metal castings especially adapted to automobic, autoboat and aeroplane work. Their antomobile brand of aluminum castings will be made the predominating feature of their exhibit, together with a metal they designate as Aerial brand aluminum castings, especially adapted for aerial work

This metal is slightly lighter than aluminum alloys used for general purposes.

The Vanadium Metals Company, of Pittsburg, Pa., will display a line of vanadium-aluminum crank cases, gear cases, pedals, etc., which are claimed to give double the strength of ordinary aluminum. Vanadium metals are adaptable for axles, levers, gears, crank shafts, casings, lamps, bearings, bushings and all parts liable to shock, vibration, unusual stresses and functional wearing. Victor vanadium bronze is claimed to have the physical properties of steels and anti-corrosive qualities peculiar to bronze compositions. Victor vanadium non-corrosive silver metal is adaptable for levers, lamps, trimmings and ornamental parts of all kinds. This silver metal never tarnishes, but always retains a very high silvery polish.

The Standard Metal Work Company, Thompsonville, Conn., will exhibit a wide variety of gas intake manifolds, water inhas fine brass wires intertwined in each strand, and designed to withstand the high temperature and pressure of gasoline motor work. It is claimed for Non-Burn brake lining, as the asbestos lining is known, that it cannot be charred or burned even by a blowtorch giving 2,000° Fahr. The manufacturers claim that No-Leak, when mixed with water and applied like putty to cylinders, pipes or radiators, metallizes and becomes a part of the article to which it is applied.

The Standard Welding Company, of Cleveland, Ohio, will exhibit a wide variety of electrically welded automobile parts. These will include many new samples, some of which are intricate in their design and construction. Among these will be seen several types of detachable and demountable rims, and quite a variety of motor exhaust manifolds, together with motorcycle and bicycle rims and frame parts.

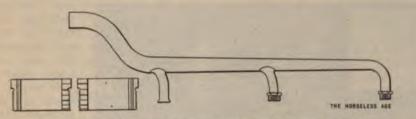

Thomas Prosser & Son, 15 Gold street, New York, who are the United States representatives of the Krupp Steel Works in Essen, Germany, will exhibit a variety of forgings of automobile parts, chiefly crank shafts, gear blanks, front axles and rear stationary axles, made from Krupp alloy steels. These forgings are used to quite an extent in the high grade cars on the American market.

Columbia Nut and Bolt Company, Bridgeport, Conn., will show their Columbia lock nut, which consists of two parts, one within the other. The inner part is split and is of hexagonal, tapering form; it fits into a hexagonal tapering opening in the outer part. As the nut is being drawn up by means of a wrench applied to the outer part, the inner, split part is tightly compressed on the thread, whereby the nut is securely locked.

The exhibit of the William Cramp & Sons Ship and Engine Building Company, of Philadelphia, will consist of castings of Parsons' manganese bronze, such as axles, lamp brackets, engine frames, connecting rods, transmission gear cases, brake bands and Parsons' white brass bearing castings.

A. O. Smith Company, Milwaukee, Wis., exhibit samples of their pressed steel automobile frames and other pressed steel parts. The company claim to have produced 60 per cent. of all the pressed steel automobile frames used by American manufacturers during the past year.

The Lebanon Steel Casting Company, Lebanon, Pa., will show a large quantity of steel castings, consisting of sprockets, hubs, gears and other automobile parts.

GAS ENGINE MANIFOLD, SHOWING "DIVPLUG" CONNECTIONS.

take and outlet manifolds, and other forms of brass and copper tubing for automobile work; also exhaust manifolds made from seamless steel tubing, and exhaust pipes of seamless tubing, with which is used their patent Divplug for cylinder connections.

Hayes Manufacturing Company, Detroit, Mich., will show a line of sheet metal automobile parts and accessories, such as radiators, hoods, fenders, motor and garage pans, metal tool and battery boxes and forged irons. They have patterns and dies to make fenders, forged irons, tool and battery boxes for most of the standard makes of cars.

The H. W. Johns-Manville Company, of too William street, New York, will display their line of asbestos packing and brake lining; No-Leak, a chemical packing compound; dry powder and chemical fire extinguishers, asbestos wood, asbestos roofing and siding, and automobile friction tape. The asbestos packing is known as Mobolene gas and gasoline engine packing, and

HAYES PRESSED STEEL TOOL BOX.

### Signaling Devices.

The Sireno Company, 39 Cortlandt street, New York city, will show eight different styles of Sireno horns. The Sireno Midget, the smallest of the horns, will be specially featured, together with the Sireno steering wheel switch and special floor board switch. The Sireno Midget is about 9 inches long over all, and weighs but 3 pounds. It is claimed that its tone closely resembles the human voice, and is an agreeable sound. The steering wheel switch is designed to be attached to a spoke in the steering wheel. The wires running from the switch are enclosed in a flexible brass tube. The floor switch is designed for heel operation, to be attached to the floor boards and projects through the bottom, the wires being attached by means of split spring plugs, allowing the floor board to be easily removed without disturbing the wires.

Lovell-McConnell Manufacturing Company, of Newark, N. J., will show the full line of Klaxon signaling devices manufactured by them. In sound and operation the Klaxon is unlike any other warning signal for automobiles. It is operated by an electric motor running at 3,000 r. p. m., and using current from the ignition battery. At the top of the motor shaft is a toothed wheel which strikes a hardened button in the centre of a 5½ inch steel diaphragm, producing 500 double vibrations per second. The effect is a bass toned roar, loud

enough to be heard a half mile away, and of a characteristic attention-compelling quality which distinguishes it from all other sounds. The Klaxon comes in many different sizes, suitable for every signaling purpose for automobile, motor boats, etc. The Lacoste timer and insulated wire terminal will also be shown.

Nightingale Whistle Manufacturing Company, 1777 Broadway, New York, exhibit the signaling device known as the Nightingale whistle. When they first took over the whistle from the French firm which introduced it into this country they reduced the price to \$7. They then perfected the method of attaching the device to cars, and claim that it is now possible for anyone,

KLANON SIGNALING DEVICE.

not necessarily a mechanic, to attach the whistle in less than an hour. They carry a stock of special clamps to fit any exhaust pipe, thus simplifying the attachment. A new motorcycle signal known as the "Midget Nightingale" has just been brought out. This company also handles a compressed air outfit for garages, comprising the Delpeuch air compressor, which the company has been marketing for two years, a storage tank with safety valve, globe valve and all necessary fittings. The compressor is of metal throughout, containing no leather washers or packing.

The Nonpareil Horn Manufacturing Company, 139 Emerson place, Brooklyn, N. Y., will display their complete line of horns, bulbs, reeds and flexible tubing. A new oval bell reed in the centre of the tube horn, with a deep, pleasing tone, willbe shown, with an entirely new model with several large very compact coils, and an exceptionally deep, clear tone.

The Gabriel Horn Manufacturing Company, Cleveland, Ohio, one of the pioneers in the manufacture of horns of the exhaust blown type, will show their regular line, besides their new four tube horn, known as the Gabriel trumpet. This is a horn operated by keys so arranged that all the bugle calls used in the United States Army can be played on it. They also have a ten note "music horn," which can be used to play almost any of the simpler melodies. They are also showing the Foster shock absorber, recently described by us.

### Garage Appliances, Jacks, Tools, Etc.

The Dover Stamping and Manufacturing Company, 385 Putnam avenue, Cambridge, Mass., will display their complete line of sheet metal automobile specialties, chief of which will be their new shut-off funnels, new garage measure and new tourist oil and gasoline kit. In connection with the above will be shown a wide variety of hand oil and storage oil cans, including the compact oiler, auto pump oiler, squirt cans and non-leakable steel oilers, besides waste cans, garage pails, drip pans and motor boat fog horns.

The Elite Manufacturing Company, of Ashland, Ohio, will display their line of lifting jacks and storage jacks. They have a new lifting jack, with adjustment from 12 to 27 inches, with a handle so arranged that when the load is raised it falls closely to the stand and is out of the way. The Reliable tire saver, another new production, is used to relieve the tires of their weight. This is constructed of malleable iron, and has a swivel top and leather faced saddle, which when placed under the hub takes up practically no room, and enables one to place machines in the garage as closely as desired. The storage stand is used for the same purpose as the tire saver, but is a lit-

ELITE JACK.

tle cheaper. The ratchet jack is known as the "Ohio" ratchet. It is new and has several commendable features.

HYDRAULIC STORAGE SYSTEM.

Janney, Steinmetz & Co., of Philadelphia. will have on exhibition various sizes of their well known seamless steel tinned and tested tanks, including a new oval shape. They will show tanks adapted for both gasoline and compressed air. Since these tanks are of seamless construction they are claimed to be absolutely free from the possibility of leakage. They will also have on exhibition their "Flashlight" spark plug, which is fitted with platinum iridium points, rendering it particularly well adapted for use with magnetos. They will also show various designs of pressed steel brake drums, and will have on exhibition for the first time two types of gasoline storage outfits of 55 and 110 gallons capacity. respectively. The tanks for these outfits, will be welded-seamless construction and they will be equipped with two types of pumps, one for use directly over the tank and the other for use when the tank is located at some distance from the pump. They will also have at their booth samples of "Richards" aluminum solder, the sale of which is controlled by them.

JANNEY-STEINMETZ GASOLINE TANK

The Hydraulic Oil Storage Company, of New York, will exhibit the Hydraulic ga rage gasoline system with its counterlalance and flexible seamless copper hose, whereby, it is claimed, a car can be filled with gasoline without the driver leaving bit seat, in 40 seconds, as against 12 to 20 mm utes when the gasoline is strained through chamois. In connection with this system will also be shown a new float sight gange which is always in plain view of the open ator. The especial features of the hydradic system are the "full tank" and top feel These are claimed to prevent dirt and water getting into the tank and to obvine danger, evaporation, and the necessity of straining.

Coes Wrench Company, Worcester, Mass., will display it sizes and styles of their wrenches, comprising mechanics model, round bandle, knife handle, hammer handle and sted handle models. The proppal feature of the exhibit will be the Coes steel handle screw wrench, with a ball for

screw thrust. The handle is a shell internally supported. A steel ball is inserted into the face of the bar and runs in a new ground on the screw next to the knurled thumbscrew, the screw being forged and hardened. Another feature is a 6 mm wrench, with an opening of 1 me inches, which can be handily carried in the power if desired.

The A. S. Noonan Tool and Machine Works, of Rome, N. Y., will display a nost complete line of tools and specializes Noonan's chisels and punches will be shown and a severe demonstration given. This test will consist of driving these chisels through heavy pieces of iron. The exhibit will include something new in a swage to repair front oval knuckle arms and tie rod connections. Another new tool is an automore chuck for locating and attaching speedon eter gears to a front wheel hub so they will run concentric with the hub. In addition to the above, there will be shown trunk racks, valve truers, valve spring lifters, fire tools, bent end screw drivers, cotter pin tools, tire irons, the "Four-in-One" tool. consisting of a valve, top, die and reamet, wheel removers, muffler cut-outs, thus clamps, roberails, foot rests, a clamp for npairing motorcycle chains and a tool for repairing belts.

Cryder & Co., Park avenue and Sixtythird street, New York, are showing as

their leader the Ronson wrench, the Kempshall tire, the Marles blow-out patch, Acheson Oildag and graphite greases and the Hermetic frictionless tire lug. The Ronson wrench is composed of four open end wrenches with openings from three-sixteenth up to thirteen-sixteenth inch. These are held together by means of a small, square shouldered bolt, washer and thumb screw. The whole combination can be conveniently carried in a tool kit and replaces tools that would take up much room in a tool box. The combination gives nine distinct wrenches with a total weight of only a half pound. The openings for the wrenches are set eccentric, which gives a wide range of use, permitting one to get into inaccessible places, and owing to their thinness the wrenches can be operated through very narrow openings.

S. F. Bowser & Co., of Fort Wayne, Ind., will show a varied line of their product. They will present representative outfits from their automobile accessories department for private and public garages. They will show portable and stationary gasoline tanks, their oil tanks—self measuring and fireproof—and their pump meters and filters.

The Wayne Oil Tank and Pump Company, Fort Wayne, Ind., will exhibit their

line of oil and gasoline storing and pumping apparatuses. The oil tanks are made of heavy sheet metal, and have the pump secured to the top, while what is known as the long distance gasoline storage outfit consists of a steel barrel with filling tube, buried in the ground, outside the building, and connected by means of a pipe to the pump inside the garage.

The Oliver Manufacturing Company, Chicago, Ill. The Oliver jack is of the double ratchet type, a motion of the lever either up or down lifting the car. They are made in various heights, from 10 to 13 inches, and with a lift of from 7 to 9 inches. The handle is so formed as to make a good tire tool in case of necessity.

Motor Parts Company, Plainfield, N. J., will exhibit their Auto-Clé wrenches, a set of socket wrenches and their automobile steps. The company was formerly known as the Q. M. S. Co., and has exhibited at a number of previous shows.

The Perfection Wrench Company, Port Chester, N. Y., will exhibit the Perfection quick adjustable wrench. This wrench adjusts itself to nuts of various sizes instantly. It is made entirely of steel of good length to lend leverage.

### Carburetors, Oilers, Pumps.

The Gasoline Motor Efficiency Company, of Jersey City, N. J., are displaying a new device, known as the "Homo," which is inserted between the intake manifold and the carburetor. It contains a wheel with propeller blade spokes, which is covered with galvanized iron wire gauze. The wheel revolves inside the gauze upon hardened steel pivots set into bronze cup screws, owing to the action on it of the incoming charge, and this is claimed to break the gasoline up into very small particles and to cause the air to be perfectly saturated therewith. The casting or housing containing this wheel and wire gauze is 11/4 inches in thickness, and sets anywhere between the carburetor and the intake manifold.

The Stromberg Motor Devices Company, Chicago, Ill., will make a feature of a 500 horse power carburetor complete in every detail, which will be exhibited in addition to their regular line, which includes a water jacketed carburetor, a concentric type carburetor and a new carburetor designed specially for six cylinder motors, which is automatic in its action and which, as far as appearance is concerned, is very similar to the water jacket type.

Wheeler & Schebler, of Indianapolis, Ind., will show their full line of carburetors, together with parts of same showing the construction and adjustment of the various types. An entirely new model will be shown, known as Model L. This type has many features which are standard of all Schebler carburetors, and has the fol-

lowing new features: The air valve is arranged to draw air from the top to the bottom. The leather air valve is backed up by a brass plate, preventing danger of buckling. It has a long bearing or sleeve, and travels on a rod supported at both ends, insuring perfect alignment. The amount of fuel entering the mixing chamber is controlled automatically by means of a needle valve directly connected to a roller operating on a track adjustable to different profiles. Adjustment for low speed is made direct with the needle, and for high and intermediate speeds by varying the track.

A. R. Mosler & Co., 163 West Twentyninth street, New York, have added a carburetor to their line of ignition specialties. This carburetor is the design of George A. Breeze, who has been making carburetors for many years. A priming device without moving parts is embodied in the lock nut which holds the fuel bowl to the main body. This nut also forms the opening for the main air intake and is covered by a wire screen. When the carburetor is primed a cup in the bottom of this nut catches the overflow of gasoline, and this overflow spreads by capillary attraction over the whole wire screen. On turning the engine over, the air drawn through the screen is sure to take up a sufficient amount of gasoline. The screen also prevents backfiring. fuel strainer excludes dust and dirt, thus obviating flooding. The carburetor is of the float feed central draught type and embodies the Venturi tube principle. The large auto machine air valve is placed horizontally, to obviate fluttering, due to jouncing on rough roads. It can be adjusted with the fingers. A graduated disc and ratchet spring on top facilitate setting of the fuel valve. The gasoline connection is for a ¾ inch pipe and can be turned, at any angle.

The Breeze Carburetor Company, of 276 Halsey street, Newark, N. J., will exhibit the automatic Breeze carburetor in several sizes, the Breeze fuel strainer, Breeze check valve and their new Breeze Baby motorcycle carburetor. The fuel strainer is designed for insertion in the gasoline line as close as possible to the carburetor, and collects oil and sediment that may be in the gasoline. The M. C. Special is an automatic type of Breeze carburetor designed for motorcycles. In this model the auxiliary air valve is placed on the back end of the mixing chamber, allowing for an increase in the auxiliary air.

Siro Carburetor Manufacturing Company, 27-35 Taylor street, Springfield, Mass., will show a line of their Siro carburetors, which are mechanically controlled. At the bottom there is a deep bowl shaped casting, forming the float chamber, and a curved tubular fitting, forming the mixing chamber, is cast integral with the cover plate of the float chamber. The gasoline feed can be adjusted at will by the operator by means of a needle valve. An air damper valve is placed near the opening of the air admission elbow, and the throttle valve and dosing device are mechanically interconnected. The carburetor is controlled through a gear and ball bearing shaft connections.

Byrne, Kingston & Co., Kokomo, Ind., will exhibit the Kingston carburetor, which is of the floating ball type, with single adjustment. The special feature of this carburetor consists in the provision of five supplementary air inlets, which are controlled by bronze ball valves. The fuel adjusting valve is located centrally at the top of the carburetor, which makes it unusually accessible.

### Benz Private Exhibit.

The Benz Auto Import Company of America have issued an announcement to the effect that they will not exhibit at either of the New York shows, but will have a private display of Benz 1910 models at their showrooms at 1599-1601 Broadway during the two show weeks.

Among the many valuable trophies which will be exhibited by the members of the Importers' Automobile Salon at the A. M. C. M. A. Show in the Grand Central Palace during the first week in January is the Grand Prize of the Automobile Club of America. This is a solid cup containing 18 pounds of pure gold, and was won by Lewis Wagner in Savannah in a Fiat.

### Differentials, Steering Gear, Shock Absorbers, Brakes.

Kilgore Manufacturing Company, of 585 Boylston Street, Boston, Mass., will have on exhibition their line of air cushioned shock eliminators, including their new model for light cars of 2,000 pounds and under. The new shock absorber is 2½ inches in diameter, and has a recoil check in the side which reduces the recoil, as

MODEL 1910 KILGORE AIR SHOCK ABSORBER.

well as cushions the downward plunge, thus protecting the springs both down and up. They are also exhibiting a longer cushion for the rear which will allow a greater spring play, and yet absorb the excessive motion of the springs in a cushion of air.

Ernst Flentje, Cambridge, Mass., will show his improved glycerine hydraulic jounce and recoil preventer for automobiles. The 1910 model has an improved and larger stuffing box in which a spiral spring is placed over the packing. This spring takes up all the settling of the packing and prevents leaking of the filler. The piston rod is also lubricated by means of the packing, and consequently does not need any oil whatever. The piston itself contains an adjustable valve through which the preventer can be instantly adjusted. This valve is said to be positive in its action.

The Royal Equipment Company, 165 Housatonic avenue, Bridgeport, Conn., will exhibit the Raymond brake, the Duplex brake, Raybestos friction lining, Besto friction lining and Stability facing. The Raymond brakes are well known. The Duplex brake is a double acting brake for machinery and vehicles where the braking effect needed is relatively large, compared with the operating force. The well known wrap-

ping or winding effect of a flexible band surrounding and in contact with a rotating drum insures this result. One end of the flexible band is fixed, while the operating force is applied to the other end in the direction of the rotation. In order to secure this effect in both directions of rotation means are provided by which either end of the band automatically becomes the fixed end, depending upon the direction of rotation of the drum.

The Hartford Suspension Company, of Jersey City, N. J., manufacturers of the Truffault shock absorbers, will display two miniature automobiles, one equipped with shock absorbers, the other not. The wheels of the two cars are revolved by pulleys under each. On these pulleys are two projections of uniform size which come in contact simultaneously with the wheels of the cars at a speed of 100 r. p. m. Each of the cars thus gets 200 bumps every 60 seconds, producing the same effect, as regards the riding qualities of cars, as if they were going over an extremely rough road. The cars are identical in every respect, and the shock absorbers with which the one is equipped are exact duplicates of the larger shock absorbers made by this company.

The Gemmer Manufacturing Company, 741 Merrick avenue, Detroit, Mich., will exhibit their three types of steering gears. While retaining the same general design as before before, the product of this company has been refined and improved in general construction. The spider of the wheel has been made stronger and of better appearance. To the standard line of wheels, which includes the types with aluminum spider and mahogany laminated rim, has been added one with aluminum spider and molded rubber rim. One of the important improvements shown is the universal form of housing, which may be placed at any angle and may readily be attached to any car. Columns are now furnished of 11/2. 13/4 and 2 inches diameter.

R. E. Dietz Company, 60 Laight street, New York, exhibit their line of automobile lamps, including kerosene, side and tail lamps, the Dietz Majestic Mirror lens headlight and acetylene generators. The company have also recently brought out new designs of electric headlights, which will be shown along with their former goods.

Heinze Electric Company, Lowell, Mass., exhibit the Heinze new low tension magneto, which has been fully described in these columns. It is claimed for this magneto that it will insure proper ignition at as low a speed as 50 r. p. m. of the motor. They also exhibit Heinze spark coils, which are made in considerable variety, both of the plain and vibrator type. Their line of ignition specialties also includes timers and switches.

The Rushmore Dynamo Works, Plainfield, N. J., will feature their Multiplex

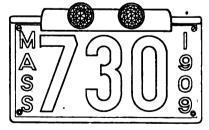

lamps. These have a number of glass strips in the front door designed to reflect the rays of light so that they cross each other. thereby forming a horizontal spreading beam. Each of the strips produces such a spreading beam of a width nearly equal to the entire illuminated field. These several beams (from four to six in number, according to the size of the lamp) overlap each other, so that the total illumination is the sum of the several superposed spreading beams. The effect of thus dividing up and superposing the illumination is said to be that swaying of the flame becomes imperceptible. The exhibit will also include the Rushmore automatic shaking grate generator in its new form, and the old style lamp, with plain glass strips in the front door.

The Woven Steel Hose and Rubber Company, of Trenton, N. J., will exhibit a line of autobestine brake lining. This is a combination of mineral and fireproof substances, and is claimed to be indestructible under any degree of heat. In connection with this will be seen mechanical rubber goods, steam and hydraulic packings.

J. H. Sager, Rochester, N. Y., exhibits the Sager coiled spring equalizer and the Sager bumper. The equalizer consists of a barrel shaped coiled spring under tension, which is inserted betwen the axle and the frame of the car, and acts in the same manner as a shock absorber.

The Baldwin Chain and Manufacturing Company, Worcester, Mass., will exhibit, besides their regular well known line of chains, a new steering gear, which will be seen for the first time. This steering gear will be made the chief feature of their booth

Gray & Davis, Amesbury, Mass., will exhibit their full line of lamps, including a new type of gas lamp. This is a close coupled lamp, and will be shown in two series of styles, one with large flaring flange or opening in front to allow the light to spread; the other of searchlight form, with a small flaring flange. Both styles are equipped with a front silver reflector put in for looks and reflecting powers. There will also be seen combination gas and electric lamps. The

GRAY & DAVIS REAR ELECTRIC LAMP AND NUMBER.

electric lamp can be folded down out of the way when gas is being used.

Frank H. Cross, 1773 Broadway, New York, will feature a close coupled, short focus acetylene gas head lamp of original design. This lamp has a body of heavy gauge brass spun in one piece and a short focus mirror claimed to be of great light giving qualities. There is a gas chamber at the base of the burner to prevent flickering of the flame, and does away with the need for a rubber bulb on the pipe line. All parts of the lamp are said to be easily replaceable. The various lines to be exhibited by Mr. Cross are as follows: Hofacker's automobile head, side and tail lamps, swivel searchlights, electric auto lamps, storage batteries and gas generators; brass robe and foot rails, bumpers and other brass goods; National gasoline tank gauges and portable steam vulcanizers; tool rolls and repair gloves of water and grease proof material, and the Hazen-Brown Company's rubber cement, cold vulcanizing substitute, rubber acid cure, etc.

The Edmunds & Jones Manufacturing Company, of 432 Lawton avenue, Detroit, Mich., will exhibit a full line of their gas searchlights, headlights, oil side and tail lamps, and the E. & J. generators. One feature of their lamps is that they are all readily interchangeable for electric usage. Few changes will be noticed in this line, and these have been made to improve the oil equipment.

Manhattan Screw and Stamping Works, West End avenue and Sixty-seventh street, New York city, will exhibit as a leader the Phoebus gas lamps manufactured by them. in connection with the rest of their line of lamps, tire pumps, generators, etc. The Phoebus lamps are made of two shells, each supporting the other, with all couplings on the inner one. The gas connection at the bottom of the lamp is a swivel, and can be turned to any angle of a circle. Several styles of oil lamps will also be shown.

The Atwood-Castle Company, Amesbury, Mass., will display a complete line of lamps, several of which are new. A new oil side lamp will also be shown, with a combination oil and electric attachment, together with electric head and side lights.

The Badger Brass Company, of Kenosha, Wis., will exhibit their very complete line of acetylene gas lamps and generators, electric side and tail lamps and oil side and tail lamps.

The C. M. Hall Lamp Company, Detroit, Mich., will display a very comprehensive line of automobile lamps, gas headlights, oil side and tail lamps.

### Engines, Clutches, Change Gears.

The Cotta Transmission Company, 250 Mill street, Rockford, Ill., will display samples of their transmissions, together with control levers and parts of the transmissions. The parts will show the construction, material and bearings, as well as give a thorough illustration of the several designs. The list includes selective sliding gear transmissions for shaft and chain drive, pleasure cars and commercial vehicles. The commercial vehicle transmission ranges from light delivery wagons up to and including 5 ton trucks.

The Warner Manufacturing Company, of Toledo, Ohio, will show a line of transmission gears, both planetary and selective sliding, together with differential, spur and bevel gears and pinions, and steering gears; the separate parts of these several models exhibited will illustrate fully the material and the methods of machining.

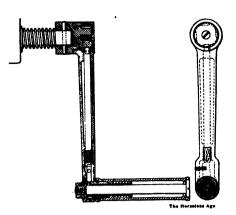

Merchant & Evans Company, Philadelphia, Pa., will display a complete line of their metals, together with products of their mechanical department. The latter include the Hele-Shaw clutch, in all sizes, from 10 to 100 horse power, for pleasure cars and trucks. They will also exhibit the Star pressed steel tire and tool case, on which they have been awarded the exclusive patent rights. This is being produced in two sizes, 34 and 36 inch. The Star baggage carrier for the rear of cars, which, with the Star tire case, makes a complete storage outfit for motor cars, will also be shown, together with their front axle and their new rear axle transmission, complete with brake

The L. A. W. Motor Company, of Providence, R. I., will show a self firing, two cy-

cle, air cooled, six cylinder rotary motor of about 30 horse power. The motor has 2½ inch bore and 2½ inch stroke. On both ends of the wrist pins are D. W. F. ball bearings, which rotate in a perfect circle. The central shaft is offset 1¼ inches from the centre of the circle. The motor is made self firing by each explosion firing the succeeding charge through a small passage in the stationary supply cylinder, the passage being uncovered immediately after the firing of each cylinder. Charge is admitted to the cylinders through a port in the supply cylinder that is uncovered immediately after the exhaust ports have been uncovered.

The Hilton Manufacturing Company, 15 State street, Boston, Mass., will show among other things the Hilton safety starting device for automobile motors, and also a rear starting device for use on motor boats. The device as used on automobiles is all contained in the starting crank, and requires no specially skillful labor to attach to any automobile, as all that is necessary is to remove the old crank and pin the Hilton device in its place. It is claimed that it is impossible to get injured by the motor kicking while cranking with this device.

The Muncie Gear Works, Muncie, Ind., will display a jack shaft and transmission of planetary type suitable for motor trucks of 20 to 35 horse power. It comprises a nickel steel axle and a bevel type differential encased in an oiltight housing, with adjustable ball bearings next to the driving sprockets. The planetary transmission is mounted on adjustable ball bearings. The driving bevel pinion has two rear ball bearings and a plain forward bearing, while the large driven bevel gear is backed up at the

HILTON SAFETY STARTING CRANK.

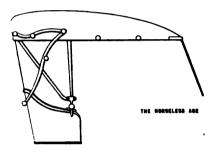

point of contact with a bronze shoe to prevent being forced away from the driving pinion during a heavy pull. The clutch is independent of the transmission and free from end thrust. The special feature of the multiple disc clutch is the toggle joint locking device, which forces the large diameter discs together, giving a strong yet sensitive and smooth action.

The Warner Gear Company, of Muncie, Ind., specialize in transmissions, and will show a new transmission, combined with a multiple disc clutch. Their line of steering gears will also be shown. All their steering devices are of worm and gear type, with stationary spark and throttle controls above the spider. The steering gear is provided with outside adjustment in all directions for taking up wear, and has ball end thrust bearings to eliminate friction and insure easy steering. Rear axle differentials of both the bevel and spur type are also to be exhibited, as well as material specifications for their cover alloy. The transmissions are all of the selective type, with the sliding gears automatically locked in and out of mesh. The new multiple disc transmissions are so arranged that the clutch is mounted in a separate housing. which is cast integral with the transmission case. The clutches are composed of sixtythree discs of heat treated saw blade steel. which revolve in an oil bath.

The Excelsior Motor Manufacturing Company, Chicago, Ill., will exhibit their latest type of motor, which is a four cylinder, water cooled, four cycle, with cylinders cast in pairs, having 41/4 inch bore and 51/8 inch stroke. The principal feature of the motor is its system of lubrication. This is by means of a geared pump attached to the bottom of the crank case, which pumps the oil through copper tubes to the three main bearings, from whence it is carried through the hollow crank shaft to the crank pin bearings, and from there through copper tubes to the piston rod bearings, thus lubricating the piston pin bearings. The water connection pipes are of copper tubing throughout.

Peter A. Frasse & Co., 130 Worth street, New York city, distributors for Shelby steel tubing, will show a line which includes has two lamps elevated to a point just below the line of vision of the driver. The lamp at the right of the driver can be operated to throw the light at either side, or up and down in any angle desired, and reset to its normal position instantly, and can be locked in any position.

The Westchester Appliance Company, 15 Canal place, New York city, will exhibit their line of tops, together with a full line of accessories. Principal among the accessories shown will be the Westchester dry battery. This battery is guaranteed to show twenty-five amperes shelf test three months from the date it leaves the factory. The Westchester storage battery and spark plug will be shown, while the Westchester speedometer will be a new feature added to the list. The display will also include Westchester carbon remover and metal polish.

DUQUESNE RUNABOUT TOP.

The Hill Manufacturing Company, of Buffalo, N. Y., will show a line of automobile tops, bodies, seats, leather trimmings, cushions and backs, and several designs of folding seats, single rumble seats and a wind shield which they have but recently produced. The line of folding auxiliary seats is most complete, comprising many shapes and designs, from the ordinary folding type to the disappearing style.

The Sprague Umbrella Company, Norwalk, Ohio, will exhibit two new wind shields in connection with their otherwise very complete line of this class of goods. One of these is an air cushioned leader wind shield, called Sprague's Special, while the other is an enameled wind shield which has no brass on it. In connection with these will be shown new tops for touring cars and for runabouts made in Duquesne style.

I. C. Chase & Co., 89 Franklin street, Boston. Mass., will display a complete assortment of Auto top fabrics, in all the popular and suitable materials, including mohairs, mackintosh fabrics, worsteds, etc.; also Chase leather in weights adapted to all grades of cars, together with Chase rubber, which is also used for top work on carriages and automobiles.

According to a report from Baltimore, local promoters have secured the old Pimlico race track near that city, and will arrange a number of twenty-four hour races next season. All races will be invitation affairs.

### Oils, Greases, Polishes, Etc.

Valentine & Co., 257 Broadway, New York, will exhibit a full line of Vanadium automobile varnishes, which were first placed on the market early in 1909, and are said to represent the result of several years' effort to produce varnishes specially adapted to the exacting requirements of the automobile trade. These varnishes are claimed to be very full in body, yet easy working and free flowing, and to dry quick and hard. They are said to be not only very brilliant when first applied but to remain so, and to be least affected by mud, grease, oil, etc. This line of Vanadium varnishes also includes a special line of pale goods. The Valentine Company will also exhibit a full line of automobile colors, among the latest being "phenomenal carmine," "fire blue," new maroon and "Hudson" and "Marathon" grays.

George A. Haws, 73 Pine street, New York city, will exhibit a complete line of Panhard oils and greases manufactured by him. A lubricant for every conceivable wearing surface of an automobile has been supplied, and no additions to the line have been made recently, but an effort has been made to make these packages more attractive in appearance and more convenient for handling. The red and white checkerboard design is retained to distinguish this line of lubricants from all others. Panhard cylinder oils of various weights, together with transmission oils and compounds, nonfluid transmission greases, cup grease, graphite grease and cork graphite grease will be shown.

W. P. Miller's Sons, Mott avenue and Hancock street, Long Island City, N. Y., will exhibit their full line of light, medium and extra heavy auto cylinder oils, the last being a grade of Pan-O-Lite. Formerly Pan-O-Lite oil was made only in one weight. The original grade is now known as heavy Pan-O-Lite oil. In connection with these oils will be shown Miller's grease and Excelsior fibrous oil. They will also distribute free of charge 10,000 cartons containing samples of Miller's grease and of Excelsior fibrous oil.

The Connecticut Oil Company, Waterbury, Conn., will show Connecticut brands of Non-Carbon auto oil and special auto greases. They will also make a special display of the J. P. Davies Buckeye auto soap. They will show grades of lard oil, cylinder oils and grease compounds.

Adam Cook's Sons, 313 West street, New York, will have an elaborate exhibit at which they will show the various consistencies of their product, as well as their grease cups. The qualities of "Albany Grease" will be shown by practical demonstration. The soft grades, No. 0 or No. 1, are especially recommended for transmissions containing both slow and fast running parts.

The Keystone Lubricating Company, of Twentieth street and Allegheny avenue, Philadelphia, Pa., have illustrated in a novel manner the qualities of the Keystone oils and greases. A Mitchell chassis will be shown by them the gears of which will be packed with Keystone grease, and will afford a very effective illustration of the action of Keystone grease in use. There will also be exhibited samples of Keystone motor oil. This is a new oil produced by the company, and has been tested by them for the past eighteen months.

The Clover Manufacturing Company, 151 East 126th street, New York city, will show the regular line of Clover grinding compounds, which are put up in two forms for individual use in 4 ounce duplex cans, containing two grades—coarse for roughing and fine for finishing. For the manufacturer it is put up in six grades—I-A (very fine) and A, B, C, D and E (very coarse)—in one pound cans only.

The Havoline Oil Company, 80 Broad street, New York city, will exhibit their full line of oils and greases, including the special Packard lubricants which they manufacture expressly for the Packard Motor Car Company; also a full line of water white gas engine oils which are designated as Havoline Crystal oils.

The Duffy Grease Company, 520 West Fortieth street, New York city, will demonstrate the efficiency of Duffy grease by means of a motor driven automobile transmission. In connection with the grease will be shown several samples of Duffy oils for gasoline motor lubrication.

Moller & Schumann Company, of Marcy and Flushing avenues, Brooklyn, N. Y., makers of varnishes, will exhibit eighteen panels finished with different colored rubbing varnishes and automobile finishes, together with some new wood finishes for the interior of automobiles.

H. T. Alexander & Co., 17 State street, New York, exhibit their line of automobile oils and greases. They have recently changed their trade name from Panhard to Speedway. They will also exhibit automobile soap.

### Slight Increase in Western Freight Rates.

Freight rates on automobiles from the Eastern and Middle Western terminals to the Pacific Coast have been equalized by the Transcontinental Freight Bureau. The new tariff raises the former rate of \$3.50 per 100 pounds to \$4 on carload shipments. On less than carload shipments the old rate of \$7 still prevails. In raising the rate 50 cents the railroads, however, granted the requests of the automobile men that the minimum be reduced from 12,000 to 10,000 pounds per car, where the car used is less than 42 feet long, and when over that and under 50 feet the minimum to be placed at 12,000 pounds. As reported elsewhere in this issue, California dealers have protested against this raise in rates.

### Supply Dealers and Jobbers.

W. F. Polson, of 27 Chenango street, Buffalo, N. Y., will show five styles of wind shields, tire holders and the Polson bumper. The Polson automatic and Model M wind shields are new, and are designed for comfort as well as ease of operation. The automatic shield is simply lifted up to raise and pulled down to lower, there being no nuts, thumb screws or springs to adjust. It is claimed to lock positively in the

THE POLSON WIND SHIELD.

upright position, at 45 degree to 30 degree angle, or folded. The Model M shield is made to fold, with the upper section hung on trunnions in the centre, and can be set at any angle, either forward or back, making a protection for storm or rain, or creating a breeze in the car on a sultry day, but protecting the eyes from dust and wind.

The United Manufacturers, New York. comprise the Weed Chain Tire Grip Company, the New York and New Jersey Lubricants Company, C. A. Metzger, Inc., the Jones Speedometer Company and the Connecticut Telephone and Electric Company. The lines of these various manufacturers are well known and part described by their names. It might be pointed out that C. A. Metzger has recently bought the plant of the Newark Rivet Works, Newark, N. J., and, in addition to his well known automatic wind shield, will exhibit the friction windshield of the Rivet Works. The Connecticut Telephone and Electric Company are specialists in ignition apparatus, manufacturing a line of coils and switches. They have just brought out a new magneto, of which we expect to print a complete description in an early issue, which will be featured at the show. The Weed Chain Tire Grip Company will have an exhibit of their tire chains. The New York and New Jersey Lubricants Company will be on hand with a full line of motor lubricants, and the Jones Speedometer Company will show their several specialties in the line of speedometers, taximeters and electric horns.

The Garage Equipment Manufacturing Company, of Milwaukee, Wis., will show a full line of brass wind shields, known as the Milwaukee Adjustable; also front end buffers, robe rails, foot rests, tire holders, tool grinders, vulcanizers, etc. Among the assortment of automobile parts and specialties will be found a full line of tire chain grips, steering wheel watch case, electric sockets for oil lamps, storage jacks, tire cases, "Evertight" top bow holders, chain bow spring release tool, and other handy articles.

The Wilson Trading Company, 46 Cortlandt street, New York city, will display a representative collection of the sundries handled by them, which covers the field very completely. No effort is made to specialize on any particular line of goods, but many makes of standard goods in accessory lines are handled.

The Allen Auto Specialty Company, 1926 Broadway, New York city, will exhibit their regular line of tire covers, tire holders, tire locks, lamp covers, universal joint and knuckle grease boots. Two new articles will be shown. One is a tire holder for demountable rim tires. This is a double armed device, forming a brace, with a double bracket fitted under the seat, and also on the dash, and holds the tire very rigidly. The other new article is a tire pressure gauge, which can be used in the dark as well as in the light.

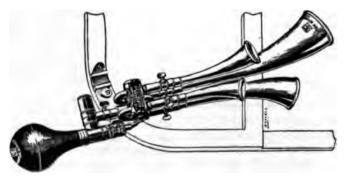

The Standard Leather Washer Manufacturing Company, of 24 Boudinot street, Newark, N. J., will display a full line of Gray's standard touring necessities for 1910. It is the idea of the company to standardize both as to price and quality those articles that are in general use throughout the year. The line at present includes tire

can be easily attached, and is visible at a considerable distance, while at night it can be illuminated by means of a small electric light. The snowshoe can be attached to the wheels of a car without jacking it up, and when not in use can be carried on the running board. The object of the snowshoe is to prevent skidding in sloppy weather.

The Vehicle Apron and Hood Company, of Columbus, Ohio, will exhibit their full line of Gordon motor car supplies, which include tire covers, top hoods, inner patches, headlight and lamp covers, tool rolls, tube cases, cape aprons, auto covers, luggage bags, sleeve protectors, combination lap robes and muffs, and various other water, dust and wind proof articles for comfort and protection.

The Metal Stamping Company, of 50 Hubert street, New York city, will display a complete line of top hardware suitable for automobile tops of all sizes, and in addition to this will show a variety of horns of new patterns; also their regular line of automobile sundries, comprising foot rests, robe rails, tire brackets, wind shields, etc.

Charles E. Miller, 97 Reade street, New York, dealer in parts, fittings, sundries. tools, clothing, American and European novelties for automobiles, motor boats and motorcycles, will show a line covering nearly every need of the motorist, whether owner or driver. Two of the latest articles of foreign origin will be shown. One is the "Testophone," a musical signaling device, which should prove of interest to every motorist, since its tones are very pleasing to the ear, and have resonance enough to command the attention of the most willfully deaf driver on a country road without arousing his ire. The other novelty is a radium watch, in which the hours, the minute and hour hand are

TESTOPHONE SIGNALING DEVICE.

pumps, vulcanizers, tire bands, washers of all kinds and descriptions, metal polish, valve grinding compounds, etc.

Raimes & Co., 50 Ferry street, New York, will exhibit their Globe metal polish, the Erickson gasoline vapor mixer, the Erickson taxicab sign "For Hire" and the Erickson snowshoe for autos. The gasoline vapor mixer can be attached to any carburetor, and is claimed to insure a perfect mixture of air and gasoline gas. The taxicab sign

marked with radium, enabling one to see the time in the darkest night.

The Automobile Supply and Manufacturing Company. Brooklyn, N. Y., will exhibit a line of automobile horns, as well as flexible tubing and flexible shafting for speedometer transmissions. The flexible tubing which is of their own manufacture, will be shown both in the plain and the steel lined forms for all conceivable uses in connection with automobiles, motor boats, etc.

### Miscellaneous Exhibits.

Joseph Tracy, 116 West Thirty-ninth street, New York, shows a fan dynamometer. It consist essentially of a metal standard carrying a horizontal steel shaft in large ball bearings; one end of this shaft is connected to the motor under test by a universally jointed extension shaft; the other end carries an overhung two bladed fan, as shown. On the dynamometer shaft a small pulley, fitted to a boss on the rear of the universal joint, is belted to a larger pulley on the special tachometer, which is mounted on top of the housing that carries the dynamometer shaft. The tachometer has a double scale showing the revolutions per minute and the horse power developed, respectively. The r. p. m. scale is graduated in divisions of twenty revolutions from 200 to 2,000 revolutions. The horse power scale gives a minimum reading of 1 horse power at 480 revolutions, and a maximum reading of 70 horse power at 1,980 revolutions. At all ordinary rates of motor speed a simultaneous reading of r. p. m. and horse power can be obtained without any computation.

The Whitney Manufacturing Company, of Hartford, Conn., will exhibit a very complete line of driving chains and chain belts for automobiles, etc. Also keys and cutters for the Woodruff patent system of keying. In the collection will be seen silent chains, detachable roller chains, detachable bushing chains, block chains, safety connecting links, Presto chucks, collets and friction tapping devices for the rapid change of drills, reamers, counterbores, taps, etc., without stopping the drill press. A special collet for holding shank cutters for cutting Woodruff keyways will be shown. This shows how a cutter may be prevented from turning or slipping endwise in the collet by fitting a No. 2 Whitney key into the shank.

The exhibit of the McCord Manufacturing Company, 2587 Grand Boulevard, Detroit, Mich., will consist of their regular line of radiators, force feed lubricators, radiator fans, circulating pumps, McKim gaskets, etc. One distinct novelty will be a radiator built with a one piece pressed steel frame or shell, instead of the conventional built-up brass frame. This is a new departure in radiator construction and the company expect to build a large share of their radiators during the coming year in this manner. It enables the frame to be finished in baked enamel if it is desired.

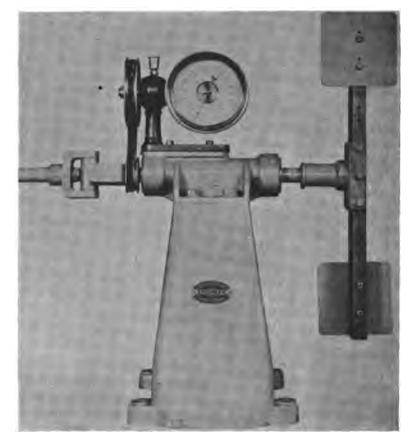

The exhibit of Morrison-Ricker Manufacturing Company, 62 Broad street, Grinnell. Ia., will consist of a large variety of gloves for all seasons. Their "Rist Fit" styles of gloves, mittens and one finger mittens, for cold weather wear, are warmly lined with wool fleece, lamb skin, squirrel, etc. Summer styles are ventilated. Some have short wrists. There will be several new styles of turtleback gauntlets, with strap fasteners or elastic wrists. The stock of

which Grinnell gloves are made is washable. The ventilated and "Rist Fit" remain the leading features.

Spooner & Wells, photographers, of 1931 Broadway, New York, will have a booth surrounded by colored transparencies, backed up with electric lights. The background of the exhibit will be covered with photographs and enlargements, and all the subjects represented in beautiful transparencies. Photographs and enlargements will

mobile contests and tours from the first Glidden and first Vanderbilt Cup race to the corresponding events of the season just past. They will also show photographic enlargements, 8 feet wide, of race accidents and speed pictures.

Fried-Osterman Company, Rockford, Ill., will exhibit their well known line of "Price" gloves, one fingered mittens and mittens. One of the leaders will be a one fingered mitten in pearl washable horsehide, with imported lambskin lining, and black patent leather, extra stiff, wide cuff.

TRACY'S FAN DYNAMOMETER.

be automobiles in various events through the past year, showing many interesting and exciting incidents of track and road contests.

The Y. M. C. A. Automobile School, 318 West Fifty-seventh street. New York, will display pictures, showing how 3.600 men went through their course at the school during the past five years. These 3,600 men have been owners, prospective owners, chauffeurs, and fully one-third of these men have been men who owned their machines. By means of large photographs the shop and toad work of the school will be explained, and also the fact that this is the largest school of its kind in the country. A large aeroplane will also be exhibited, showing the work of the aeronautic class of the West Side Y. M. C. A.

N. Lazarnick, 244 West Forty-second street, New York city, will have an exhibit of protographs and photograph albums, containing views from all the large autoOther gloves are to be seen in reindeer and black washable material, lined and inlined, and black or tan imported Kasan, with imported lamb or rabbit linings.

Rothstein Manufacturing Company, 1941 Park avenue, New York city, will have as a leader a new brass bumper, with no iron parts exposed. They will also show a new style brass tireholder, together with trunk racks, muffler cutouts, valve lifters, lamp brackets, etc.

The Stewart Automobile Academy, of 231 West Fifty-fourth street, New York, will exhibit a sectioned motor, ignition appliances, carburetor, etc.; photographs of their plant, booklets and literature describing fully their courses and methods of instruction, and their equipment.

The National Surety Company, of 115 Broadway, New York, will exhibit their automobile bail bond powers of attorney as usual.

### MAINTENANCE AND REPAIRS.

### Fixtures for Reforming Magneto Cable Ends.

BY C. T. SCHAEFER, C. E.

A handy fixture is shown below, which the writer had occasion to use for reforming the spark plug end of magneto cables used on automobile engines.

Magnetos with cables were bought from one company, and after some time a change was made in the cables and it was found that the new cables were 1-16 inch smaller in diameter, and as a result the terminal for the spark plug end of the cable was too large. Scraping this piece was out of the question, as this would involve considerable delay, which at the time could not be tolerated.

In Fig. 1 is shown the cable end, the diameter A being, as before stated, 1-16 inch too large in diameter. Fig. 2 shows the die for reducing the diameter A. This die

to which a portion of the active material is subjected with each charge and discharge.

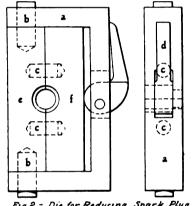

Second—To solution of the set, crystalline lead compounds and precipitation thereof as loose pulverulent compounds. This follows from the formation of concentrated sulphuric acid in the pores of the plates during charge, this dense acid dissolving lead sulphate and reprecipitating it upon contact with the diluted acid at the surface of the plates.

Third—The solution of crystalline lead compounds and reprecipitation as non-crystalline compounds, due to the formation of persulphuric acid at the surface of the positive plates during the gassing period.

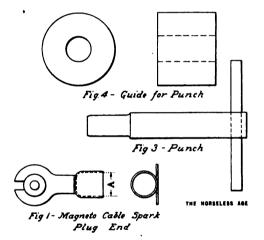

The first source of trouble may be helped in two ways, by less frequent charging and by starting with more thoroughly set .or crystallized plates. It is obvious that with suggested by theory, is: First—To charge at a moderate rate. Second—To recharge only after several partial discharges. Third—To give the gassing charge only occasionally.

These conclusions are fully borne out in practice. The life of batteries is increased by moderate charging, say, the four-hour rate to begin with, and half that rate at the end of the charge. Longer service is secured by infrequent charging. It is not difficult in most installations to defer charging until after several partial discharges, provided these discharges have not stretched over too long a time. A charge following two or three partial discharges on successive days is far better than a charge following each partial discharge.

Fairly complete charges, say, up to 2.4 volts per cell, with the current equal to about half the four-hour rate of discharge, gives longer life to plates than where thorough gassing follows each charge.

was split in order to be able to place the work into it. The part a of the die pivoted on the pins b, which are fastened into the half of the die marked c. The other half was held by the eccentric, which pivoted in a, the pins c locating this half of the die. Fig. 3 shows the punch, and Fig. 4 is a guide for the punch. This work was done by a boy in a small hand press, and the piece trimmed on the end, this being necessitated by the redrawing of the metal.

### The Effect of Frequent and Heavy Charging Upon Pasted Lead Peroxide Plates.

(Paper read by Hugh Rodman before the Society of Automobile Engineers.)

Such plates, in service, and not subjected to abuse, fail by reason of the active mass softening and silting from the face of the plates to the bottom of the jar.

This disintegration is probably due to three causes:

First—An untangling of the set, crystalline mass due to the cycle of changes from peroxide to sulphate and back to peroxide. a battery capacity of 40 miles and a 10-mile run on two successive days, if the charge is deferred until the end of the second run the active mass will have been subjected to one cycle of change of crystallization instead of two cycles, which would have followed recharging after each partial discharge.

The solution of lead compounds by dense sulphuric acid may be partially overcome by the use of thin and porous rather than thick and dense plates, thus giving the sulphuric acid formed during the charge a chance to mix more easily with the dilute, free acid outside the plates. Slow charging will, obviously, serve the same purpose.

The disintegration due to persulphuric acid may be lessened by infrequent, complete gassing charges. It is generally belived that the gassing charge must be given occasionally, but there seems to be no necessity for doing so more than once in, say, two weeks. Certainly it is harmful to gas the plates freely at the end of each charge.

Altogether the best scheme of charging, joolatong, were valued at \$62,000,000.

### A. A. A. Meetings During Madison Square Garden Show Week.

The A. A. A. will have space at both the forthcoming automobile shows in New York. Representatives of the association will be in attendance, and members are invited to make use of the booth, where a telephone will be provided. At the Grand Central Palace Show, headquarters will be at Space 300, and at the Madison Square Garden Show at Space 327 in the Concert Hall. The Automobile Association of London, with which the A. A. A. has reciprocal arrangements, will have a representative in attendance at both booths, and will give information to those contemplating touring abroad.

During the week of the Madison Square Garden Show the following meetings will be held at National Headquarters, 437 Fifth avenue, unless otherwise indicated: Tuesday, January 11, 10 a. m., A. A. A. executive committee monthly meeting, President Lewis R. Speare presiding; Wednesday, January 12, 11 a. m., legislative board. Chairman Charles Thaddeus Terry presiding; Thursday, January 13, 10 a. m., directors' meeting, New York State Automobile Association, President H. A. Meldrum presiding. To be held at Hotel Belmont: Thursday, January 13, 2 p. m., touring information board, Powell Evans, chairman. presiding; Friday, January 14, 10 a. m., second annual reunion A. A. A. State and club secretaries, Frederick H. Elliott, secretary, presiding. Luncheon at 1 o'clock.

During the ten months ending with October, 1909, the importations of India rubber, including Balata gutta percha and guttacolatong, were valued at \$62,000,000.

### THE HORSELESS AGE

Founded in 1895 by E. P. Ingersoll. Every Wednesday.

Published by THE HORSELESS AGE Company.

### Purchasing Second Hand Cars.

Many articles have appeared in automobile papers and elsewhere on the chief points to be looked out for when examining a second hand car with a view to purchase, and on the demonstrations to be required. It is generally considered that more care is necessary in the selection of a second hand than in that of a new machine, because in the former case the purchaser has to guard against badly abused cars as well as against poorly constructed ones. What wonder that the novice casting about for a used car suitable for his purpose is often shamefully imposed upon!

The prospective purchaser of a used car should certainly look at the machines offered him closely and insist upon a demonstration under severe conditions, but some of the advice that has been offered in regard to the course he should pursue has been very ill considered. We have in mind particularly a recent series of articles in a foreign contemporary in which the

writer advised that the customer should require that the engine and other parts be more or less completely dismounted, so that their working parts could be examined individually, and in case the owner refused to have the car dissected, to break off negotiations at once.

The impracticability of this scheme is well brought out by a communication in the paper referred to, commenting on the advice. The writer says substantially: Suppose I am a business man, working at the office all day, and have a small car for sale. When I come home at 6 o'clock p. m. a prospective customer calls on me and requests that I take the machine apart. I put on a pair of overalls, take my tools and go to work. By 10 o'clock I have succeeded in taking the engine apart, when the prospective purchaser notes that the crank shaft bearings show more or less wear-which is to be expected in a used car-excuses himself on the ground that a car in this state of wear would not do for him, and leaves me with several hours of work before me reassembling the car. The next night I might have to do the work over again for some other "prospect." The nuts and bolts of the car would certainly not be improved by the repeated dismounting and reassembling. For this reason the plan would hardly appeal to an owner even if the prospect should offer to furnish a man to do the work.

The above plainly shows that inspection of individual wearing parts is impossible, and it is, moreover, quite unnecessary. In our estimation the prospective purchaser should subject the car to the following examinations and tests:

- I. Examination of all outward parts for condition or state of wear. Even a novice can readily satisfy himself whether the body and upholstering are in a good state of preservation, whether the tires are still good, whether the axles have sagged materially, whether the wheels are out of true, whether the flywheel wobbles, etc.
- 2. The noise given out by the motor and transmission in operation should be carefully noted, for it is a very good indication of the state of preservation of the internal wearing parts. If the car rattles like a threshing machine it will not only be very unpleasant to drive but will soon be fit for the scrap heap.
- 3. A hill test on a hill, with a maximum gradient of at least 10 or 12 per cent. If the car takes this hill it is proof that the cylinder compression is not materially im-

paired, which is a most important point. It also shows that there is no undue friction in the transmission, owing to binding of the bearings, etc.

4. The above tests should preferably be supplemented by a test run over a distance of 50 to 100 miles. The same objection might be urged against giving such demonstrations as against taking the car apart, as the owner of a car could hardly afford to give such long rides to all who might apply for them without a guarantee of their serious intentions. It would seem a fair solution of this problem to ask the customer demanding such a demonstration to pay a deposit of from \$5 to \$10 to insure his bona fides, which would be refunded in case he bought the car. This plan, we believe, is followed by some dealers, and has undoubtedly even more justification in connection with the sale of privately owned used cars.

### Rattling of the Brake Mechanism.

Among the minor sources of noise in the operation of a motor car is the rattling of various parts of the brake mechanism. It is, however, provocative of considerable annoyance, as the sound is irregular and quite noticeable when rough road surfaces are being traversed. The brake bands and shoes, when released, are in a comparatively loose condition, and unless specially prevented are likely to jar against their drums as the rear axle bounds over road irregularities. Special springs adapted to keep the movable brake parts in a stationary position relatively to their drums, or at least to cushion their vibrations, are provided as a preventive against rattling upon some carefully designed cars—these springs sometimes also acting to insure the clearing of the bands when released.

Other parts of the brake rigging develop a tendency to rattle after wear has advanced seriously. This is true of the joints of the operating linkage, and about the only remedy for this, in addition to providing adequate means of lubrication, is to make the parts adjustable for wear, as is done in steering gear linkage.

Quite often in laying out the brake operating parts and locating the rods and releasing springs not enough clearance is allowed between them and other parts of the car, and the long spiral springs commonly used or the rods themselves strike other parts when the car passes over road irregularities, giving rise to considerable noise of an annoying nature.

The ends of the equalizer bar of one set of brakes are usually guided in a fitting attached to the frame side members, and rattling frequently becomes noticeable at these points. A flat spring is generally provided to hold the equalizer bar ends against one side of the guide, but this arrangement seems to prove inadequate in many instances after a short period of exposure to mud and dust.

Now that the ideal which the public has set is "an absolutely quiet car" rather than a fairly noiseless one, such details as the above assume a degree of importance which they never possessed before.

### Activity in the Commercial Field.

For several years past we have from time to time pointed out the exceptional opportunities in the manufacture of commercial vehicles. Some six months ago it became apparent, from reports current among the trade, that quite a number of the men who had been most prominent in developing the pleasure car industry thought that the proper time to take a more active interest in the commercial vehicle problem had arrived. The growth of this idea is now becoming apparent in the incorporation of quite a number of commercial vehicle companies and the projected formation of many

Coming just now, when even some of the more enthusiastic are wondering how many more makers of pleasure vehicles there is room for, the growth of the commercial end of the industry promises to be doubly beneficial. It is interesting to note that the majority of the new commercial vehicle models are of the smaller type, being either small trucks or delivery wagons. It seems that the demand for this type of machine is even more insistent than that for medium and large sized trucks.

Probably no branch of the business offers better opportunities at present than the formation of companies for the delivery of goods in our larger cities. While a great many trucks and delivery wagons will continue to be operated by individual firms, no one who has given any thought to the subject doubts that the great bulk of commercial work will be done by large companies operating systems of large and small delivery and cartage vehicles over prescribed routes according to regular schedules. It is not unlikely that the growth in this direction will be somewhat similar to the extension of trolley service during the past few years. For while the franchises which have given trolley companies practical monopolies will not be a feature of auto trucking, still considerable capital will be required to install adequate services for cartage and delivery work.

### Automobiles and Leather Prices.

Up to five or six years ago the automobile industry was hardly recognized as a perceptible factor in the general commercial activities of the nation, but during the last year or two its growth has been such that its effect upon other lines of business has become quite marked.

The scarcity of high grade machinists created by their absorption by automobile factories has been commented upon in these columns, and the effect upon the rubber trade occasioned by the enormous production of automobile tires is a matter of rather common knowledge.

In the upholstering of automobiles and in the production of numerous parts and accessories an astonishing amount of leather is required, much of it being of the highest grade. It is safe to say that on the average each car produced has about it as much leather as would be required to keep an ordinary sized family in shoes for one year. Boot and shoe manufacturers are attributing to the very large and rather sudden demands of the automobile industry the shortage of leather, particularly of the best grades, which now exists and which has brought about very high prices. It is rather an interesting if not a very pleasant thought that the colossal development of the automobile industry, which has taken place with such incredible rapidity, has actually affected old and established lines of business which are apparently as far as possible from being related to it, but such is the complicated interrelation of modern commercial activity that the most unexpected reactions of one line upon another are constantly taking place.

### Eliminating Minor Inconveniences.

Minor inconveniences are fast being eliminated from motoring, now that the main problems involved have received at least tentative solution. Oftentimes a petty annoyance, through long sufferance, comes to be accepted until someone who is able to rise above the conventional discovers that it may readily be avoided.

Merely as an example of the means by which trivial but yet annoying inconveniences are being guarded against in recent models may be cited the filling of the gasoline tank. Ordinarily, in order to reach the filling cap of the tank under the front seat, one cushion has to be raised and the seat board lifted, and, when the supply has been replenished, the board and cushion have to be replaced. The left hand cushion of most cars shows wear upon its side edges resulting from being slid in and out whenever gasoline is taken on or the supply on hand is measured. It is perfectly practical to avoid the trouble and wear and tear of disturbing the front seat upholsery by bringing the filler tube up through the upholstered division which separates the two front seats, and this has been done upon at least one recent model. The tank may thus be filled, if care be used, without disturbing the front seat passengers, just as may the tank of a pressure feed system

### Coming Events.

December 25 to January 1-Columbus, Ohio, Automobile Show, Auditorium, Columbus A. C.

December 31 to January 7-New York City An nual Show, Grand Central Palace, American Motor Car Manufacturers' Association.

January 1-Philadelphia, Pa., Roadability Run from Philadelphia to Wilsturn, Century Motor Club. Wilmington, Del., and re-

January 8-15-New York Annual Show, Madison Square Garden, Association of Licensed Automobile Manufacturers.

January 10-16-Portland, Ore., Annual Automobile Show.

January 15-29—Philadelphia, Pa., Show, Second Regiment Armory. Automobile

January 17-22-Kansas City, Mo., Automobile Show, Convention Hall, Motor Car Trade Association.

24-29-Portland, Ore., Automobile Tanuary Show, Armory.

### GREAT QUESTIONS OF AUTOMOBILE ENGINEERING.

### Right Hand versus Left Hand Control for Automobiles.

BY W. F. DAVIDSON.

The desirability of standardization of control in automobiles is becoming more apparent now that so many prominent manufacturers have adopted the left hand control for their 1910 models, and in this article the writer will attempt to set forth the chief arguments for and against the different controls, viz., right hand and left hand, and discuss each in the light of his experience and the experience of others.

The advantages and disadvantages of the two controls may be divided into general and purely mechanical, the first division being by far the largest. The advantages and disadvantages of one are, moreover, usually the disadvantages and advantages of the other, so the question may be discussed by considering the claims for and against the left hand control.

The general points brought forth by the advocates of the left hand control are: I. Greater ease in getting in and out of the front seat from the right side of the car. 2. The bringing of the drivers of meeting vehicles next each other, thus lessening the danger of collision.

#### EASE OF INGRESS AND EGRESS.

We will now proceed to examine these points. The first point, that of greater ease in getting in and out of the front seat, is of great importance as regards the convenience of both driver and passenger, especially where the traffic regulations require a vehicle to stop with its right side to the curb, as is now required in most large cities. As is well known, it is very hard, if not almost impossible, to get in or out of the front seat on the driver's side of most cars, even when the control levers are especially arranged to permit it. But it still remains that with the right hand control the passenger on the front seat, and usually the driver, has to get out of the car on the left side and walk around, often in the mud, which is not at all agreeable, nor consistent with the general comforts of modern motoring. The left hand control obviously remedies this fault and scores a great point in its favor. The second point, that it brings the drivers of meeting vehicles together, so that they are able to judge with greater certainty the distance between the vehicles. thus lessening the danger of collision, is well worth consideration, as when two vehicles meet on a narrow road, as often happens in touring, the distance between the two must be judged with great nicety in order to prevent scraping of the mud guards or otherwise damaging the cars.

The objections brought up against the left hand control are, in general: 1. The difficulty of judging the distance from the curb. 2. Difficulty of operating the levers.

3. The difficulty of judging the distance of an overtaken vehicle.

#### JUDGING CURB DISTANCE.

As to the truth of the first claim, there seems to be great difference of opinion, some drivers maintaining that it is more difficult to judge the curb distance with the left hand control, and others that it is no more difficult with one than with the other. However that may be, one thing is certain, that if the curb distance is not properly judged the tires are usually badly damaged, not to mention the damage resulting from undue straining of the wheels and axles, and especially the steering knuckles. Even with the present prevailing right hand control one may see cars in any large city on which the sides of the tires have been badly damaged by cutting on the curb, and if the left hand control increases this the results would prove expensive to the owner.

#### LEFT HAND OPERATION.

The point against the left hand control usually given greatest importance is the difficulty of operating the levers with the left hand. Although, as has often been urged, these operations are comparatively simple and quite easily learned by any one, still this does not appear to cover the difficulty, because a great many people will handle a lever all right with their left hand under ordinary conditions of driving, but in an emergency requiring quick action will reach for a right hand lever, and finding none, will remember that the lever is on the other side and that they must change, by which time the accident which might otherwise have been avoided may have happened. The writer had an experience very much like that recently, although the accident was avoided; he was driving on a rarrow country road when a wagon came out onto the road without any notice. and it was necessary to stop very quickly. Not wishing to trust entirely to the foot brake he reached for the hand brake lever with his right hand, but it was not there and the car had fortunately come to a stop before any damage was done. Such things would probably become less frequent if the left hand control were used entirely, but even then the average man is too right handed not to have some tendency to do such things in an emergency when they are most to be avoided.

### CENTRE CONTROL.

Several designers, recognizing this difficulty, have sought to overcome it by putting the levers on the driver's right side; in other words, by putting them between the two front seats, but the disadvantages of this arrangement seem almost as great as those it is attempted to overcome. In the first place it is rather difficult to arrange the levers, especially the brake lever, so that the driver's arm will have a free chance to move in operating them. The great disadvantage of this is apparent to any one who has driven any of the older models, on which it was often necessary to reach around several corners to get the desired lever. Robes, luggage, or the passenger on the front seat are all apt to get in the driver's way. There are advantages, however, which this arrangement of the levers gives, for it is then possible for the passenger on the front seat to assist the driver, although the writer's experience with this type of control has been unsatisfactory, and he believes it even dangerous, as it gives an opportunity to "grab the reins."

#### OVERTAKING VEHICLES.

The next point against the left hand control is the difficulty of judging the distance of an overtaken vehicle, as, according to the present rule of "pass to the left," the driver would be on the side farthest from the overtaken vehicle. As the left hand control brings the drivers of meeting vehicles next each other that would seem an advantage to offset this disadvantage, but a closer study of the question seems to point in favor of the right hand control, for in the case of meeting vehicles there are two drivers watching and able to judge the distance between the cars, while in the case of the overtaking vehicle there is only one who can well judge the distance, and as this places double responsibility on him it seems as if he should be given the most advantageous position, namely, on the right side of his car.

#### MECHANICAL POINTS.

We now come to the mechanical points in favor of the left hand control. There is only about one point under this heading, and it is that in the right hand control there is considerably greater strain on the right hand springs than on the left hand springs, which may be almost entirely overcome by using the left hand control. These strains arise, first, from the weight of the driver on the right hand side of the car when he is driving alone, as is done a large part of the time the average automobile is in use; second, from the strain due to the tilting effect of the body when the car is running on the right side of a somewhat rounded roadway; another condition which very often exists in average driving, and, last, from the strains due to the torque of the motor, which tends to depress the right hand springs. It is impossible to calculate the first two with any accuracy for general conditions, but calculations of the last show that a motor developing 20 horse power, at 1,000 r. p. m., and mounted in a frame with springs 40 inches apart, will cause a difference in the loads on the right and left

springs of 63 pounds. Of course, this may be counteracted by reversing the direction of rotation of the motor, as some manufacturers have done, although whether this is the reason for it or not the writer is unable to state. The advocates of the left hand control would overcome this objection to the right hand control by putting the driver on the left hand side, in that way securing the other advantages of that kind of control, and at the same time overcoming the unequal strains on the springs, which is very desirable, yet this does not seem to the writer to be a very strong argument, as the same, or nearly the same, result could be obtained by reversing the direction of rotation of the motor, as before noted, should the general advantages of the right hand control appear greater than those of the left hand.

### Power Absorption by Gear Box Lubricants.

I have always held that the use of a very viscous lubricant in the gear box is madvisable, as it must absorb considerable power in resisting the passage of the moving parts, and lately I carried out a series of experiments to ascertain the varying amounts of power absorbed in accordance with the viscosity of the lubricant, and with the extent to which the gear box is filled.

An up to date gear box from a 15 horse power car of well known make was used. It had a total capacity of 3½ gallons, while 2 gallons of oil just sufficed to cover the shafts. This gear box was coupled up by a flexible coupling to an electric motor provided with the necessary measuring instruments.

In all the experiments the second gear was in mesh.

The speed of the main shaft was 1,100 r. p. m.

Readings were taken every ten min-

Each test was run until the temperature became constant.

In the first place the gear box was well lubricated, and then run empty to ascertain the amount of power required to drive the motor and the gear box, and from this was obtained a basis for comparison, as, knowing this constant, all additional absorption of power must be due to the churning action of the gears in the lubricant, or rather to the resistance of the lubricant, in a confined space, to the passage of the gears and other moving parts.

The tables show the figures obtained, and the study of these may be of interest. I will only draw attention to one or two points. The difference between running the gear box dry and running it with only one quart of oil (so that the teeth just dipped into the oil) was practically nil, but as the box was filled up to the shaft almost another horse power was absorbed. With

the box absolutely filled with this oil there was further loss of power. It will be noticed that when greases were employed the absorption of power at once jumped up, as did also the temperature. In the case of one well known grease, which is stated to increase the power and cling to the gears, the worst results were obtained. The makers evidently consider that such adhesiveness is a point in its favor. With the ordinary and less sticky type of yellow motor grease the results were somewhat better.

Taking the extreme cases, it will be noticed that the absorption of power by the lubricant in the box varies from 0.51 to 2.9 horse power. Therefore it seems advisable that motorists, and especially those that have cars of comparatively small power, should be very careful that the minimum amount of power be absorbed uselessly thus. Taking the case of the man with a car of 10 to 15 horse power, it is quite easy for him to expend 10 per cent. of the power in churning up a heavy grease.

I think the tests show that the use of any form of solid lubricant is wasteful of power, and that the same remark also applies to the use of an excessive quantity.

The difficulty of keeping a thin lubricant in the gear box is no doubt serious, and manufacturers do not seem to pay sufficient attention to the question. The system frequently adopted of using felt or fibrous packing is bad, because, firstly, if no means be used for compressing it on the shaft it soon becomes inoperative, and secondly, if an adjustable gland be provided, and is tightened sufficiently to keep in the oil, a remarkable amount of friction is introduced. and consequently power absorbed. The method which might be adopted more generally is that used on all electrical plant and high speed steam engines, and on some petrol motors, viz., the provision on the shaft for a V thrower ring, and a catch box draining back into the gear box.

The other objection to a thin lubricant is that it will not deaden the noise, and, of course, if the gears are badly cut and out of line this is sure to be excessive. But these are exceptions today, and nearly all one's driving, even on small powered cars, is done on top gear with direct drive, and with no wheels in mesh. If more noise results from the small quantity of comparatively thin lubricant I strap a piece of thick saddler's felt round the gear box to deaden it

### To Manufacture Aeroplanes in Indianapolis.

A company for the manufacture of aeroplanes is being organized in Indianapolis. and it will be incorporated within a short time, with an authorized capitalization of \$100,000. Carl G. Fisher, president of the Indianapolis Motor Speedway, who is also identified with the Fisher Automobile Company, the Empire Motor Car Company and the Prest-O-Lite Company, will be one of the principal stockholders. A factory will be established on the third floor of the building of the Fisher Automobile Company. A concern for the manufacture of aeroplane engines is also being formed by Mr. Fisher, A. C. Newby, of the National Motor Vehicle Company; F. H. Wheeler, of Wheeler & Schebler; J. A. Allison, of the Prest-O-Lite Company; Howard Marmon, of the Nordyke & Marmon Company; W. G. Wall, of the National Motor Vehicle Company, and E. A. Moross, of the Indianapolis Motor Speedway.

### Indianapolis to Have Show.

Plans are under way for the annual automobile show which will be held in Indianapolis some time in March. As a preliminary step, the Indianapolis Automobile Trade Association has reorganized with the following officers: President, Fred I. Willis, of the Hearsey-Willis Company; treasurer, Frank L. Moore, of the Fisher Automobile Company, and secretary, Frank B. Willis, of the Willis-Holcomb Company. As usual, each dealer will exhibit in his own salesroom, but there will be a street parade, and the week will close with a trade banquet at a hotel.

### Clutch Slipping; Its Purposes and Effects.

By Albert L. Clough.

Accustomed as every automobile operator is to the practice of slipping the clutch, it is not every one who stops to think just what happens upon these occasions.

Clutch slipping is commonly resorted to for three purposes: (1) To aid in the acceleration of the car from a state of rest. (2) To reduce vehicle speed below that at which the motor will drive it, with closed throttle and late spark, without changing to a lower gear. (3) To help the car over the crest of a hill or through some short stretch of difficult going.

A clutch which engages progressively may be regarded as a crude form of frictional transmission, possessing an efficiency of nearly 100 per cent. when it is in positive engagement and of 0 per cent. when it is entirely out of engagement, with efficiencies decreasing somewhat progressively from 100 per cent. to 0 per cent. as the slip increases from nothing to totality.

When the clutch is in contact, but not sufficiently engaged to start its car or to keep it in motion, its efficiency is also zero, and the energy in foot pounds per minute which it is absorbing from the motor is equal to the frictional torque in pounds existing betwen the two clutch members at their mean radius, times the peripheral speed of the engine driven member in feet per minute at this radius. This energy is dissipated as heat at the contact surfaces. When the clutch is engaged sufficiently to accelerate the car on the level, but is at the same time slipping, the efficiency of transmission is greater than zero, the output of the motor at any instant, minus the input called for at that instant, to effect the acceleration of the car (and to overcome the instantaneous tractive resistance) being the rate of dissipation of energy at the clutch surfaces in the form of heat. If the car is in motion, on the level, but at a speed less than that at which the instantaneous speed of the motor would drive it, if fully clutched in, the difference between motor output and the input received by the car to overcome traction resistances represents the input which is converted into heat at the clutch.

#### IN STARTING.

(1) When a car is to be gently started from rest, on the level, the motor is usually speeded up to perhaps 500 or more r. p. m., and the clutch is very lightly engaged, when the car starts into very slow motion. At the same instant the throttle is opened somewhat—enough to keep up the speed of the motor and simultaneously the clutch is allowed to engage a little more positively. This further increases the car speed relatively to that of the engine, and, by degrees, the car and motor approach and finally attain corresponding speeds, at which time the clutch is in full engagement. After this the throttle opening may be re-

duced from that which prevailed during the period of acceleration, and the car will still move at the speed to which it has been accelerated.

Before the clutch is engaged at all, but after the motor has been speeded, the latter is delivering no output, all the mechanical energy developed being dissipated in engine friction. The balance wheel, however, possesses a certain amount of energy. If the clutch is lightly engaged, without opening the throttle, the motor will slow down, and at its reduced speed does a small amount of external work, a part of the energy formerly consumed in its own friction be-, ing usefully available, since piston and other frictional losses decrease with decreasing speed. Even though the motor furnishes but a horse power or so, the car, if on a level, smooth surface, can be started by very careful letting in of the clutch without further engine speeding. If the car will start from rest at all without stalling the motor it can usually be brought up to the speed corresponding to that of the motor previous to clutch engagement. At the first of the car motion there is a very large discrepancy between the car and engine speeds; the efficiency of the clutch as a transmission device is very low, and very little energy is applied to the car. With each increment of car speed, however, the transmissive efficiency of the clutch increases and a greater proportion of the available output of the motor is applied to moving the car, and less is wasted as heat at the clutch, so that the nearer car and engine speed coincide the more rapid is the tendency for them to come into complete coincidence, and the more rapidly the clutch may be let in.

As in many other instances, "it is the first step that costs."

If the throttle is opened as soon as the clutch begins to engage the turning power will be proportionally greater and the clutch may be let in proportionally more rapidly without danger of reducing motor speed to the stalling point.

When, during the operation of starting, matters are so regulated that the engine speed hardly changes from the time the clutch has just been touched in and that at which engine and car are at corresponding speeds, the stored energy in the balance wheel obviously plays no great part. Of course, at the moment of contacting the clutch there is quite a decrease in engine speed, and the flywheel energy represented by this speed reduction goes to assist in the initial movement of the car very helpfully, as the clutch is then working most inefficiently as a transmission device.

On the contrary, in all cases in which the clutch is let in suddenly the energy in the balance wheel is the main factor. Under these conditions the motor must be speeded very high before engagement takes place. The time elapsing before the motor and car arrive at corresponding speeds is exceedingly brief under these circumstances, and the actual output of the motor during this time is a very small factor as contributing to the energy effective during the period. If the initial speed of the engine is great enough, the energy in the flywheel will be sufficient to accelerate the car before complete engagement occurs to such a speed that at the engine speed corresponding thereto the next compression period can be passed by the motor and stalling be prevented. Should the degree of speeding be less, with the same rapidity of clutch engagement, the engine will stall. Such a start as this is accompanied by a terrific jerk, labored operation of the motor for a moment thereafter (or stalling) and fearful stresses upon all parts, the balance wheel "trying," as it were, to twist itself free from the crank shaft while giving up its stored energy. When running at 1,200 revolutions per minute the energy stored in the flywheel of the average four cylinder motor of 4 inch bore may be taken as at least 10,000 foot pounds, which represents the expenditure of 18 horse power for one

Briefly, the philosophy of clutch slipping at starting is as follows: Such slippage is for the purpose of prolonging the period of acceleration by dividing the speed increase into small increments, each one of which increments is effected by the output of the motor within the time in which the increment takes place. Succeeding increments of speed involve less call for energy from the motor as the clutch efficiency increases with the approach to coincidence between the motor and the car.

#### IN SLOW DRIVING.

(2) Considering now the second occasion for clutch slipping, that of securing a vehicle speed less than that otherwise obtainable with the motor at its lowest practicable rate of rotation, it may be remarked that every automobile engine has a minimum operative speed below which it cannot be made to operate regularly. This is dependent mainly upon the amount of balance wheel capacity provided in proportion to other factors, such as the compression used. The action of the engine becomes jerky and labored below the above mentioned speed limit. Sometimes the minimum engine speed is fixed not by mechanical considerations, but by the carburetor arrangements preventing the regular formation of an explosive mixture at lower speeds, or by the inability of the magneto to generate reliable sparks at lower rates of rotation. It is safe to say that very few four cylinder cars as ordinarily geared can be slowed down to less than, say, 6 miles per hour on the direct drive, even on

smooth, level going, and for a good many such cars 8 or 9 miles is the limit. If it becomes necessary in traffic or under some other circumstances to run slower than this, either a change of gear or slipping of the clutch has to be resorted to.

The average operator has a deep seated aversion to changing gears, especially for short periods, and therefore lowers his speed by slipping the clutch. If car speed is to be reduced but a little below that at which the engine would carry the car if positively clutched in; that is, if only a slight degree of slip is required, clutch slipping works out very well, as the efficiency of transmission of the clutch is relatively good and a fair share of motor output is usefully applied to the car. If, on the other hand, the car speed is reduced nearly to nothing it is very difficult to pick it up again on account of the inefficiency of the clutch, without excessive speeding of the motor. It is the common experience of every motorist that he must resort to a lower gear if the car speed falls very far below that of the motor, but that slight reductions of speed are readily "picked up" without much motor acceleration being needed.

#### DANGER FROM HEATING.

When it comes to slipping the clutch for considerable periods of time under heavy load, the question of the danger from heat there developed forcibly obtrudes itself. The heat developed is independent of the type of clutch used, and depends upon the output of the engine and the degree of slip. The temperatures of the engaging parts of the clutch thus depend upon the rate at which they can get rid of the heat developed, and the liability of damage by heat depends upon temperature and the nature of the materials affected by it. The use for one of the clutch faces of a poorly conductive material, like leather, the structure of which is rapidly broken down by exposure to a high temperature, closely limits the amount of permissible clutch slipping. The use of an asbestos metal gauze combination for the clutch face permits of more slipping without harmful results, as the material is much more highly heat resisting, although about the same as to conductivity. Clutches with all metal engaging surfaces are comparatively free conductors, and dissipate the heat engendered rather rapidly, and the surfaces are unaffected by ordinary temperatures so long as lubrication remains effective. Such clutches, as a rule, whether of the multiple disc or other types, will stand for a considerable amount of slippage, as compared with clutches lined with organic material.

### IN HILL CLIMBING.

(3) The third condition under which clutch slipping is practiced is in hill climbing. When climbing a grade, on the high gear, the motor may slow down to the point at which its action becomes irregular and labored. Assuming, as one may do without very serious error, that engine torque is constant through a wide range of speed, engine output is in proportion

to speed, and at the lowest practicable speed of a motor, at full throttle, its output is very small, perhaps not more than one-fifth its maximum.

The horse power required to take the car up the hill is very nearly in proportion to the speed of the ascent, and, at the rather low speed corresponding with the minimum practicable speed of the motor, is not so great as might be supposed—one may say, in order to have some concrete estimate, a quarter of the full engine output. The trouble is that the heavy torque resistance imposed upon the motor slows it down to such a low speed that its output becomes very low.

If now the clutch is partially released the engine speeds up very substantially under the reduced torque resistance, and its output increases, roughly, in proportion to its increased speed. There is, of course, a large waste of energy at the slipping faces of the clutch, which loss is in proportion to the engine power developed and the percentage of slip, but it may happen that, if the engine and car speeds are not too far out of coincidence, the increased engine outout more than equals the loss of energy in the clutch, in which event the car pulls over the hill upon which it would have stalled had the clutch been kept in full engagement.

Operators who are demonstrating the hill climbing capability of cars to rather uncritical intending purchasers frequently resort to clutch slipping as described above.

"JOCKEYING."

Frequently in clutch slipping, when the operator is endeavoring to coax his car over a hill crest, a close succession of clutch releases and engagements is made use of. When the clutch is released the engine speeds up to nearly its maximum rate before the car has lost much headway, and the energy developed by the motor during these bursts of speed is stored in the balance wheel and becomes available to accelerate the car as soon as engagement occurs. The resort to this method is rather hard upon all parts of the mechanism, and cannot be recommended as a regular practice, especially if the clutch is not one which will take care of a large amount of frictionally developed heat.

### Indiana Road Work Held Up.

A rehearing in gravel road cases has been granted by the Indiana Supreme Court. It was in these cases that the road laws, which provided for the construction of roads by bond issues, which in turn were to be paid by taxation, were declared unconstitutional. Judge Jordan, who wrote the original opinion, was the only judge dissenting from the decision for a rehearing. He said: "I perceive no sufficient reasons for granting the rehearing in this appeal. Viewed from any standpoint, the statute in question, in my opinion, is unconstitutional. I, therefore, vote against granting the petition for rehearing." It is expected that another opinion on the road laws will be made early next year. As a result of the recent decision, holding the laws unconstitutional, about \$2,000,000 worth of work under way has been suspended.

#### How the Klaxon Originated.

The signalling requirements of motor traffic have led to the invention of an entirely new noise device—the Klaxon. The horn, the bell and even the siren were known long before the advent of the automobile, and were only adapted to the new use, while the Klaxon represents an entirely new type of signalling device.

It was by analysis that Miller Reese Hutchison, the inventor of the Acousticon for the deaf, developed the Klaxon. Realizing the limitations of existing signals, he set himself the task of devising one which should make many times the noise of a horn, and yet be free from both complication and tone variation.

Evidently a source of energy was needed. First he tried an electric horn. It had a soft iron diaphragm and an electro magnet. The diaphragm acted as a vibrating armature, on the principle of the electric buzzer. It produced a note of fair volume, but the platinum contacts burned away too fast. Next, he tried a larger diaphragm and friction drive. A lobed wheel, driven by a flexible shaft, ran against a hardened steel button in the centre of the diaphragm. The resulting noise was diabolical, a deafening uproar of harsh metallic quality, unlike any other sound ever heard by man. As a warning signal it was a complete success: but it was too violent, and, besides, there was the troublesome friction wheel. bracket and flexible shaft to be specially installed.

Then the question arose: since power must be used, why not have an electric motor? The electric motor is far more efficient as a converter of current into work than any sort of electro magnetic buzzer, and it does not break the circuit several hundred times a second like the latter.

A miniature motor was made on the lines of best power practice. A toothed wheel was keyed on the shaft. Everything was made practically non-wearing, and suitable protection from water was added. A projector was made of such shape as to spread the sound waves laterally while sending them ahead. The completed apparatus, after many tests and refinements, was the Klaxon of today, not so loud as the flywheel Klaxon, but claimed by its inventor to be the most efficient converter of power into continuous noise.

The peculiar metallic note is said to be due to the diaphragm being very slightly buckled, like the bottom of an oil can. The amount of this buckling is very carefully regulated, and it results in each individual vibration having a sort of explosive crack. The motor runs at 3,000 r. p. m. on a 6 volt storage battery, and produces 500 complete vibrations per second. To resist breakage the diaphragm is specially rolled of chrome-vanadium steel.

### A Review of the 1909 Contest Season.

By M. Worth Colwell.

While opinions of manufacturers differ somewhat as to whether or not the game is worth the candle, the fact remains that contests, either of the speed or reliability variety, are instructive. While one manufacturer may not enter his own cars in contests, he nevertheless watches the points wherein his competitors in the industry fall down, and profits accordingly when he begins to design new models. A glance at the registration lists of a few of the larger States will show that it is the makers who enter contests, as a rule, who sell the most cars. Companies who maintain regular racing stables and keep their drivers on an active campaign throughout the country and advertise their product to a suitable extent find difficulty from time to time in supplying the demand for cars. A number of these companies have formed the Manufacturers' Contest Association, which on January I will take active control of all contests, speed and otherwise, having a working agreement with the contest board of the American Automobile Association, and from the calibre of the men representing leading manufacturers and importers in this association it is safe to assume that contests in 1910, and for some time to come, will be run on a safe and sane basis.

1909 has been a most satisfactory year, as far as contests are concerned, with the exception that it was a big disappointment not to have a second running of the Grand Prize race, and also that the Vanderbilt Cup race—what was to be the crowning event of 1909—was such an uninteresting contest. One or two road records were made during the year, notably that of 69.6 miles an hour by Louis Chevrolet at Riverhead, while track records galore were smashed. All the former marks for I mile tracks were broken. The year also produced a novelty in specially constructed motordromes at Indianapolis and Atlanta. Nothing like these had ever been attempted on this side of the water. Records flew at Indianapolis, only to be greatly reduced when the Atlanta opening came. Racing abroad amounted to little or nothing, owing principally to the fact that the French manufacturers formed a pact to kill the Grand Prix event—the great European classic. The foreigners felt that the game was too expensive.

#### NEW ORLEANS HAD FIRST EVENT.

Racing at New Orleans, La., began the contest season in this country on February 21, when at a three days' track meet Ralph De Palma, in the Fiat "Cyclone," monopolized the honors by winning seven events and setting up a new 10 mile record of 9:11 2-5, which he later beat materially at St. Paul. Robert Burman at the wheel of a Buick made a new 100 mile mark of 1:42:39 2-5. At this meet Mrs. Joan Newton Cuneo, in competition with all the crack

drivers, made a remarkable showing, winning several races. This, by the way, was her last public appearance in speed contests, owing to the decision of the A. A. A. barring women drivers.

The next month the annual Ormond-Daytona meet took place, and while there were but few entries a new world's straightaway mark was made. George Robertson, in Hugh McIntosh's 120 horse power Benz, was the start, breaking the 5 mile figure when he covered that distance in 2 minutes 45 1-5 seconds. David Bruce-Brown, in the same car, won the Sir Thomas Dewar trophy when he covered a mile in 33 seconds flat. De Palma set up a new 120 mile record of 1:33:44, and permanently won the Minneapolis trophy. The Daytona event, however, did not evoke the enthusiasm or draw the crowds that it did some four years ago

Owing to a disagreement among the members of the Briarcliff race committee regarding the size of cylinder, bore and stroke, there was no contest over the Westchester County course this year. In fact there was no spring race of importance except the Pacific Coast event at Santa Rosa, Cal., which Ben Noonan won in fast time in a Stoddard-Dayton.

#### NEW YORK-SEATTLE RACE.

That rather peculiar and somewhat lengthy and unpopular New York-Seattle race, which was run without the approval of the Manufacturers' Contest Association, although sanctioned by the Automobile Club of America, started on June 1, at New York, with only five entries. Eventually the affair wound up with a protested victory for the Ford, driven by W. B. Scott—a victory which was later awarded to the Shawmut entry after an investigation.

Numerous small track meets were held in the spring, among which was one which produced a new world's 25 mile record for mile tracks. This was at Readville, Mass., and De Palma was the record breaker, clipping Barney Oldfield's mark materially in 23:35—a mark which De Palma again broke in the fall.

#### THE WESTERN STOCK CHASSIS RACE

for the Cobe trophy was being looked forward to about this season. It was widely heralded in the newspapers, and a vigorous publicity campaign was engineered to centre interest in it. Sad to relate, the race held June 19 turned out a financial loss, and there is considerable doubt whether it will be held over the Crown Point-Lowell course in Indiana, under the auspices of the Chicago Automobile Club, again. The Cobe trophy was won by Louis Chevrolet in a Buick car at the slow average speed of 49.9 miles an hour. The late William Bourque, in a Knox, was second, and Robertson, in a Locomobile, third. This con-

test was most unsatisfactory, in that so many of the competitors broke down and dropped out long before the finish line was crossed. The light car contest for the Indiana trophy, held the previous day, resulted in a victory for Joe Matson, in a Chalmers-Detroit—the first good race this driver was fortunate enough to win. He was closely pushed for first place by George Robertson, in a 20 horse power Locomobile, at a 50 mile an hour clip.

A June road race that interested the people of Portland, Ore., was that for the Wemme Cup, which was captured by Bert Dingley, in a Chalmers, at a rate of nearly 60 miles an hour. Two of the light car classes in this contest were won by H. M. Covey, in a Cadillac, and C. Arnold, in a Pope-Hartford, respectively. A few days later another Western speed event was that on a road course in Denver, Col. A Colburn car was the first to cover the 290 miles, piloted by E. McMillan, at the very slow average of 33 miles an hour.

The first of a series of twenty-four hour races was run off at Brighton Beach on July 30-31, and was won by George Robertson and Al. Poole, in a 50 horse power Simplex, covering 1,091 miles, but failing to equal the record then held by Robertson in the same car. Louis Disbrow, in a Rainier, ran a good second.

#### INDIANAPOLIS SPEEDWAY INAUGURAL MEET.

In August came the inagural of the brand new Indianapolis Motor Speedway. It is to be greatly regretted that this initial meet should have been marred by several fatalities, for numerous new American records for a specially built 21/4 mile course were set up. It was the rough condition of the unfinished track surface rather than any radical fault with the banking or designing that caused turtling of cars. Three days of racing, beginning August 19, saw some remarkably fast time, among the best marks being Oldfield's mile in 43 1-10 seconds, a new American figure for the mile on that sort of a course. Louis Strang covered a fast 100 miles, winning the event in 1:32:48. E. A. Hearne, in a Fiat, won the 10 mile amateur championship in 9:44 3-10; Len Zengel made a new 10 mile mark of 8:23 1-5 with a Chadwick, and numerous other fast times were recorded, nearly all of which were exceeded in the fall at Atlanta. While many of these figures were announced at the time as being "world's" records, they were not by a long margin, for the figures came nowhere near the speeds made at Brooklands, England.

### LOWELL RACE.

When the National Stock Chassis Competition was run at Lowell, Mass., on September 6-8, the people who flocked to the Textile City saw one of the most exciting, hotly contested road races ever driven in a big car event. It was George Robert-

son at the wheel of a Simplex, that winning combination, who romped in to victory, covering the 318 miles in 5 hours 52 minutes, after the hardest sort of a fight, during which the seat of his car collapsed under this weight. The man to give him a stiff battle was Harry F. Grant, in an Alco, who had snatched the lead from big, husky George and lost out through a breaking chain in the last lap. Al. Poole, piloting an Isotta, scored second place, and E. H. Parker's Fiat was third. Robertson's triumph won for him the Lowell Trophy and a goodly sized package of coin of the realm. He declared that it was the hardest contest he had ever driven, owing to the rough sections on the back stretch of the course, which he was forced to negotiate at high speed in order to show.

On Labor Day, two days previously, the light car sweepstakes was run over the same course for the Vesper Club, Yorick Club and Merrimack Valley trophies. These three were won, respectively, by Robert Burman, Buick; Louis Chevrolet, Buick, and William Knipper, Chalmers-Detroit. On the intervening day, September 7. straightaway speed trials were held, Oldfield, in the Benz, proving the fastest in these, he having a far more powerful car than any of his competitors. These speed trials were not very exciting, but the meet as a whole, with the two long races, proved one of the best racing carnivals ever held on any road course.

#### RECORD BREAKING AT ST. PAUL.

Only a few days later, Ralph De Palma, in the "Cyclone," did a great streak of record breaking at two meets, held at Grand Rapids, Wis, and St. Paul, Minn. Ralph, previous to this time, held a number of marks for mile tracks between 1 and 26 miles, but on September 11 and 18 he shattered all of these materially, setting up a new mark of 50 4-5 seconds for the mile, which broke his own figure of :51 flat, made by him on the St. Paul course with the same car last year. Other amazing times he made were 10 miles in 8:49 3-5 and 25 miles in 22:59 3-5.

The same racing pilot drove to victory in the big car class in the Long Island Stock Car Derby, on September 29, carrying his 45 horse power Fiat over the 227 miles in 218 minutes. The contest was over a beautiful, smooth road course at Riverhead, promoted by "Senator" Morgan. A feature of this race was the speed made by Louis Chevrolet in a winning Buick in one of the light car classes, which was at an average of 69.6 miles an hour-a new American road record. Other respective classes in the lighter division were won by Frank Lescault, Palmer-Singer; W. H. Sharp, Sharp-Arrow, and Arthur See, Maxwell.

### NEW TWENTY-FOUR HOUR RECORD.

It was thought by many at the time Robinson made the world's 24 hour record for mile tracks, of 1,177 miles with the

Simplex last year, that this figure would stand for some time to come, but on October 21 last, at Brighton Beach, a Lozier car with Ralph Mulford and Cyrus Patschke driving, eclipsed the distance, rolling up 1,196 miles. Next season will see Robertson trying to break this mark and snatch the laurels once more.

#### FAST PORTOLA RACE.

The effete East does not hear a great deal about road and track contests in the Far West, but there was one on October 23 in California that deserves mention. Over the Portola circuit, in a sweepstakes race for 258 miles and under, Jack Fleming, in a Pope-Hartford, won the principal event, the free-for-all, skirting the above distance at a rate of 64 miles an hour, while in the same car he won his class over the required distance of 148 miles at the rate of 65.7 miles an hour, which is better time than was ever averaged in a Vanderbilt Cup race.

#### VANDERBILT CUP RACE.

As everyone knows, Harry F. Grant, in a six cylinder Alco, won the fifth Vanderbilt Cup race on October 30. Owing principally to the fact that so many of the starters met with mechanical trouble and accident, and the badly muddled scoring, the contest was not a great one. Throughout the race it was impossible at times to ascertain who was leading in the light car sweepstakes, while in the big car division an error in scoring nearly gave the victory to Parker in the Fiat. Parker, the only other contestant to finish, who was declared second, really thought he had won as he crossed the tape, and so did many of the spectators. Grant's average was 62.8 miles an hour, which was good time in view of the fact that the course was not a fast one. As for the small cars performance, most creditable showings were made by Ray Harroun in a Marmon, who won the Wheatley Hills Cup, and Joe Matson, in a Chalmers "30," who romped in first in his class, capturing the Massapequa trophy.

### ATLANTA SPEEDWAY OPENING.

When the Atlanta, Ga. motordrome was opened November 9-13, with a five days' racing carnival, it was an immense success. Thanks to the excellent management of the affair and the splendid condition of the two mile track there were no accidents, barring the burning of the old Pope-Toledo Vanderbilt Cup car. In fact the only criticism of the Atlanta course was that it was not banked as high at the turns as is Brooklands, England, and therefore the big cars could not take them at maximum speed and equal the time made abroad.

The feature of this opening meet was the shattering of all of the Indianapolis marks up to 200 miles, which was the longest distance run at Atlanta. The most spectacular and brilliant individual performance was that of Lewis Strang, in the 175 horse power Brooklands Fiat, formerly driven by Nazzaro, and holder of the world's record average speed. Strang

covered a mile in 37.7 seconds, outstripping Oldfield, Christie and others by a big margin. In fact Oldfield was so chagrined and disappointed at being beaten a couple of times by Strang, that he and Manager Bill Pickens packed up and departed for the cattle country of Texas.

Strang won five events with the big car at Atlanta, sweeping the boards clean for everything from one to ten mile distances. Robertson, in a stock Fiat, also won five events, notably 50 miles in 40:14, a new American mark. Various classes were won by Louis Disbrow, Rainier (notably the 200 mile event in 2:53:48); Chevrolet, who covered this distance in 2:46:48; while Harroun in a Marmon; Matson and Knipper, in Chalmers-Detroits, Aitkin in a National, and Nelson in a Buick, made excellent times and records in their classes. Atlanta furnished a fitting wind-up for an active racing year, which while disappointing in some respects was highly satisfactory in others.

Two new world's records were made at record trials held at the Indianapolis Speedway on December 17. Jack Aitkin in a National established a 20 mile stock car record of 16:18.41, and Lewis Strang in the 175 horse power Fiat a 5 mile record of 3:17.70.

#### TOURING CONTESTS.

As for touring and reliability contests this season manufacturers did not learn from them much that was new. Conducted along the lines of previous seasons, with nothing radically new, with the exception of more rigid technical examinations than before, there were numerous three days and one week runs of purely local interest in various parts of the country, the results of which are not of enough importance to mention. Among these were a three days' run in Pittsburg, Pa., early in April; the Quaker City Motor Club's endurance run and the Detroit Automobile Club's similar contest in the spring; also a few on the Pacific Coast. Three big tours, however. held this summer and fall, were noteworthy-the A. A. A. annual contest for the Glidden and Hower trophies, the Munsey tour and the New York-Atlanta tour.

The Glidden tour, July 12-30, starting from Detroit, Mich., and running westward as far as Denver and returning to Kansas City, Mo., where it wound up, was not as popular nor as well supported by the manufacturers as in the past. The route across the prairies led the contestants over some execrable roads, and it was anything but a comfortable excursion. The winner of the Glidden trophy was the Pierce-Arrow entry. driven by W. F. Winchester, who was the only contestant in the class credited with a perfect technical score, as well as perfect road score. Several contestants who pulled through the strenuous trip with perfect road tallies did not show clean technical slates, for when some of the technical committee started the work of examination, in which they banged spring leaves, nuts, etc, with wrenches, contestants found that this process loosened parts and caused penalizations. Another Pierce-Arrow car, driven by J. S. Williams, won the Hower trophy for the runabout class, while the Detroit trophy was won by a Chalmers-Detroit, piloted by Jean Bemb. No one save the winners seemed at all pleased with the tour. This, by the way, will go down in history as the last of the contests for the Glidden trophy, for it will be run no more.

A really good tour was the Munsey reliability contest from Washington, D. C., to Boston, Mass., and return, via Philadelphia, New York and Albany, September 21-29. Three dozen contestants started in this, the majority finishing with few penalizations. Only one perfect score, however, resulted. This was the Elmore contestant, driven by Frank Hardart, who was awarded the trophy. While promoted primarily as a publicity proposition for the Munsey newspapers in several of the cities visited, it served to awaken considerable interest at the capital and among dealers in the vicinity of the District of Columbia.

In much the same manner the New York-Atlanta tour, promoted by the New York Herald and the Atlanta Journal, October 25-November 5, awakened much interest in the South. Thanks to the efforts of the promoters a really good route from the metropolis to Georgia was laid out on what is known as the "National Highway." cars ran on a definite schedule, with a system of penalization for breaks and repairs, it was not so much an endurance run as a scheme to stimulate interest in road building and automobiles. Of the original thirty-five contestants, twenty-six-a large proportion-reached Atlanta with perfect scores. From this number it would have been hard to pick a single winner, for all of the cars were in good shape upon their arrival.

That other form of motoring competition-hill climbing—saw a few meets, the chief ones being at Wilkes-Barre, Pa., and Bridgeport, Conn., on May 31, and the Algonquin climb near Chicago in the summer. The unsatisfactory feature of hill climbing contests is that they are all necessarily local affairs, and no such thing as an American record or world's record is possible. Wilkes-Barre slope, "Giant's Despair," is perhaps the best example of a hill test for cars in the East. At the spring meet David Bruce-Brown covered the mile incline in 1:31 3-5, breaking the old record made by Willie Haupt in the Chadwick in 1908.

Taking it all in all, 1909 has been an active year in contests, and the prospects are that 1910 will be even more so.

### New Fifteen Mile Record.

Barney Oldfield, driving a 120 horse power Benz car, broke the world's speed record for 15 miles on a circular track at Ascot Park, Los Angeles, Cal., on December 26, lowering the time for the distance from 13:57 to 13:42 1-5. The former record was held by Ralph De Palma (Fiat).

### Crank Shaft Calculations and Construction.

### By Thor A. Waerner

We frequently hear the statements that mechanically the new automobile motors show little change in construction; that designers spend more time in standardizing and cheapening their construction than in efforts to add new features. As the majority of automobile manufacturers build motor cars to answer a certain price they are compelled to do so, but there will always be a market for those who fix the price to suit the best product.

Referring to crank shafts, we notice a departure from conventional design by the introduction of two bearing, four throw shafts. Several engineers have recently adopted this new type in cases where limited space and simplicity of construction are dominant factors. Some have even gone so far as to employ ball bearings for such crank shafts, but for the present, at least, most engineers have but little confidence in them.\* It seems safe, however, to state

readily be noticed by following the crank shaft calculations. Very much depends upon an even distribution of the deflections in the members of the crank shaft, so that shock may be least injurious to the bearings.

If it is not advisable to rely upon calculations for proportions of crank shafts, then we must face the same troubles that have been and are being experienced with numbers of crank shafts of conventional design. Why avoid careful calculations merely because practical examples are at hand to enable designers to build motors without having to bother with the slide rule? No data have been published for this new type of motor, consequently calculations are the only guide available. In making these calculations I have considered only the effects directly due to the thrust of the explosion, deeming it unnecessary to enter upon the problems arising from the effects of motion of the crank shaft. To make de-

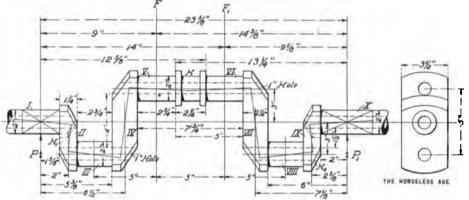

Fig. 1.

that for motors of very small bore and short stroke they may well be employed; they not only insure the ordinary advantages of ball bearings but reduce the size of the crank shaft considerably. This may

\*All of the two bearing, four throw crank shafts which have come under our observation are carried in ball bearings, and many engineers consider this essential on account of the localization of stress at the inner ends of the two bearings, if these are of the plain or parallel type, which, it is feared, would soon cause the crank shaft to break at these points.—ED.

ductions easier to the reader I shall consider a practical example. Fig. 1 represents a crank shaft for a four cylinder motor with a bore of 4 inches and a stroke of 5 inches, having plain bearings, with a longer one at the driving end. The initial pressure is taken as 250 pounds per square inch. The most important question is how much of a deflection of the crank shaft the main bearings will permit of. On the assumption that .003 inch is safe, the crank shaft proportions have been determined as follows:

Let 
$$D = \text{diameter of bearings.}$$
 $d = \text{diameter of hole in crank shaft.}$ 
 $h = \text{width of web.}$ 
 $b = \text{depth of web.}$ 
 $P = \text{reaction at left hand bearing.}$ 
 $P_1 = \text{reaction at right hand bearing.}$ 
 $F \text{ and } F_1 = \text{ultimate force at explosion in pounds per square inch.}$ 
 $E = \text{coefficient of elasticity} = 28,000,000.$ 

$$\frac{\pi}{64} \frac{(D^4 - d^4)}{64} = \text{moment of inertia, sections I, III, V, VI, VIII, X.}$$

$$\frac{b}{64} \frac{h^3}{12} = \text{moment of inertia, sections II, IV, VII, IX.}$$
For F and F<sub>1</sub> we have  $\frac{4^2\pi}{4} \times 250 = 3140.$ 
Considering F, we have for  $P = \frac{F \times 14\frac{5}{4}}{23\frac{5}{4}} = 1950$ ;  $P_1 = 1190.$ 

From the formula 
$$\frac{P \times W}{I \times E}$$
 we have for F :

Angularity at I, caused by deflection IV: 
$$\frac{P \times 6\frac{1}{8} \times 4}{\frac{b h^3}{12} \times E} = \frac{1950 \times 6\frac{1}{8} \times 4 \times 12}{3\frac{1}{8} \times 2\frac{1}{8} \times 28000000} = \frac{.00054''}{\frac{b h^3}{12} \times E}$$
Angularity at I, caused by deflection III: 
$$\frac{P(5\frac{1}{8} \times 2\frac{1}{8} - 2\frac{1}{8}^{3})}{\frac{\pi}{12} \times E} = \frac{1950 \times 5\frac{1}{8} \times 2\frac{1}{8} - 2\frac{1}{8}^{3})64}{\frac{1}{8} \times (2^4 - 1) \times 28000000} = \frac{.00061''}{\frac{b h^3}{12} \times E}$$
Angularity at I, caused by deflection II: 
$$\frac{P \times 2 \times 1\frac{1}{8}}{\frac{b h^3}{12} \times E} = \frac{1950 \times 2 \times 1\frac{1}{2} \times 12}{\frac{3\frac{1}{8} \times 1\frac{1}{8}^3 \times 28000000}{\frac{3\frac{1}{8} \times 1\frac{1}{8} \times 28000000}} = \frac{.00037''}{\frac{50000000}{12} \times \frac{3\frac{1}{8} \times 1\frac{1}{8} \times \frac{50}{8}}{\frac{50000000000}{12}} = \frac{.00013''}{12}$$
Total angularity at I, caused by deflections = I + II + III + IV =  $\frac{.00165''}{.00015''}$ 

Total angularity at I, caused by deflections = I + II + III + IV = 
$$\frac{.00165''}{0.0021''}$$

Angularity at X, caused by deflection VI:  $\frac{P_1(13\frac{1}{4} \times 5 - 5^2)}{\frac{\pi}{64} \times E} = \frac{.0021''}{64}$ 

Angularity at X, caused by deflection VII: 
$$\frac{P_1 \times .00054}{P} = \frac{.0003''}{P}$$
Angularity at X, caused by deflection VIII:  $\frac{P_1 \times .00061}{P} = \frac{.00037''}{P}$ 

Angularity at X, caused by deflection IX: 
$$\frac{P_1 \times .00037}{P} = .00019''$$

Angularity at X, caused by deflection X: 
$$\frac{P_1 \times 2}{\frac{\pi (D^4 - d^4)}{64} \times E} = \frac{.00011''}{}$$

Total angularity at X, caused by deflections  $VI + VIII + VIII + IX + X = \frac{.00307''}{}$ 

Considering 
$$F_1$$
, we have for  $P_1 = \frac{F_1 \times 14}{23\frac{1}{2}} = 1860$ ;  $P = 1280$ 

Angularity at X caused by deflection VII.  $\frac{P_1 \times 7\frac{1}{2} \times 4}{2} = 1860$ 

Angularity at X, caused by deflection VII: 
$$\frac{P_1 \times 7^{\frac{1}{2}} \times 4}{\frac{b h^3}{12} \times E} = \frac{.00057''}{12}$$

Angularity at X, caused by deflection VIII: 
$$\frac{P_1 \left(6 \times 2\frac{1}{4} - 2\frac{3}{4}\right)}{\frac{\pi \left(D^4 - d^4\right)}{64} \times E} = \frac{.0008''}{}$$

Angularity at X, caused by deflection IX: 
$$\frac{P_1 \times 2\frac{1}{5} \times 1\frac{1}{2}}{\frac{b h^3}{12} \times E} = .00046''$$

Angularity at X, caused by deflection X: 
$$\frac{P_1 \times 2}{\frac{\pi (D^4 - d^4)}{64} \times E} = \frac{.00018''}{.00018''}$$

Total angularity at X, caused by deflections = VII + VIII + IX + X = 
$$\frac{.002''}{}$$

Angularity at I, caused by deflection V: 
$$\frac{P(12\frac{5}{4} \times 5 - 5^2)}{\frac{\pi(D^4 - d^4)}{64} \times E} = \frac{.00175''}{.00175''}$$

Angularity at I, caused by deflection IV: 
$$\frac{P \times .00057}{P_1} = \underline{.00039''}$$

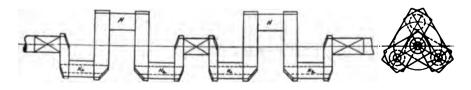

Angularity at I, caused by deflection III: 
$$\frac{P \times .0008}{P_1} = .00055''$$

Angularity at I, caused by deflection II: 
$$\frac{P \times .00046}{P_1} = .00031''$$

Angularity at I, caused by deflection I: 
$$\frac{P \times I_{k}^{B}}{\frac{\pi}{64}} = \frac{.00008''}{.00008''}$$

Total angularity at I caused by deflections: I + II + III + IV + V = .00318''

It will be noticed that supports have been considered in the centre of the bearings; less conservative designers may consider them close to Parts II and IX, thus eliminating Parts I and X from the calculation. The term angularity is used above to represent the displacement of point I.

By making section H proportionate with sections H1+H2 the crank shaft may be perfectly balanced. Shearing and twisting moments should not be ignored, but in a shaft of this type it is evident that they are of secondary importance. As the metal around the axis of rotation is of little value, the extreme fibre, remote from the axis, doing nearly all of the work, the shaft is lightened considerably by making it hollow.

Fig. 2 represents a crank shaft for six cylinder motors. One may conceive the neatness of construction of "sixes" having only three main bearings, three cylinders cast together, with inlet and exhaust manifolds integral with the casting. A shaft of this type will not be so cumbersome as the one in Fig. 1 may appear to be, and may also be perfectly well balanced by making H solid and drilling H1 and H2 to suit.

### Report of Ohio Automobile Department.

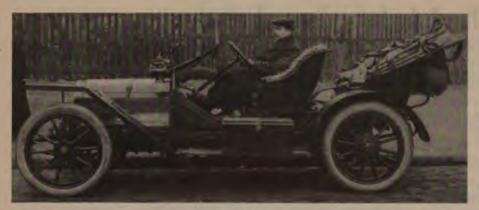

State Registrar of Automobiles Fred H. Caley has made public an interesting report covering the work of the Ohio State Automobile Department for the year 1909. The report shows that 23,000 motor cars of every description were registered for operation within the borders of the Buckeye State, which is considered a large number when the condition of Ohio roads is taken into consideration. Practically all motor cars in the State have been registered, and there are only a few cases where the owners evaded the law.

Cuyahoga County, which includes the city of Cleveland, is the banner county of the State, as far as the number of motor cars is concerned. In all 5,301 cars were registered from that county. Hamilton County, containing Cincinnati, is second with 1,539 cars, while Franklin County, which includes Columbus, is third with 1,357 cars. Lucas County, including Toledo, is fourth with 1,088 cars, and Montgomery County is fifth with 1,047 registrations.

In all 70 cars were registered with the State Department from owners living outside of the State for operation in Ohio. Indiana had 3 such owners and Kentucky 28; Arizona had I; Canada, 3; Florida, I; Delaware, 1; Colorado, 1; Maryland, 3; Michigan, 3; New Jersey, 4; New York, 8; Missouri, 1; Pennsylvania, 4; Rhode Island, 2; Texas 1, and West Virginia, 6.

The question of roads has considerable to do with the number of motor cars operated within certain areas. In Hamilton County, which contains fully a half million people, only 1,539 cars were registered, while the number registered from Cuyahoga County is almost four times that number. The reason is the hilly and stony roads around Cincinnati.

State Registrar Fred H. Caley has sent out a circular letter to all auto owners in the State, calling attention to the fact that they must secure 1910 tags by the first of the new year.

GREGOIRE CAR.

were thus required to cover almost 2,000 miles within a fortnight, which included roads of all kinds and grades of considerable steepness.

The contest was favored by pleasant weather throughout. On the first day the roads were rather greasy, owing to the fact that a week of rain had preceded the start of the contest. Nevertheless, all of the twenty-nine competing vehicles completed the run within the prescribed time limit of 7 hours 26 minutes, but three—the Barre-Niort, No. 13, driven by Ravaud, and the Doriot-Flandrins, Nos. 16 and 18, driven by Rivat and Godefroy, respectively—were penalized on account of mechanical troubles. The cause of penalization of the Barrie-Niort is said to have been nothing more serious than the breaking of the fan belt.

Up to Friday, December 10, eight of the twenty-nine contesting cars had received penalizations, and therefore lost their chance of being "classed." Considerable bad feeling was aroused among the contestants as the result of the very severe interpretation of the contest rules. Thus, for instance, the friction driven Turicum car, a Swiss product, was penalized because its driver had tightened a bolt securing the leather to the friction disc. The entrant protested against this penalization, and the contest committee eventually rescinded it.

The penalization of the Doriot-Flandrin No. 16, on account of the tightening of the inlet valve bolts, was temporarily suspended, pending further consideration by the committee. On Tuesday the Doriot-Flandrin No. 17, driven by Deschamps, arrived late at the end control, and decided to withdraw. The run on Wednesday, over the route Paris-Beauvais and back, brought the downfall of three further vehicles. The Turicum No. 23 was penalized for repairs to the brake lever; Barre-Niort No. 13 had a collision with No. 14 of the same make and suffered damage to its radiator, and Zenith No. 28 did not complete the run for some unknown reason.

On Tuesday, December 14, after ten of the fifteen stages had been completed, there were still seventeen competing vehicles with perfect scores, and it was then hoped that if the weather continued as good as it had been so far practically all of these would finish and be classed. The list of perfect score cars at this stage of the trial was as follows;

Sizaire-Naudin, Nos. 2 and 3; Gregoire, Nos. 5 and 6; Delage, No. 7; Hartu, No. 10; Barre-Niort, No. 15; Doriot-Flandrin, No. 16; Corre-La Licorne, Nos. 19 and 21; Turicum, No. 22; Alcyon, Nos. 25, 26 and 27; Demeester, No. 29, and Rolland-

Pilain, Nos. 30 and 31. There had withdrawn from the contest the following: Sizaire-Naudin, No. 1; Fouillaron, No. 12; Barre-Niort, No. 14; Doriot-Flandrin, No. 17; Corre-La Licorne, No. 20; Zenith, No. 28, and Rolland-Pilain, No. 32. The following cars continued with penalizations: Doriot-Flandrin, No. 18; Gregoire, No. 4; Barre-Niort, No. 13; Hurtu, No. 11, and Turicum, No. 23.

### Particulars of the Daimler-Megevet Cellular Radiator Patent Infringement Suit.

We have already given the verdict reached in the above case by the Swiss Federal Court, by which damages in excess of 300-000 francs were awarded the complainants. the Daimler Motor Company, An authorized representative of the Daimler Company. named Maemecke, applied for a patent in Switzerland on the so called cellular radiator-a proceeding often followed by well known manufacturers in order that the patent may attract less attention. This invention was imitated by the defendant Megevet on a large scale in 1902 by manufacturing, both in Geneva, Switzerland, and in Bellegarde, France, radiators on this system, and selling them everywhere. It was determined that from July, 1906, he sold from both factories 300 coolers per month, and in July. 1907, there were delivered from Geneva no less than 7,219, and from Bellegarde 2,630. As early as 1904 the complainant company. to whom the Maemecke patent had meanwhile been transferred, notified the Genera firm of its infringement of the patent, and ordered it to desist, but without success. Then they brought suit in the Geneva courts, asking for the award of damages and the destruction of the infringing tools. First these courts bluntly rejected the suit because the person named in the patent application, Maemecke, was neither the inventor nor his legal successor; it was, on the contrary, admitted that the complainants were the inventors. However, the patent application was not in their name, nor did

DORIOT-FLANDRIN TEN HORSE POWER MOTOR

FOUR CYLINDER, TWELVE-SIXTEEN HORSE POWER CORRE-LA LICONAL

they transfer the rights to the invention to Maemecke.

This decision was, however, revoked by the Swiss Federal Court, which returned the case to the Geneva courts for the decision of the other questions involved. The patent, they held, could not be overthrown because the formerly registered owner was not the inventor. Besides, Maemecke had his name inserted at the request of the inventor. For this reason the patent could not be considered as brought into his possession by illegitimate means.

Thereupon, the Geneva courts took the patent up for the second time, and this time they gave a verdict for 70,000 francs that defendant made the radiators slightly different from complainants', and also obtained a Swiss patent for this method of construction. According to the testimony of experts, the arrangement of the cooler tubes is the same, and the deviations are altogether of a secondary nature. The objection of defendant that the patent of complainants had become invalid because it was not manufactured, complainants manufacturing according to the German patent, which differed in one essential point from the Swiss patent (which was not admitted by the experts), was also declared void. Besides the defendant in the course of the proceedings had himself alluded to the

FRENCH LIGHT CAR TRIALS-DORIOT-FLANDRIN CAR.

against the copyist. This decision was appealed from to the Federal Court by both parties, complainants demanding greater damages and defendant rejection of the verdict and a new expert investigation. The Federal Court, as is known, rendered a verdice for 300,000 francs damages and costs against defendant, and ordered publication of the verdict at the expense of defendant on the following grounds:

The objection of defendant that the invention was not new at the time of the application for patent in Switzerland is not substantiated. Even if it were true that shortly before the filing of the application a Mercedes automobile, with a cellular radiator, was driven in Switzerland, the novelty of the invention would still be unaffected, for the complainants had filed a patent application in Germany, and, according to a German-Swiss patent treaty, an inventor who has filed his application in Germany enjoys the advantage of priority rights in Switzerland if he files his application in the latter country inside of three months from the date of issue of his German patent, which was the case here.

The assertion of defendant that he had made arrangements before application for patent was made in Switzerland to manufacture a similar cooler also is of no weight, as these preparations fell in the time after the application for the German patent. The imitation is quite obvious, notwithstanding

identity of the German and Swiss patents. The last rejoinder was also void, namely that the radiators of the Daimler Company did not bear the Swiss patent mark (Helvetian Cross). German patents are immune from this requirement under certain conditions applying in this case, under the terms of the patent treaty.

The Geneva courts set down the indemnity to be paid at 5 francs per radiator, while defendant earned an average of 57.80 francs per radiator, on the ground that complainants do not manufacture radiators to sell them as such, but would have used them on their own automobiles. It was, however, not proven that complainants sold fewer automobiles in consequence of the imitation of defendant. The Federal Court, however, held the opinion that defendant would have to give up the entire profits derived from the imitation, even if complainants, by reason of a different method of exploitation, had not secured these same profits. However, defendant is not required to give up the entire profits derived from the manufacture of the apparatus, but only that portion of the profits which depends upon the invention.

In this connection it is to be kept in mind that defendant without the imitation would have built radiators according to some other system, and the profits he would have made at that should be left him. He, therefore,

has to pay such an amount as would have been named by experts as a fair royalty if complainants had been forced to give a license. This amount is set down at 20-25 francs by the Federal Court. This gives for the total of radiators manufactured up to July, 1909, approximately, 300,000 francs, inclusive of the 7,000 francs allowed by the lower court for costs. Complainants had asked for more than 7,000,000 francs damages, based not upon the average price of 266 francs obtained by defendant, but upon the very much higher prices secured by themselves. The court, however, was of the opinion that the enormous sales of defendant were the result of his low price, and that no higher price could be considered if the total number of radiators sold was taken for the basis of the amount of damages. Besides, only the radiators manufactured in Geneva were taken into account. It is true that the coolers manufactured in Bellegarde, France, were sold from Geneva, but they were never brought into Swiss territory, as they were shipped direct from the factory. Even though not only the manufacture but also the sale of patented objects is forbidden, the infringing effects of sales must be apparent within the country. If the article is not covered by patent in some foreign country to which it is shipped, it is impossible to forbid and impose a pena'ty on the sale effected within the country. This would lead to international conflicts. This conforms to German practice and views, while, on the other hand, French courts have rendered decisions to the contrary. A minority of the Federal judges was ready to apply the French ruling and raise the damages to be awarded to complainants to half a million francs-Automobil Welt.

The City Council of Hamburg, Germany, recently made an appropriation of 95,000 marks for the acquisition of a second electrically propelled fire train (motor fire engine, hose and ladder wagon, etc.).

The technical committee appointed in connection with the Swiss trials of speed indicators, which were organized by the Swiss Federal Government with the object of making the fitting of such indicators obligatory, has made its report to the Department of the Interior. The labors of the committee began on July 10.

An automobile faction has been formed in the French Chamber of Deputies, which about forty deputies of all shades of political opinion immediately joined. The new combine will fight the proposed increase in automobile taxes. The president of the new organization is Georges Berry, and the vice presidents are Marquis de Dion and Deputy Willm.

### DESCRIPTIONS OF NEW VEHICLES AND PARTS.

#### The 1010 Cartercar.

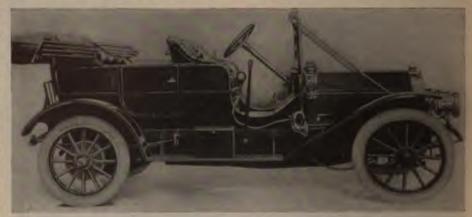

Considerable change will be noticed in the Cartercar models for 1910, manufactured by the Cartercar Company, of Pontiac, Mich., over those shown during the season of 1909. The most perceptible change is from a two cylinder motor in last season's product to a four cylinder chassis and one entirely new model of chassis. The cars are larger than have been produced in the past, having more power, and the prices are somewhat higher. The line consists of a Model L five passenger touring car and a Model H runabout with interchangeable bodies.

A new feature is a transmission driver. This arrangement does away with all adjustments, lubrication or possibility of wear. The friction disc is larger this year, while the friction fibre is made in three separate pieces, and does not require tearing down the transmission when it is to be replaced. The Model H has a plain deck at the rear on which can be placed a rumble box, a single rumble seat, a double surrey seat or a miniature tonneau, at the will of the owner. This car has a wheel base of 100 inches, while Model L has a wheel base of 110 inches. Model L chassis can also be equipped as a taxicab.

The water for cooling the Model L motor is circulated by means of a gear driven centrifugal pump located on the left hand side of the motor, while circulation in Model H motor is by the thermo-siphon system. The cylinders of both motors are cast from gray iron in pairs, with the valves all on one side and actuated by a single cam shaft. The water jackets in all are long and increase slightly at the top to permit a larger volume of water to surround the cylinder heads. In each instance the water outlet is from the centre at the top

and between the cylinders of each pair. The water in Model L motor is, however, carried from the pump on the left side of the motor through between the two pairs of cylinder castings in a brass water pipe, and enters the water jackets just below the valve seats, midway between the cylinders of each set.

Since only the motors of the two chasses differ materially, and the common bracket for tightening the driving belt. The pump shaft is driven through an idler gear from the crank shaft gear. The crank shaft is drop forged from open hearth sted, and has three main bearings, all of which are contained in the upper portion of the crank case. On the rear left hand motor hanger arm is a capped pipe, which serves the double purpose of crank case compression relief pipe and oil filler tube. The

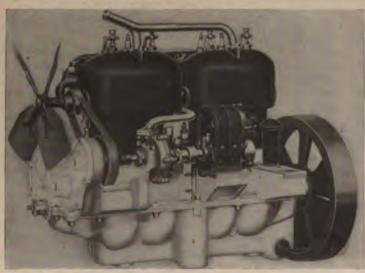

CARTERCAR MODEL "L," FIVE PASSENGER TOURING CAR.

points of both have been described in part above, the points wherein they differ will be taken up separately and both chasses otherwise described as one.

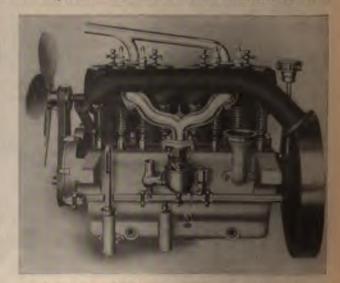

Model L motor has a 4¼ inch bore and 4½ inch stroke, producing 30 horse power. Cylinders and pistons are ground to size. Care is taken to insure the positive alignment of the crank shaft and cam shaft, and all moving parts are ground. The centrifugal pump and magneto are both gear driven by the same jointed shaft, which is also provided with a pulley for driving the air circulating fan by means of a flat belt. The fan stud is located in an adjustable

lower portion of the crank case has the splash basins cast spherical, so that the oil cannot run away from the dip of the connecting rods when climbing a grade.

The lubrication of Models L and H is by the combined pump and splash system. A quantity of oil is carried in a well or reservoir at the base of the crank case, and a bath of oil in the crank case itself, into which the connecting rods dip. The oil in the splash basins is constantly renewed by the pump from the supply in the oil well beneath, the surplus oil draining off through the overflow pipes, thus maintaining a fixed level of oil. The carburetors are of the

LEFT SIDE OF MODEL "L," THIRTY-THIRTY-FIVE HORSE POWER

LEFT SIDE OF MODEL "H," TWENTY-FIVE HOUSE POWER
MOTOR.

ral float feed type, and are self adjustafter once being set.

dual system of ignition is employed, isting of a low tension, direct driven neto and an auxiliary battery, carried netal box on the running board. The neto current, as well as the battery ent, is transformed by means of a tenon-vibrating coil carried on the

le Cartercar transmission consists of a all alloy disc on the end of a shaft ected with the flywheel. Against this bears a sliding friction wheel, with a rim, which can be moved to any point he surface from the centre to the circerence, thus giving any speed desired. neans of sprockets and a chain this tershaft is connected with the rear

TRANSMISSION THRUST BEARING.

Speed changes are made by means hand lever, this single lever giving ariations of speed from the lowest to highest, and also the reverse. After lever has been placed in the desired ion the friction disc and wheel are ght into contact by means of the left, this motion corresponding to the open of a clutch pedal in connection with ag gear transmissions. The moving of the transmission are lubricated by so of three screw grease cups.

e transmission shafts are mounted on

TRANSMISSION DRIVER.

high duty ball bearings. The thrust bearing of the disc shaft is carried in a hanger immediately in front of the disc, and is of the four point type. The bearings at both ends of the cross shaft are annular ball, with double cups and sleeves, and two rows of balls. These bearings are carried in adjustable hangers, which are bolted rigidly to the side channels of the frame. Both the disc shaft and cross shaft are turned and ground to size.

The transmission "driver," which transmits power from the engine, is of a new pattern, and greatly improved over that formerly employed. This driver consists of a cross member keyed rigidly to the forward end of the disc shaft, to which are secured two flat tempered steel plates, the opposite ends of which are bolted to the flywheel itself. The rotation of the flywheel exerts a straight pull on these plates, thus rotating the disc, and at the same time the disc and shaft are free to slide forward and back without restraint.

The pedals are of a new design, giving a much freer and easier action, together with a more comfortable position for the feet. The ratchets are positive and are operated by the slightest touch. Brakes of a new design are used, and the brake drums have been increased to a diameter of 14 inches. The reverse of the friction wheel acts as a powerful emergency brake.

The drive chain is encased in a cast metal oil tight casing, permitting the chain to run in a continual bath of oil, and protected from dirt and water. The rear axle is of the tubular, divided type, and strongly trussed. The differential is of spur gear type. The axle shafts are of special steel, and carried on Hyatt roller bearings. The front axle is tubular, of new drop pattern. The yokes and knuckles are of a new style and increased in size over last year, while ball bearings are used in the wheels.

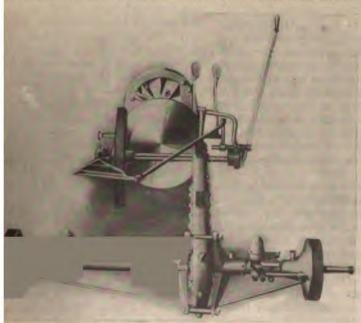

The frame is hot riveted and made from

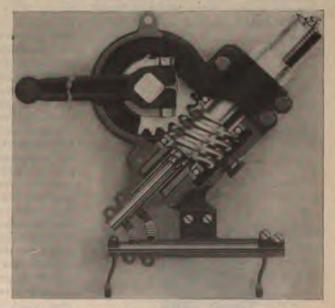

CROSS SHAFT BEARING.

cold pressed nickel steel of channel section. The steering gear is worm and sector. Adjustment is provided so that all backlash or lost motion can be taken up, there being ball thrust bearings above and below the worm.

The motor in Model H has a 4 inch bore and 4 inch stroke, and differs from that of Model L in that it has the thermo-siphon system of cooling instead of pump circulation. Semi-elliptic springs are used all around, those on Model L being 46 inches long in front and 52 inches long at the rear, and those on Model H 38 inches and 45 inches, respectively.

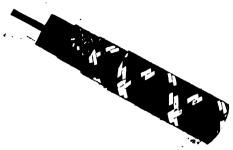

FRICTION TRANSMISSION AND CHAIN-IN-OIL DRIVE

STEERING GEAR, SHOWING WORM AND SECTOR, WITH PROVISION FOR ADJUSTMENT.

#### Diamond Ignition Cable.

In connection with their line of auto tires and accessories, the Diamond Rubber Company, of Akron, Ohio, are now marketing a complete line of ignition cables. Their Class A three-eighth inch secondary cable consists of thirty-seven strands of No. 30 B & S gauge copper wires, which are insulated

with a high grade rubber compound, which is covered with a black glazed braid. It is stated that this cable has been used successfully by several manufacturers for some years. H. J. Woodard is manager of the company's insulated wire and cable department, which manufactures the ignition cable.

#### The Clark Lock Nut.

The lock nut herewith illustrated is made by the Interlocking Nut and Bolt Company, of Pittsburg, and is claimed to be applicable to automobile work. The use of this lock nut requires that the necessary length of the bolt be definitely ascertained, so the end of the bolt will come flush with the outside of the nut when the latter is drawn up tight. The end of the bolt having been slotted to a proper depth, a specially designed chisel is inserted, and the threads of the bolt are forced into the threads of the nut. At the same instant an overreaching jaw of the chisel attacks the nut and forces a portion of the nut into the slot in the bolt, thus interlocking, first the bolt into the nut and then a portion of the nut into the bolt.

CLARK LOCK NUT AND CHISEL

It is claimed for this lock nut that it is absolutely positive, that it can be removed with an ordinary wrench with a slight extra pressure, and that it can be replaced and locked again as firmly as in the first instance.

### The Michelin Anti-Skid Tires.

The Michelin anti-skid tire was invented, patented and first marketed by Michelin in 1905. It was in that year, just before the last Gordon Bennett Cup race, that the late Leon Thery, one of the world's most famous drivers and winner of that great motoring classic, introduced Michelin anti-skid tires. As a matter of fact, the first four cars to finish on that notable occasion were equipped with Michelins.

The tread of the Michelin anti-skid and the wearing surfaces of the side walls are protected by a tough but flexible oxhide band, which is an integral part of the tire and not an attachment, and in this are imbedded from three to five rows of hardened steel rivets or studs. The Michelin Company do not indorse the various detachable anti-skid devices now on the market, which

MICHELIN ANTI-SKID TIRE.

are claimed to be injurious to the rubber envelope and to destroy its flexibility.

In the Michelin construction the full resiliency of the tire is claimed to be preserved, because the lower side wall, or that part immediately above the beads, is of rubber, which permits the tire to absorb all shocks and jars, the same as any other good pneumatic tire. At the same time the oxhide leather band protects the tread from cuts and punctures, which prolongs the life of the envelope.

Michelin anti-skids are made in both American and metric sizes, and are guaranteed by the manufacturers for use on clincher rims and on all well known quick detachable rims of standard dimensions designed for clincher type tires.

It is stated in a circular issued recently that the danger of skidding is greatest when traveling over Belgian block, brick or asphalt, which is particularly slippery after a light rain, and that anti-skid tires of the type described practically eliminate this dan-

gerous tendency. It is pointed out that Chevrolet used Michelin anti-skids when he averaged 70 miles an hour with his Buick car in the Riverhead-Mattituck race on Long Island in September.

### Staggering Tire Expense of London Taxicabs.

By Roy LINDSAY.

Some two years ago the writer, when giving an account of the then position of the taxicab business in England, referred to a prospectus issued by the General Motor Cab Company, Ltd., asking for greatly increased capital requirements from the public, wherein very rosy statements were made respecting the certainty of enormous net profits being earned. The section of the prospectus which was particularly criticised was that in relation to the cost of pneumatic tires. The public were told that a very satisfactory contract was running for the supply of new tires and the renovation of old ones, but they were not informed that this contract had but six months to run and that it had been made with a large French house who had also helped to finance the original flotation.

At the annual meeting of the General Motor Cab Company, Ltd., held a few days ago in London, the chairman announced that, with an average number of 1,180 cabs in service for the twelve months covered by the accounts, the cost of renewals and repairs only of pneumatic tires had reached the huge sum of \$520,000. In consequence. while the preferred shareholders would receive their 7 per cent., the ordinary shareholders would get nothing. Further, as it was hoped to have 1,800 cabs in service daily during 1910, tire renewals would possibly figure at \$1,000,000 in the next year's account! This was cold comfort for the shareholders, who were calmly notified that the directors, after mature consideration. were convinced that permanent success could only be looked for in the evolution of taxicabs built specially to travel upon solid tires. The gentleman who made this remark also said that the initial cost of all the cabs was being written off at the rate of 161/2 per cent. per annum.

A committee has been organized in Paris, on the initiative of Marquis De Dion, which occupies itself with the organization of a great race for the season of 1910, to take the place of the Grand Prix abandoned by the A. C. of France. Much criticism is being heaped upon the club, and one publication demands the closing by the police of the "gambling den of the Place de la Concorde."

It is rumored that the tax free importation of petroleum and gasoline into Austria may soon come to an end, and the Austrian A. C. has addressed a petition to the Minister of Finance protesting against this proposed move in the name of all of the Austrian automobile clubs and associations.

### COMMENTS AND QUERIES OF READERS.

### Mathematical Articles-The Other Side.

Editor Horseless Age:

In the December 15 issue of your valuable paper you gave some space to a few readers who seem to be in favor of your publishing mathematical articles, and I would ask you to note what a man has to say who does not care much to read them all the while. I believe these gentlemen will understand that their protest was altogether too one sided.

I have been a subscriber to your journal from 1899 to the present, and it was not at all to my liking to have served out to me so many purely mathematical articles. Of course, I know your valuable paper is mostly intended for the trade, and such amateurs as are trying to work in a small way or experimenting, but you surely have a good many subscribers who like myself want to hear something about the upkeep of autos and the progress in construction of machines. Even if you give descriptions of new models of different makes, you don't often report really new points. For instance, there seems to be a giving up of mechanical oilers, which are replaced by an engine driven crank case pump. You never mentioned this at length, except in one or two articles about new models, and then in the briefest possible way. Now that's just one point out of many.

What I object to is illustrated by the following. I do not remember ever having seen anything about the following questions, important to an auto owner: How to care for auto tops, to keep them in good shape and keep the canvas or leather from crack-You wrote about tires, how much load they ought to carry, but never or seldom discuss how to repair them nor give hints that will come handy to those who have small vulcanizers (the article in the December 15 issue is by far too vague to be of much value). How can an owner keep a magneto in good shape? How should he care for spark plugs, and find if they are short circuiting; this latter surely is a puzzling trouble to a good many owners. How about misfiring? What's the best way to keep down the noise of slightly worn gears? How to make over wheels with clincher tire outfit so they will take quick detachable rims and yet use the old clincher shoes?

I have had a steamer (bought in 1899), an air cooler, a one cylinder water cooler and a four cylinder water cooler, and always tried to keep them in repair myself. I also did it after a fashion, even in those days when you could not stop in the street anywhere without drawing a crowd and being asked continually "Did you break down?" My autos were always smoothly running along.

Now in conclusion I want to say I don't write you this letter to advise you how to run your paper, but only to show you what one class of people want and are looking for. Surely nobody would expect you to print mathematical articles to the exclusion of everything else, or give all your space to steamers or electrics (which you are not doing), while steamers and electrics are made and sold yet.

PH. F. STEPHANI.

### Varying the Peak of the Current Wave to Correspond With the Time of the Spark.

Editor Horseless Age:

Referring to the letter of Henry Hess on "Magneto Ignition of Motors at Slow Speeds," I notice that he mentions only the magneto which he represents in the United States as giving a full spark at any point of the position of the armature. There are quite a number of machines on the market of the indirectly driven type; that is, those with armatures not rigidly fixed to the driving contrivance, which are similar in principle to the Taunus make of Frankfort handled by Mr. Hess.

As Mr. Hess does not state the make of machines he tested, nor mention the year, type, etc., his disclosures of tests, by giving simply the number of machines, are of little value, and simply serve to draw attention to his particular pattern. If Mr. Hess will test a latest pattern Bosch, Unterberg, Simms, Fein, Eisemann, Nieuport, Nilmelior, etc., he will find that the spark generated is quite good for all reasonable speeds, and this can be ascertained without the trouble of fancy tests.

If any experiments of a thorough character had been made it would have been wise to measure the end thrust of the armature of any other machine shifting the armature during its working, and thus give data which would be of value to all, inventors and manufacturers alike.

A short description of magnetos with armatures giving a spark of maximum volume, no matter how the ignition is timed, may be of some interest.

The Eisemann Company were the first to adopt this principle, after an Englishman had dropped the invention. The Eisemann magneto had a screw on the spindle and a sleeve with an outside attachment; in this way the armature while running could be brought to the "peak" position at any time. The company also made a machine with magnets movable around the armature.

Breguet had a sleeve between the pole pieces and the armature.

Pianoli moved his armature similarly to Eisemann.

Bosch had a similar device.

Bullock moves his magnets around the armature,

Remy, New Witherbee, another Indianapolis company, and Starker, a German firm, advance the armature instead of the contact breaker.

Muirhead, Thompson and Taunus use a differential device.

Splitdorf has lately applied for a patent on a device similar to the Eisemann arrangement, and promises great things.

FRED I. HOFFMAN.

### Front Wheel Brakes.

Editor Horseless Age:

Will you permit me to supplement what your London correspondent says regarding "front wheel brakes" at the London Show?

The exhibition of front wheel brakes on standard and well known cars was one of the great features of the show, and drew the most intelligent and, aside from a few vaudeville features, the largest crowds of the show. The passing of transmission brakes was also rather a marked feature of the show. Few, except cheap cars and off makes, had transmission brakes. Double brakes on each rear wheel were the rule among the best cars.

Front wheel brakes, by the way, are more efficient than rear wheel brakes, because in going down hill or in sudden stops the weight of the car piles up on the front wheels and gives their tires, therefore, more friction than is possible with rear wheels under these circumstances. For precisely these reasons rear wheels are more efficient for driving when starting or when climbing steep hills. Rear wheel drives and front wheel brakes give the ideal condition for starting and stopping.

Front wheel brakes not only almost absolutely prevent skidding but will correct skidding when begun by the action of rear wheel brakes.

I have no interest in the matter beyond that of the ordinary car user. H

### Typographical Error Corrected.

Editor Horseless Age:

In the reproduction of my short note about cold weather starting, which you were kind enough to print, you omitted the minus sign before the 30, which was highly essential to the context, and very much weakened the force of the article.

H. M. WHEELER.

[We noticed the omission of the minus sign only after the paper was out.—En.]

### Injunction Against E-M-F Company Denied

Two suits were brought by the Studebaker interests last week to restrain the E-M-F Company from repudiating the exclusive distributing agency contract between the two firms. The Studebakers first applied for an injunction from Judge Swan restraining the E-M-F Company from selling its output to any company other than the Studebaker Automobile Company. The hearing of the bill is to come up in Detroit on Monday, January 3. At the same time Frederick S. Fish, Clement Studebaker, Jr., and Hayden Eames, the Studebaker stockholders, who bought out the interests of W. E. Metzger, B. F. Everitt and William Kelly in the E-M-F Company, as minority stockholders in the Detroit concern, appealed to Judge Henry F. Severens at Cincinnati to have the repudiation of the Studebaker contract by the E-M-F Company declared null and void because they, as directors of the local company, were not consulted in the act.

The documents filed in evidence in the above two cases throw some interesting side lights on the events which led up to the rupture. From the exhibits attached to one bill it appears that Messrs. Everitt and Metzger were led to dispose of their stock in the E-M-F Company by disagreements with Walter Flanders, as to the selling policy to be pursued. Mr. Flanders in a letter to the stockholders urged them to take advantage of the selling organization of the Studebaker Company for the marketing of E-M-F products, and cited a profit of \$30,-000 from the old Wayne Company and a profit of \$50,000 from the purchase of the Northern Motor Car Company, both of which were made profitable through his offices, as reasons why the E-M-F directors should take his advice in the matter of the selling policy.

Subsequently a contract with the Stude-bakers became operative August 5, 1908. following the acquisition of 36,741 shares of E-M-F stock by Fish, Studebaker and Eames. This contract was continued in April, 1909, and was renewed from September I, 1909. The contract provides that the Studebakers were to market the entire output of the E-M-F Company, taking the cars at an average rate of 1,000 a month at the rate of \$900 per car for E-M-F "Thirties," which rate, according to one of the exhibits, allowed the E-M-F Company a profit of \$150 a car.

The answer of the E-M-F Company, after citing the various reasons which prompted the company to annul the selling contract with the Studebakers, that have already been published, goes on to show that the Studebaker Company is not a manufacturing company but a sales concern, with a capital of \$100,000, while the E-M-F Company has an investment of \$2.582,681 in its six plants, and that it has contracts for material with sixty firms, aggregating \$5,000,000. It is disclosed by the answer that

the contracts made by the company for parts and materials are based upon the cost plus a fixed percentage of profit, so that all these firms would be affected if the factory should be closed.

Judge Severens, of the United States Circuit Court at Kalamazoo, Mich., granted the restraining order asked for, but on December 24, after hearing the testimony of both sides on the two previous days, he denied the motion for an injunction. The judge's decision reads as follows:

"Upon this motion for a preliminary injunction it is to be observed:

"First-That the complainants are stockholders and that they do not sue in their own right, but found their proceeding upon an apprehended injury to the corporation in which they are stockholders. They are permitted by the rules and practice of equity to do this in a case where the board of directors, which is the normal agency of the corporation for the prosecution of suits for remedies to secure a right of or prevent an injury to the corporation, is directly charged with responsibility for the wrong or injury done or threatened to the corporation. This is a necessary expedient because of the attitule of the board of directors. Otherwise, the corporation would be unable to relieve itself. In such cases the stockholders are the agency by which the corporation gains access to the court, and its interests are supposed to be in friendly hands.

"This suit, then, is practically one involving a controversy between the Everitt Metzger-Flanders Company and its board of directors—or rather, having reference to the particular facts, the majority of the board of directors—who are charged with misconduct.

"Upon this alignment of parties a suggestion of difficulty is presented as to whether the requisite diversity of citizenship to found the jurisdiction of the court is shown. But, although I am by no means certain, I am inclined to think that the court would look to the citizenship of the company stockholders on the one hand and that of the members of the majority of the board, who are charged with fault, on the other, and if so, jurisdiction exists.

"The gravamen of the case consists in the charge that the defendant directors have resolved to, or are about to, put an end to a certain contract made by the Everitt-Metzger-Flanders Company with the Stude-baker Automobile Company on or about August 5, 1908, for the constituting of the latter as a selling agent of the former on a stipulated commission for the disposition of automobiles manufactured by the former company; which contract was subsequently extended so as to include all the automobiles which that company would manufacture.

"For the present it is not necessary to go into the details of this contract. The Stude-

baker Company is not a party to this suitfor reasons which the majority of the board of directors of the Everitt-Metzger-Flanders Company regard as sufficient to require it in the interests of their company, principal of such reasons being that the Studebaker Automobile Company was not prosecuting the business of making sales with due diligence, and was selling other machines conjointly with such sales in a manner which hampers the disposition of the machines manufactured by the Everitt-Metzger-Flanders Company, and they say that they are advised that on account of the non-feasances of the Studebaker Automobile Company of the obligations on its part to be performed the Everitt-Metzger-Flanders Company has the right which it proposes to exercise to call the contract off and refuse to longer treat it as operative.

"It is difficult to see how this court could make a decree such as is prayed for which would not seriously affect the rights of the Studebaker Automobile Company. And in order to make any such decree the Studebaker Company is a necessary party to the suit, and I have very grave doubt whether this court ought, or could, properly render a decree of so much importance to the company without its presence.

"If the final decree in this case should be for the defendant, it must necessarily rest upon the ground that the defendants were justified by the conduct of the Studebaker Company, and that the defendants might lawfully take that position as the basis of their future attitude toward the Studebaker Company, and if that right be conceded the latter company would be cut out of the right to assert its claim, except that it might be able to do so by bringing another suit from which the judgment in this suit would not preclude them. But the rule which requires the presence of all necessary parties rests upon the public policy of settling a single controversy by bringing all parties interested therein before the court.

"The proper mode of determining such a question would, as I think, be in a suit between the two corporations. Such a suit I am advised is now pending in this court brought by the Studebaker Company, for relief against the proposed action of these defending directors. In such a suit the legality of the proposed action of the defendant company can be definitely presented with the proper parties before the court and a conclusive determination of the rights of the parties be made.

"But I do not propose to determine this motion upon the grounds that a necessary party is not here present. For, in my opinion, whether or not the proposed action by the board of directors is justified by the stipulations of their contract and the alleged violations of them by the Studebaker Company, is a question of business addressed to the judgment of the board of directors, and is not one in which the court unless in very special instances—such as when the board, disregarding its duty to

exercise its honest judgment in the affairs of the company, turns aside to a scheme which is fraudulent and injurious to it. In such a case I have no doubt that it would be competent and necessary for a court of equity to interfere and prevent such unlawful action by the board of directors; but in such a case the test must be, not whether the board is committing an error of judgment, but whether it has wilfully deserted its proper functions and perverted its powers by the promotion of schemes mischievous to the corporation.

"In the present case no such condition is shown. Whatever the court might think might be wise and expedient in dealing with the question whether the company should declare the contract no longer of binding force on account of what the other company has done or neglected to do, I should not be justified by any facts appearing so far in this case in finding that there was anything more than error or bad judgment in the course which the board are pursuing. There is at all times a presumption of good faith, and this presumption is enforced by the presumption that a man would not willfully pursue a course harmful to himself; and these directors own a large part of the stock of their corporation. I do not think it can fairly be said that the presumptions are overcome, and must therefore hold that the allegation of fraudulent misconduct on the part of the board of directors is not sustained; that therefore no sufficient ground for the interposition of a court of equity is shown, and that the motion for an injunction pendente lite should be overruled.

"An order conforming to this conclusion may be entered.

"(Signed) H. F. Severens,
"Circuit Judge."

When the case of the Studebaker Automobile Company against the E-M-F Company came up before Judge Swan in the United States District Court in Detroit on December 27, counsel for the Studebaker Company asked for leave to withdraw the application for an injunction against the E-M-F Company. Counsel for the latter company asked for time to consider the matter, and both sides returned to the court room at 2 o'clock p. m., when Judge W. L. Carpenter, for the E-M-F Company, opposed the application, unless the court also estopped the plaintiff from beginning a similar proceeding elsewhere. It was evidently the opinion of counsel for the E-M-F Company that the object of the Studebaker interests was to change the scene of the action. Judge Swan took the matter under advisement until Wednesday morning.

### Another Suit Under Lehman Spark Plug Patent.

J. H. Lehman, of New York, on November 26, 1909, filed an application for an injunction in the United States Circuit Court, Southern District of New York, against C. F. Splitdorf, of this city, for alleged in-

### New Licensed Association Members.

As we go to press we learn that eight automobile manufacturing firms have been admitted to membership in the Association of Licensed Automobile Manufacturers. They are as follows:

Bartholomew Company, Peoria, Ill.
Brush Runabout Company, Detroit,

Mich.

Buckeye Manufacturing Company, Anderson, Ind.

Moline Automobile Company, Moline,

Moon Motor Car Company, St. Louis, Mo.

Regal Motor Car Company, Detroit, Mich.

National Motor Vehicle Company, Indianapolis, Ind.

Nordyke & Marmon Company, Indianapolis, Ind.

fringement of Patent No. 741,684, filed February 6, 1902, and granted October 20, 1903. This suit is similar to the one brought against the A. R. Mosler Company, an application for an injunction against whom was filed September 13, 1909, and the answer to which was filed December 6, 1909.

### Legal Notes.

A contractor and builder of Trenton, N. J., has been fined \$10 for allowing his fourteen year old son to operate a six cylinder car after he had been warned repeatedly by the authorities. The maximum penalty for the offense is a \$500 fine and sixty days in jail.

Secretary of State Rogers, of Connecticut, has decided that the accident in New Britain on November 5, in which Henry Sherman, of that city, received injuries which resulted in his death, was not the fault of the operator, Richard M. Hill, of New Britain, and Hill's license will not be revoked.

Mayor Miller, of Seattle, Wash., has called the attention of the City Council to the fact that the recently adopted city ordinance providing that all automobiles owned by the city should be provided with easily legible signs to that effect, and carrying an appropriation of \$250 for the purchase of the signs, is not being enforced.

Secretary of State Rogers, of Connecticut, has sent out notice that all automobile license tags must be renewed on January 1. The private owners' tags will have white figures on a red background; manufacturers' and dealers' tags, red figures on a white background, and drivers' markers, yellow figures on a black background. All owners turning in their old tags get the new ones without cost.

### Trade Personals.

Fred M. Hoblitt, a pioneer automobile traveling salesman, has been appointed supervisor of Alco agencies by the American Locomotive Company. Mr. Hoblitt, on his last Western trip for the company, estab-

lished new agencies in San Francisco, Seattle, Denver and Minneapolis.

Webb Jay has relinquished his interest in the Premier Motor Car Company of Illinois, and will become a traveling representative of the Premier Motor Manufacturing Company of Indianapolis.

W. E. Stalnaker has assumed the presidency of the Premier Motor Car Company of Illinois, 2329 Michigan avenue, Chicago, handling the Premier and the Badger cars.

H. T. Boulden, representing the sales department of Reliance Motor Truck Company, of Owosso, Mich., is making a Southern trip for the purpose of establishing selling agencies for the Reliance line in Cincinnati, Louisville, Atlanta and Jacksonville, Fla.

W. H. Kirkpatrick, sales manager of the Peerless Motor Car Company, of Cleveland, will sever his connection with the company on January I. Mr. Kirkpatrick, who was connected with the Peerless Company for seven years, has not yet made an announcement as to his future plans.

J. N. Cross, for seventeen years associated with the Bay View (Milwaukee) mills of the Illinois Steel Company, has been appointed superintendent of the punch and press department of the new \$500,000 works of the A. O. Smith Company, manufacturers of pressed steel automobile frames and parts and complete cars, at Milwaukee, Wis.

S. J. Rowe, president of the Rowe Motor Company, of Waynesboro, Pa., has been for the past fifteen months designing self-propelled fire apparatus for the American La France Fire Engine Company, of Elmira, N. Y. Mr. Rowe has resigned his position, to take effect January I, 1910, and will devote his entire time to the business of the Rowe Motor Company.

Unit Coil Company Sue Cadillac.
The Unit Coil Company, of Jersey City,

The Unit Coil Company, of Jersey City, N. J., have brought suit against the Cadillac Motor Car Company, of New York, alleging infringement of patent No. 884,116, dated April 7, 1908, issued to E. Q. Williams and owned by the company. This patent is claimed to broadly cover the multiple unit type of coil. It is stated that patents Nos. 911,141, of February 2, 1909, and 928,204, of July 13, 1909, are also involved, the latter covering what is known as buckproof coils. As stated in our description of the 1910 Cadillac models some months ago, the company are this year using a novel coil system of ignition manufactured by a firm in Dayton, Ohio.

A street railway, operated by steam, has recently been installed between Mansville and New Orleans, La. The matter is of interest from an automobile standpoint, for the reason that a 30 horse power White steam engine and generator constitute the motive power of the vehicles, power plants of this description being fitted to the front of each of the cars.

### GARAGE AND SALESROOM.

### Dealers' Association Notes.

The Buffalo Automobile Trade Association held its annual meeting and election of officers at the rooms of the Buffalo A. C. last week. The following officers were elected: Chas. F. Munroe, president; E. C. Bull, vice president; Ralph E. Brown, treasurer; John J. Gibson, secretary. The election was followed by a banquet at the Peck café.

Seven representatives of San Francisco automobile dealers met on December 17 and issued a formal protest against the proposed increase in freight rates on automobiles shipped from the East.

The Philadelphia Automobile Trade Association has secured a lease on a portion of a new building now being erected at the southwest corner of Broad and Callowhill streets, which is almost in the centre of the automobile district on North Broad street. The premises will be used for clubrooms.

#### Garage Notes.

Long Beach, Cal.—Cook & Shields Auto Company, owners of the Pacific Garage, have taken a three years' lease on the two story, 50x150 feet garage in course of erection on Locust avenue, between First street and Ocean avenue.

San Bernardino, Cal.—R. F. Garner has been awarded a contract for the building of a garage on D street, between Fourth and Fifth streets.

Chicago, III.—The United Motor Company will occupy the entire building at 1507 Michigan avenue. They have taken the agency for the American and Sterling cars.

Chicago, III.—Richard C. Raddatz has obtained a permit to erect a brick garage at 530-32 Jefferson avenue, to cost \$4,000.

Chicago, III .- The Speedwell Motor Car Company have moved to 1407 Michigan avenue. The Speedwell Building, in course of erection at 2411 Michigan avenue, which is to be their permanent quarters, will be ready for occupancy about March 1.

Peoria, III.—Ray O. Becker, general agent for the Northwestern Mutual Life Insurance Company, has bought out the interest of J. F. Thacker in the Thacker-Brereton Company, the concern operating the White garage at 314 Fulton street.

Muscatine, la.—The Jackson Motor Company have erected a 60x112 feet, one story concrete garage on the corner of Iowa avenue and Fourth street, at a cost of \$5,000.

North Adams, Mass.—The Tower Motor Car Company have opened a salesroom and garage in the rear of the Hoosac Valley Savings Bank Block.

Minneapolis, Minn.—The Hughes Motor Car Company will erect a garage and charging station at Harmon place next

Minneapolis. Minn.-M. L. Hughes, of the newly organized Hughes Motor Car Company, has selected a site on Harmon place for the erection of a 165x66 foot garage and salesroom to handle the Rauch & Lang electrics. The estimated cost is upward of \$20,000.

Minneapolis, Minn.—The Parker Garage Company have asked permission of the fire department to sink a 500 gallon gasoline tank in the rear of their building at Tenth street and Mary place.

Kansas City, Mo .- Virgil Dodge has bought the interest of W. F. Tuttle in the Imperial Motor Car Company, and is now sole owner of the company. Mr. Dodge handles the Woods electric car.

Glendive, Mont.—The Velie Motor Car Company are erecting a 50x160 foot, two story and basement garage at Thirty-third and Main streets, which will be ready for occupancy by January 15. The company have acquired the adjacent property for additional buildings as occasion demands.

Holdredge, Neb .- The Velie Automobile Company will open a garage the first of the month. P. C. Anderson, of Omaha, will be in charge of the business.

Manchester, N. H .- The Red Arrow Garage, a new 150x45 foot brick structure, at 73-77 Lowell street, was opened for business last week.

Attica, N. Y .- Fred M. Broadbooks has several options on building sites on which to erect a garage, to be ready for the spring business.

Bryan, Ohio.-C. R. Bowersox has disposed of his interest in the Christman Garage Company to Philip Christman, Jr. Mr. Bowersox retains his agency business.

Columbus, Ohio.-At Norwalk, Ohio, the C. F. Jackson Company has purchased a site opposite the Avalon Hotel, on which will be erected a two story, fireproof garage, 60x80 feet. The structure will be of brick and steel, with concrete floors.

Philadelphia, Pa .- The Western Garage, at 220-222 South Fortieth street, has been sold to D. Webster Bell for \$25,000.

Chattanooga, Tenn.—The Chattanooga Automobile Company have added a sales and show room to their garage, besides space for the accommodation of ten additional automobiles.

Memphis, Tenn.—The Memphis Automobile Company will erect a 150x75 foot garage on the corner of Fourth and Monroe avenue, the first of the year.

Houston, Tex.—H. T. D. Wilson has made application to the City Council for permission to remodel the Bijou Theatre property into a garage.

Midland, Tex.—George D. Elliott and C. S. Reeves opened a garage on North Abilene street, near the depot. They will do business under the name of the Western Auto and Supply Company, and will carry a full line of supplies.

San Antonio, Tex.—A new two story and basement concrete fireproof garage, with a floor space of 23,220 square feet, has been completed on East Crockett street.

Salt Lake City, Utah.-A. H. Walsh has obtained a permit to build a garage in the rear of 1120 Second avenue.

Rutland, Vt.-W. C. Landon & Co. are remodeling the old laundry building on Evelyn street into a garage.

Janesville, Wis.-Baack, Reed & Gage Company is the name of a new concern which has leased the garage under construction for Wilson Lane, and will take occupancy about February I. J. E. Reed comes to Janesville from Madison, Wis., to take charge of the garage. The lines to be handled have not yet been announced.

Milwaukee, Wis .- The Hickman-Lanson-Diener Company's garage, at 222-6 Third street, was damaged by fire to the extent of \$2,000.

Wis.-The Bates-Oden-Milwaukee. brett Auto Company, 503-507 Broadway, Milwaukee, Wis., has purchased the entire interests of the George W. Browne Motor Car Company, Wisconsin street, Milwaukee. The Marion and Overland, carried by the Browne Company, are transferred to the Bates concern, which handles the Winton and up to now has had charge of the Buick George W. Browne will have charge of the wholesale business of the Bates Company, and Charles R. Johnson continues as city sales manager.

New Agencies.
CHICAGO, ILL.—The United Motor Co., 1997

Michigan avenue, American, CHICAGO, ILL.—B. C. Hamilton, 1218 Michigan avenue, Chadwick and Pullman.

SOUTH BEND, IND.—R. Z. Snell, 517 Michigan avenue, E-M-F "30."

MUSCATINE, IA.—The Heitz Machine Co.

Velie.

MINNEAPOLIS, MINN.—The Hughes Motor Car Co., Rauch & Lang electrics.

MINNEAPOLIS, MINN. - The Pagel-Allen Co., 1417 Hennepin avenue, Demotcar.

KANSAS CITY, MO.—Interstate Motor Co.,

2506 Grand avenue, Broc.

CANDO, N. DAK.—The Cando Auto and Thresher Co., Mitchell, De Tamble. KENMARE, N. DAK.-J. A. Englund, S. &

LAKOTA, N. DAK.-Interstate Motor Car Co.,

MEMPHIS, TENN.-Merriman Brothers Auto

Co., Third street and Washington avenue, Rapid. DALLAS, TEX .- The John Deere Plow Co., Elm street, Jackson.

HOUSTON, TEX.-The Auto & Motor Boat Co., Franklin.

SAN ANTONIO, TEX.—Birdsong & Potcher nick. Maxwell.

SALT LAKE CITY, UTAH.—The Consolidated Wagon and Machine Co., Overland.

BARABOO, WIS.—Protheroe & McHinnis Antomobile Co., Buick.

SUPERIOR, WIS .- The Ross Motor Car Co. Studebaker-Flanders and E-M-F.

### NOTES OF THE INDUSTRY AND THE SPORT.

#### Miscellaneous Notes.

The Wisconsin agency for the Zig Zag tire chain has been established at 500 Enterprise Building, Milwaukee.

The Warner Pole and Top Company, Cincinnati, Ohio, will move to their new quarters, where they will have greatly increased manufacturing facilities, about January 1.

The Twin City Taxicab Company, recently organized in Minneapolis, Minn., have placed an order for 85 cabs, 10 pleasure cars and two trucks with the American Locombtive Company.

The main building of the new Fiat automobile plant in Poughkeepsie, N. Y., measuring 275x375 feet, is now under roof, and the installation of machinery will begin about January 15.

The Kero-Car Motor Company is being organized in Dayton, Ohio, to manufacture an automobile propelled by a kerosene engine. The car can be operated on either gasoline, alcohol or kerosene, however.

The Mound City Buggy Company of St. Louis have decided to handle automobiles in connection with their horse drawn vehicles. Joseph A. Schlecht will look after the automobile branch of the company.

The Tanberg Auto Company, of Eau Claire, Wis., write to inform us that they are not handling the Overland line, as erroneously stated in our December 15 issue under New Agencies, but have taken on the Oakland.

We are informed that the Saurer trucks, which, as reported in our issue of December 15, won all four of the events in the French commercial vehicle trials in which they were entered, were all equipped with Eisemann magnetos.

The Buick Motor Company have begun the manufacture of double cylinder opposed delivery wagons in their plant at Jackson, Mich. The cars have a wheel base of 92 inches, a double chain drive and a carrying capacity of one ton. C. N. Wilt is factory superintendent and Stewart Schram business manager of the plant.

The Stewart & Clark Manufacturing Company, makers of Stewart speedometers, are opening branch offices on the Pacific Coast, one in San Francisco and one in Los Angeles, which will be in charge of Mr. Pelton, formerly sales manager of the Auto Vehicle Company of Los Angeles. The Stewart & Clark business on the Pacific Coast was formerly handled through Hughson & Merton.

The chauffeurs of St. Joseph, Mo., met at the premises of the St. Joseph Automobile and Supply Company on December 18 and formed an organization, to be known as the St. Joseph Chauffeurs' and Machinists' Association. Dallas McFall was made temporary chairman and Leland Scott temporary secretary. It is planned to have an

ordinance introduced in the City Council requiring all automobile drivers to pass an examination and take out licenses.

C. L. Kimball, Chicago, Ill., has acquired 300 feet on the southwest corner of Thirtyninth street on which will be erected an automobile factory.

The Wilcox Engineering Company, Saginaw, Mich., are erecting a new plant on Holland avenue, which will double their present capacity for the manufacture of automobile parts, etc.

We are informed that the Auburn Automobile Company, of Auburn, Ind., has made an increase in capital stock from \$25,000 to \$75,000. Charles Ekhart is president of the company.

The Pope Manufacturing Company, of Hartford, Conn., have declared a quarterly dividend of 1½ per cent. on their preferred stock, payable on January 31, to stockholders of record on January 21.

F. G. Miller and brother, garage managers at Defiance, Ohio, are building a number of cars, which will be placed on the market soon. It will be a gasoline touring car, but further announcement has not been made.

The Russel Wheel and Foundry Company, of Detroit, Mich., have purchased the A. P. Wagner Tool Works, which they will remodel for the manufacture of automobile parts. The building measures 150x200 feet.

The Sears & Scoville Company, Cincinnati, Ohio, are planning the erection of a four story concrete building as an addition to their plant in Brighton, to enable them to manufacture motor trucks on a larger scale.

A stock company is being organized by business men at Seymour, Wis., to manufacture trucks and pleasure cars. The property of the Dean Manufacturing Company has been leased, and the machine shops and foundry will be overhauled at once.

A number of the rubber and tire factories of Akron, Ohio, are preparing to participate in the All-American Exposition to be held in Berlin, Germany, August of next year. Secretary Stevens, of the Chamber of Commerce of that city, is looking after the matter.

The Parry Automobile Company of Indianapolis has closed a contract for 2,000 automobile bodies with the Roach-Brown Manufacturing Company, of Cumberland. They are to be delivered as fast as they can be finished. The Parry Automobile Company states it will manufacture 5,000 cars for the 1910 season.

Sears, Roebuck & Co., Chicago, Ill., have leased from the Grand Central Market Company a large building at the corner of Loomis and Harrison streets, erected two years ago for market purposes. The Sears-Roebuck firm will use the building for manufacturing automobiles. The dimen-

sions are 140x476 feet, and the lease runs for a number of years at an annual rental of \$14,000.

#### Club Notes.

Charles Y. Knight, inventor of the Silent Knight sliding valve engine, was to be the guest of honor at a luncheon given by the Chicago Motor Club on Tuesday.

The annual show of the A. C. of Maryland will be opened in the new Fifth Regiment Armory, Baltimore, on February 22, and continue during the remainder of that week.

The Quaker City Motor Club will hold its annual banquet at the Hotel Walton, Philadelphia, on January 6, at which a number of high State and city officials will be present.

Plans are on foot for the organization of a North Texas A C., to include motorists from Fort Worth and Dallas. If the plan goes through a country clubhouse and garage will probably be established at Dalworth, midway between the two cities.

The Chicago Motor Club has gathered statistics concerning the sales of cars in that city during the past year. It was found that eighty-nine different makes of automobiles are represented by eighty-four agencies and branches, and it is estimated that, including the contiguous territory, about 10,000 cars were sold.

At a recent meeting of the Chattanooga (Tenn.) A. C. plans were considered for the erection of signboards and the installation of telephone boxes at crossroads. Members of the club are to be provided with keys to the telephone boxes. For what purpose these telephones are to be used is not stated. Joseph H. Bucholz was appointed a committee of one to work the matter out.

The A. C. of Buffalo held its annual meeting on December 21, at which the following officers were elected: Laurens Enos, president; Harry Thorp Vars, vice president; Donald Mackay, treasurer, and Dai H. Lewis, secretary. The club now has 1,806 members, an addition of 632 during the year. A resolution was unanimously adopted, requesting that a brick pavement, 20 feet wide, be laid in the Williamsville road, between Buffalo and Williamsville, instead of the 16 foot pavement proposed by the State Highway Commission.

### New Incorporations.

The Sumter Motor Car Company, Sumter, S. C.—Capital stock, \$10,000.

The United States Auto Company, Cleveland, Ohio.—Capital stock, \$5,000. Incorporators, Elmer E. Robbins and others.

The Johnstown Motor Company, Johnstown, N. Y.—Capital stock, \$15,000. Incorporators, Chas. A. Miller, G. Hillabrandt,

Henry Veghte, D. A. Hays, E. L. Lucas, Jas. D. Pierson and Fred L. Carroll.

Chalmers-Hipple Company, Philadelphia, Pa.—Capital stock, \$50,000. Incorporators, Geo. G. Hipple, F. C. Vaughn and others.

The Mason Automobile Company, Waterloo. Ia. (formerly of Des Moines).—Capital stock increased from \$250,000 to \$1,000,000.

The Glidden Motor and Supply Company, Brooklyn, N. Y.-Capital stock, \$10,000. Incorporators. William W. Southworth and others.

Broadway Automobile Company, Oklahoma City, Okla.—Capital stock, \$25,000. Incorporators, C. B. Pope, C. W. Talbot and Ray Colcord.

Shafer-Goode Motor Company, Los Angeles, Cal.-Capital stock, \$40,000. Incorporators, Wm. B. Goode, Wm. A. Shafer and Alfred L. Sohm.

The White Garage Company, Oklahoma City, Okla.—Capital stock, \$25,000. Incorporators, J. E. Crawford, L. C. Towler and H. A. Mason.

Commercial Motor Company, Denver, Col.—Capital stock, \$25,000. Incorporators, H. T. Hill, Samuel Norman and P. R. Harfler.

The Memphis Automobile Company, Memphis, Tenn.—Capital stock, \$70,000. Incorporators, S. T. Carnes, N. C. Perkins, J. W. Falls, A. H. Dorsey and William H. Gates.

Kokomo Motorcycle Company, Kokomo, Ind.—Capital stock, \$100,000. Incorporators, W. H. Gilman, J. D. Kennedy, L. C. Woodhill, G. W. Charles and E. A. Mc-Guire

The Dothan Auto and Garage Company, Dathan, Ala.—Capital stock, \$10,000. Incorporators, A. J. Smith, Rouse Smith and E. A. Smith, of Tallassee.

The Olds Oaklane Company, Philadelphia, Pa.—Capital stock, \$25,000. Incorporators, C. W. Odell and others. To deal in automobiles and aeroplanes.

Loop Garage Company, Chicago, Ill.-Capital stock, \$2,500. Incorporators, J. J. Downey, J. H. McGay and John E. Spriggs.

The Hughes Motor Car Company, Minneapolis, Minn.-Capital stock, \$50,000. Incorporators, M. L. Hughes and others.

### Columbus, Ohio, Automobile Show.

The first automobile show held in Columbus. Ohio, opened in a blaze of lights, and with much ceremony at 8 o'clock Christmas evening, when Governor Judson Harmon turned the electric switch which opened the show. The Columbus Automobile Club, a large and flourishing organization of Columbus motorists, is behind the show, which is being held in the Columbus Auditorium, one of the largest halls in the Middle West. The entire interior of the hall is covered with white bunting, trimmed with red. Artificial palms, orchids and other plants are placed at frequent intervals, and they are surmounted with myriads of variously colored electric lights, which give the effect of natural flowers. Opposite the entrance is a huge automobile wheel fashioned out of electric lights.

A total of 134 motor cars are exhibited by several score of dealers and agents. Practically all the cars represented in Columbus and central Ohio are on exhibition. All the cars are of 1010 model, fresh from the factories. Many new features are displayed, and interest in every direction is at a high point. One of the features of the decorations is a large number of canary birds. which have been secreted in the tops of the artificial shrubbery. When the lights were turned on the birds began to sing. This feature is one of the many novelties of the Columbus motor show. The attendance the first night was all that could be desired, and society turned out in full force. The exhibition will continue for one week. One of the novelties planned for New Year's eve is the placing of reeds on the horns and in that manner usher in the New Year.

### Eddie Bald Rejoins Columbia.

Eddie "Cannon" Bald is back to his first love, behind the wheel of a Columbia motor car again. The Columbia was Eddie's first motor love, just as the Columbia bicycle was Eddie's mount in the days when he was the international cycling champion. When Bald first became associated with motoring he sat in racers built for him in the Columbia factory at Hartford, Conn., following an apprenticeship in the Columbia factory. Bald's track generalship won him many events, and he also drove in one of the record breaking Columbia dashes from Chicago to New York. Bald is now associated with the agency for Columbia cars in Pittsburg, which city is now his home.

#### Indianapolis Dealers Elect.

The Indianapolis Automobile Trade Association last week, at one of the daily poon luncheons of the "Flat Tire Club," a social organization composed in part of the members of the former, took the first steps toward preparing for the annual Indianapolis Automobile Show by the election of new officers to pilot its fortunes. The election resulted as follows: President, Fred I. Willis, of the Hearsey-Willis Company; treasurer, Frank L. Moore, of the Fisher Automobile Company; secretary, Frank B. Willis, of the Willis-Holcomb Company.

### Patents Issued October 12, 1909.

936,284. Friction Clutch Electric Control.— Harry M. Abernethy, Cleveland, Ohio. Filed April 3, 1909.

936,291. Gearing.-John W. Belyeu, Alexander City, Ala. Filed November 10, 1908. 936,300. Speed Changing Mechanism.—Fred-

erick C. Brunhouse, Philadelphia, Pa. Filed January 13, 1909.

Lifting Jack .- John E. Crowle, Bal-016.100. larat, Victoria, Australia. Filed September 9,

936,338. Power Transmission Mechanism.-Benjamin F. Mayo, Salem, Mass. Filed December 9, 1905.

Roller Bearing .- Henry V. Smith, Bridgeport, Conn., assignor of one-half to Eugene H. H. Smith, Bridgeport, Conn. Filed January 11, 1909.

936,513. Vehicle Seat.-Judson Benson, Ames bury, Mass. Filed December 12, 1908.

936,530. Permanent Magnetic Metal.--Samuel Gertler, New York, N. Y., assignor to Charles F. Splitdorf, New York, N. Y. Filed March 9.

Automobile.—Bernard A. Alnevin 936.505. New York, N. Y. Filed March 13, 190

Electrical Coil,-Maurice C. Rypinski, 936,669. Pittsburg, Pa., assignor, by mesne assignments to Westinghouse Electric and Manufacturing Co. East Pittsburg, Pa., a corporation of Pennsylvania. Filed November 18, 1907.

p36,692. Commutator Brush.—Vincent G. Apple, Dayton, Ohio. Filed July 7, 1906.
936,694. Reversing Mechanism.—Frederick J. Ball, New York, N. Y., assignor to New York Gear Works, Brooklyn, N. Y., a copartnership. Filed January 31, 1908.

936,750. Supplemental Wheel for Motor Cars. -Arthur E. Whitney, Winchester, Mass. Filed June 22, 1908.

FOSTER SHOCK ABSORBER 1413 East 40th Street, Cleveland, Ohio

### Die-Cast Bearings and Bushings for Automobiles

Franklin bearings and bushings, accurately made by the Franklin Die-Cast Process from a special highgrade babbitt, fit better, wear better and are more economical than the best machine-finished parts. Cast by one operation in steel dies,

they require no filing, turning or grinding. Automobile manufacturers prefer them to phosphor bronze bearings. One trial will demonstrate their value.

We make all kinds of small parts-fully finished, ready for assembling. All holes, lugs, threads, teeth and spurs cast by one operation.

Write for our new booklet A, describing Franklin Die-Castings and the Process; it is interesting.

Franklin Manufacturing Company 201 South Geddes Street Syracuse, New York

## Cheres Real, Honest Value

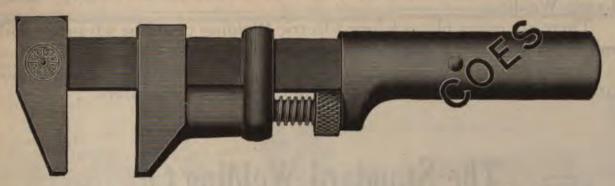

In every Coes Wrench we make, backed up by 70 years of wrench making experience.

Proven by sixteen rigid inspections before leaving our hands. Made of high grade steel, drop-forged, specially hardened. 30% stronger than any other wrench on the market.

The fact that we turn out 960,000 wrenches a year proves we are in the lead.

Perfect wrenches only—no seconds, job or house lots ever made by us.

Coes wrenches will start any nut you can get between the jaws, without injuring it, stripping the thread of the bolt, or breaking a casting.

Do not let dealers persuade you to accept a "Near Coes." No wrench made can equal the Honest Value contained in a Real Coes.

Our new Auto Wrench is the latest and best. Made in two sizes: 6 inches and 12 inches.

Write for Wrench Book.

NEW DEPARTURE MFG. CO., Bristol, Conn.

### GET OUT OF THE MIRE

EQUIP YOUR CAR WITH A PITTSFIELD SYSTEM AND END YOUR IGNITION TROUBLES.

The man who uses a Pittsfield Magneto never gets mired in a mud hole. The strong, efficient spark of his ignition system never fails to properly ignite the mixture. The hot, high tension spark of the Pittsfield Magneto increases the snap of the engine a hundred per cent. and gives the full energy of the motor and the maximum efficiency of the fuel.

If you believe in Magneto Ignition the Pittsfield Magneto cannot fail to meet your approval. No Moving Wires. No complicated Distributors. No Untried Features. Everything that makes for Good Service.

There are other Pittsfield systems.

Don't turn your high powered machine into a "near wagon," and have to be hauled out of your difficulties by the nearest farmer's horse. You can avoid it if you use a Pittsfield system. Any good motor has more than the power you need. It only needs a good spark to ignite the gasoline. Any one of the Pittsfield systems will give that

1910 Model, \$1,500

incre-Detroit "30," co10 Model, has a 115-inch wheel base. That's three inches our "Forty" of last season. It has 34-inch wheels, against 32-inch last season, more roomy and stylish, the hood accordingly longer and higher. This amazing the lines of the costlict cars—showy, roomy, long, luxurious—sells again this .500.

### Indiana Victory A Triumph of Worth

Capture of cup at Crown Point by a Chalmers-Detroit "30"-a victory for the construction, workmanship, mechanism, material—the power, the vitality of this amazing \$1500 car.

On June 18 at Crown Point, Indiana, sig-nal proof of the astounding value in the Chalmers-Detroit "30" was added to the

Chalmers-Detroit "30" was added to the record of 1909.

For Joe Matson's first place in a Chalmers-Detroit "30" in the great race there that day was no chance winning.

A victory for his skill, it was tremendously a triumph for the car. The car that could seize the laurels in that grueling stock car contest had to be a master achievement in mechanism material conachievement in mechanism, material, con-struction, power, speed—above all in sound-ness, ability to withstand punishment. The Chalmers-Detroit "30" won.

### Perfect Car Mechanically

Broken parts, faulty lubrication, a loose connecting rod, a leaky valve—in a word,

A Memo to Chalmers-Detroit Motor Co., Detroit, Mich. Please send catalog to
Name
Address
City
County State
HORSELESS AGE, NEW YORK.

any defect-would have been fatal. A per-fect car mechanically was demanded.

The Chalmers-Detroit "30"—a stock car
—won. It is the same car any man would
get who purchased a Chalmers-Detroit "30"

The Chalmers-Detroit "30" was a new car only a year ago. One could judge it only by the splendid records of the Chal-mers-Detroit "Forty."

Its main prestige lay in the fact that Mr. Coffin designed it—the man who designed our "Forty." But \$1,500 was a new price—an amazing price. And all the world wondered what sort of car it would buy. Now the records are in.

### Records of 1909

One of our "30's" has been run more than 32,000 miles, including the path-finding trip from Denver to Mexico City. Never has any car at any price made an equal endurance record.

Owners have paid us for repair parts on all cars shipped during the year just passed, exactly \$2.44 per car. We believe that's an-other world's record.

In the Economy Test, made in New York by the New York Auto Dealers' As-

sociation, our "30" made 25.7 miles on a gallon of gasoline.

On a long distance road race its average speed was 51.5 miles per hour.

Never did a car prove more satisfactory. Never did a car cost so little for upken. Mr. Coffin has devoted another year to its study. Yet he has found no mechanical way to improve it. way to improve it.

### No Question of Choice

The tide of automobile demand is turning to these medium-priced cars. Not alone because of their moderate cost, but mainly because of their low cost and upkeep.

Most men find in the Chalmers-Detreat "30" all that they want in a car. And so

"30" all that they want in a car. And so price can buy more than we give in our "Forty" save unneeded power.

Last season the cars had no real competition. This season we have doubled their sightliness without adding a penny of cost. We have even reduced the price by adopting the policy of furnishing the catras, at the lowest possible cost—must cheaper than you could buy them, excepting from us.

There can be no question of choice. There is nothing on the market which begins to compare with the value one gets in these cars.

The "30" Limousine

Finished in superfine Waterloo broadcloth, Price \$3,750, including Magneto, Gas Lamps, Tank, Vases, Toilet Case with hand mirror, French plate glass and every other possible refinement.

The "30" Roadster, \$1500

The "Forty" is made in this style, too, at \$2,750.

Chalmers=Detroit Motor Co.

The Chalmers-Detroit "Forty," 1910 Model, has a 122-inch wheel base—ten inches longer than last season. It has 36-inch wheels—two inches larger than last season. Upholstered in hand-buffed leather. Magneto free. You should see this car. With all the costly improvements price still remains \$2,750. Two extra seats, making it a seven-passenger car, cost only \$75.

### Our 1910 Models on Show in July

So the 800 people disappointed in not getting the 1909 models can secure the new cars four or five months before the calendar year begins.

When the people awoke to what an amazing car for the money we had created in the 1909 Chalmers-Detroit "30," we couldn't hope to supply the demand.

In its first season we turned away orders for 800 cars of this model—representing \$1,200,000.

Now we announce our 1910 models, on show in July.

Deliveries will begin about August 1st. Get your order in now with your dealer.

For, although we have increased our output for 1910 by 1,000 cars, last year's record indicates we will still be unable to

### Larger Cars-Same Price

In 1910 we give you even more for the money than before.

Our new Chalmers-Detroit "30"—our \$1,500 car—will have a 115-inch wheel base. That's three inches longer than our 1909 "Forty." It will have 34-inch wheels—two inches larger than last season. The hood will be three inches longer and two inches

higher—in keeping with the larger body. The tonneau will be large and roomy. And not a car on the market, regardless of price, will have a more stylish body.

Our 1910 "Forty" will have a 122-inch wheel base—ten inches longer than last season. It will have 36-inch wheels. Our new "Forty" will be upholstered in hand-buffed leather, and a Bosch Magneto will be furnished free.

Yet, with all these costly improvements, not a penny is added to the price of either car. Two extra seats in the "Forty" Tonneau, making it a seven-passenger car, will cost only \$75.

### Profit Still Nine Per Cent.

Our profit for 1909 was approximately 9 per cent. For 1910 we figure it will be about the same. Cost of materials has advanced \$75 to \$100 per car. Yet we have more than offset this by increasing our capacity by 1,000 cars.

These 1,000 additional cars will be produced without a dollar's extra cost for man-

agement, advertising or overhead expense. Our fixed expense last year was divided by 3,000 cars. This year it is divided by 4,000 cars.

Then, our cars of last season were mechanically perfect—so are not altered mechanically. Therefore, the same tools and machinery serve for another year.

#### Saving Goes Into the Cars.

Every penny we save in these ways goes to increase the beauty of the cars.

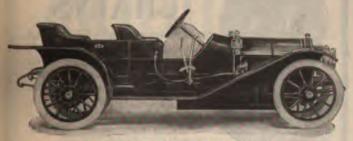

to increase the beauty of the cars.

The saving is all spent for size and style and room.

Chalmers-Detroit cars will always give all the value possible to give and retain what would be a fair profit in any business. For 1909 the utmost worth was given. For 1910 a beauty of line beyond compare is added.

Look at the lines of the 1910 models. There are no handsomer cars at any price.

Send now for our new catalog showing the 1910 improvements. Then let our nearest agent show you the cars themselves.

"Forty" Pony Tonneau, \$2,750

Same style in the "30" also, at \$1,500.

is made in six different grades, one of which is made for your particular car. It saves you expense and experiment. It protects your car from friction, the hardest, costliest kind of motor wear.

A valuable booklet on motor Irrbrication will be sent free on application. Lists every automobile made, and shows grade of MOBILOIL necessary for its perfect lubrication. Contains track records up to date, and facts of vital interest to motorists.

MOBILOIL, in barrels and in cans with patent pouring spout, is sold by dealers everywhere. Manufactured by

VACUUM OIL CO., Rochester, N. Y.

### DOOLITTLE RIMS

Demountable—Quick Detachable

### You Need Them

because they are the only solution to tire trouble. Everyone to whom we have demonstrated these rims is enthusiastic. Our factory is working night and day to fill the orders we now have.

### THE QUESTION OF SAFETY

We have on exhibition a wheel that was torn off a high power car in collision with a tree. Every spoke of the wheel was entirely whipped out. But the rim with the tire still fully inflated was uninjured.

Come in today and let us show you these rims. At any rate, write for our catalog and other literature. Remember we can equip your car here in a few hours, or any wheelwright can do the trick right in your own city.

### THE DOOLITTLE RIM COMPANY LTD.

1666 Broadway, New York

TORONTO, CAN.

COVENTRY, ENG.

The reason for the unusual success of Franklin automobiles is in the principles on which they are built.

The Franklin engine is air-cooled.

Everywhere automobile owners and prospective buyers are coming to realize the handicap of water-cooling complication over aircooling simplicity.

It is quite natural for an automobile owner when driving to compare the ability of his automobile with that of other automobiles. The results of these comparisons are proving the claims we make for Franklin ability and reliability. On ordinary roads the Franklin will make time equal to that of any automobile. On poor roads it will stand up better and cover more miles in a day than other automobiles. The reason for this is simply in the Franklin being built to conform to all road conditions.

It is easy enough to see that a heavy automobile will not control as readily as a light-weight one.

Franklins are the lightest-weight automobiles made. Their construction permits driving at speed over rough and uneven roads. They are not racked and strained. They are readily controlled.

Continuous and uniform development of power is a requisite to perfect automobile construction. The Franklin with its air-cooled engine will under all conditions develop full power. There is no restriction of ability due to over-heating, as is the case in water-cooled engines, when heavy or hard running is encountered.

Which is the best plan of construction, an automobile free from complication, every feature simplicity itself, or an automobile having complication that not only requires attention but which is liable at the most critical moment to cause trouble?

There is no part of the Franklin that is complicated. Every unit of the automobile is built with a view to simplicity, long and satisfactory service.

The man who buys a Franklin purchases ability and comfort—and that is what you want.

Write for our new catalogue.

N. B.—In the Prince Henry Tour F. & S. Ball Bearings were used on the First 12 Cars (excepting the 7th Car), thus duplicating last year's win on F. & S. Ball Bearings.

## ALL MOTORDOM

has recognized in a most substantial manner the superiority of the . . .

### Stewart Multipolar

PATENTED. OTHER PATENTS PENDING

### Attention of the Trade

We own early patents which all magnetic speedometers now on the market infringe. We will bring suit for an accounting and damage against makers, sellers and users of these infringing instruments. It is not our intention to fight these suits in the trade papers, or to unnecessarily annoy the trade, but we do intend to vigorously prosecute our rights.

We will be pleased to send a full explanation from our patent attorneys covering the case and show wherein our rights are infringed, so that our customers may submit same to their own attorney for advice before continuing the infringement.

There are now in actual use more Stewart Multipolar Speedometers than all other makes combined.

Try the Multipolar for thirty days and learn from your own personal experience why most car owners are reading their speed from these accurate instruments.

The speedometer that always tells your true speed—the Stewart Multipolar. Get one. Most dealers handle Stewart Speedometers exclusively.

### An Unqualified 5-Year Guarantee with every Multipolar

### FOR SALE.

F ASTEST car in the world for sale; 120 h. p. Address A. Hoh, 340 Willoughby ave., Brooklyn, N. Y.

FUR SAIL"—Second hand automobiles and motorcycles of guaranteed conditions. Skaneateles Automobile Agency, Skaneateles, N. Y.

COLUMBIA Electric Victoria: 44 cell Exide battery; cost \$4,000; 1907; will sell for \$1,000. Mrs. Edw. Ellis, 215 Union st., Schenectady, N. Y.

FOR SALE—The best receipt for filling tires; old tires made new; new tires made better. Remit 25 cents in silver to J. L. Lucas, 1 Fox street. Bridgeport, Conn.

O NE 1907 six cylinder Franklin; thoroughly overhauled, repainted and in perfect order; top and other extras; guaranteed as represented; price, \$1,650 f. o. b. Reading. D. B. Koller, Reading, Pa.

EISEMANN magnetos for sale cheap; we have five four cylinder Eisemann magnetos and two six cylinder magnetos in perfect condition, which we will dispose of at an exceptionally low figure if taken at once. Address Box 25, care Horseless Age.

BARGAINS— CARS OF ALL MAKES AND TYPES FOR SALE.
WE BUY CARS AND PAY FULL VALUE.
20TH CENTURY AUTOMOBILE CO.,
1615-17 Broadway, cor. 49th St. Tel. 4767 Col.

POR SALE—Independent or Pioneer casings and tubes; new, 28x3, \$12.50, tubes \$3; 30x3, \$17.50, tubes \$3.25; 30x3½, \$17.50, tubes \$3.75; 32x3½, \$18.50, tubes \$3.85; single tube tires, 26x2½, \$9; 28x2½, \$10; 28x3, \$12; 30x3, \$13. Vulcanizing done well; prices reasonable. Bicycle tires, \$2.25 per pair. Chas. E. Miller, Anderson, Ind.

FRANKLIN 1908 Model G touring car, with top, lamps, generator, tools, extra tires and tubes; also rumble seat to take place of detachable tonneau; guaranteed to be in first class condition throughout; just overhauled, and now in paint shop; nearest cash offer to \$1,000, or trade for larger Franklin 1909 model, and pay difference.

J. M. MEYERS, West Chester, Pa.

OPERATION, CARE AND REPAIR OF AUTOMOBILES—Edited by Albert L. Clough.
A practical, complete and accurate handbook tor
the owner, mechanic and chauffeur; fully indexed.
Will help you out of trouble anywhere at any
time. Sent by mail to any address for ft.ro.
The Horseless Age, 9-11 Murray st., New York.

To get cash quickly will sacrifice 1907 Thomas Flyer, seven passenger touring car, New York to Paris Model, 60 h. p.; absolutely perfect condition throughout; has top, glass front, trunk rack, slip covers, large Prest-O-Lite tank, Warner speedometer, Gabriel horn, clock, two extra shoes, two tire covers, tube case; finish automobile red, upholstering red. P. O. Box 356, Reading, Pa.

#### TIRES. 1908 CLEAN UP. NEW GOODS.

Purchased during money stringency; made for guaranteed stock. Will sell as follows:

28x2½, \$10; 30x3½, \$16; 30x4, \$19.

28x3, \$14; 23x3½, \$20; 32x4, \$21.

30x3, \$15; 34x4½, \$26; 34x4, \$22.50.

Write for particulars on batteries, colls and other sizes of cases and tubes. CHICAGO VULCAN-IZING CO., 1461 Michigan ave., Chicago, Ill.

### SECOND-HAND CARS

Not the usual kind as sold by many agents and users, but cars thoroughly overhauled and guaranteed to be right by a responsible house. Send for illustrated catalogue.

NYBERG AUTOMOBILE CO. 2431 Michigan Avenue, Chicago, III.

### ANOTHER CLEARANCE SALE

Many took advantage of our last sale, and procured unprecedented bargains. Here is another opportunity; lack of storing facilities compels us to dispose of every slightly used and second hand car in stock, including Thomas Flyers, Pierce Arrows, Thomas Detroits Forty touring car and roadster, six cylinder Ford, four cylinder Rambler and many others; remember Riley's advice on procrastination. E. R. Thomas Motor Company, Department S. H., 1200 Niagara st., Buffalo, N. Y.

215 and 217 West 48th St. CHICAGO: ST. LOUIS: 1332 and 1334 Michigan Ave.

Corner 18th. and Pine Sts.

### MISCELLANEOUS.

THE first practical automobile was constructed in 1827 by Sir Goldsworthy Gurney, an English inventor; a handsome engraving from special drawings, and suitable for framing, together with full description, will be sent, postpaid, on receipt of \$1; very interesting; send today; agents wanted. Pictorial Publishing Company, Cortland, N. Y., U. S. A.

THE AUTOMOBILE REPAIR GUIDE

New illustrated edition—provides for every emergency that may arise during the use of the car; also contains automobile and motor boat laws; technical terms are carefully avoided; used by over 30,000 owners and chauffeurs. Price, 25 cents postpaid. W. B. Sandison, Publisher, 1267 Broadway, New York.

### "Operation, Care and Repair of Automobiles"

The book that tells the atuomobilist all he needs to know about his machine; tells how to locate troubles, and what to do when trouble comes; will save the car owner many dollars in repair bills each season. Without question the most useful, and the only absolutely reliable book of the kind ever published,

Chapters on Ignition, Carburatton, Lubrication, Tires, Inspection, Care and Use of Cars, Garag-ing, Washing and Shipping of Cars, Repair Sug-gestions and Winter Use of the Automobile. Each chapter a complete treatise on the subject, and any one of the eight worth alone the price of the book. Compiled and edited by Albert L. Clough, and published by the oldest automobile paper in the English language. 350 fully illustrated octavo pages, with a comprehensive index. substantially bound in cloth. Sent anywhere by mail, postpaid, for \$1.10.

HORSELESS AGE.

15 Murray St., New York.

### **AUTO-CHEMISTRY**

### IMPORTANT

BINN'S BATTERY ACID. A pure distillate of Sulphuric Acid. 5 pint bottles to carload lots.

LIQUID POTASH. The best cleanser for gears, concrete floors, etc. 5 gallon drum to carload lots.

TRI-SODIUM PHOSPHATE. Half a teaspoonful in the radiator water prevents scale and rust and keeps the whole cooling system clean. Harmless, too. 1 lb, tins to carload lots.

"AAA" TURPENTINE. Most Turpentine is adulterated, "AAA" is not. Used by great rail-roads, art museums, etc. 5 gallons to carload lots

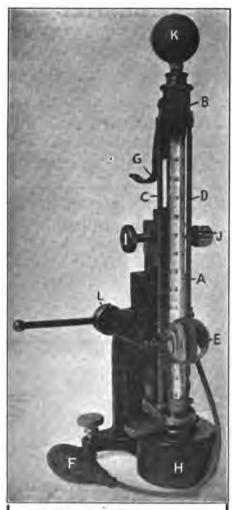

#### RESULTS

We give them. You get We both have them. You get them.

### The Charles E. Sholes Company

Manufacturing Chemists

164 Front Street NEW YORK

### Troubles of Manufacturers

put to an end by the Scleroscope, be-cause with it the hardness of all metals is determined, their strength is calculated, case hardening and tool steels are analyzed for carbon and also toughness and cutting power.

Adopted by leading governments and

manufacturers.

### Nearly everyone knows that

### BROWNELL MOTORS

for 1909 are eminently superior in design, construction, power, economy and in perfection of details.

Power Unit. Model A-6. 6-Cylinder, 20-25 H, P. Automobile Motor,

This complete power unit (in both 4 and 6 cylinders) is unqualifiedly the most desirable proposition on the market for the automobile manufacturer or assembler.

Hence its great popularity.

Our line embraces Motors for a great variety of purposes, in 4, 6 and 8 cylinders, from 14 to 150 H. P.

# Let SHALER Help You Put the Money in the Cash Drawer

### Electric Vulcanizer

Is the very best investment you could make for your garage, primarily because it is a rapid money-maker, and will more than pay for **itself** in one week.

This statement is backed up by the fact over three-fourths of the garages in the United States are making a SHALER ELECTRIC VULCANIZER bring in a large part of their revenue.

It heats in a very few minutes, consuming less than one cent's worth of current per hour. The heat is automatically regulated so that there is no danger of overheating, although it does not have to be watched, and while one tire is being vulcanized another can be prepared.

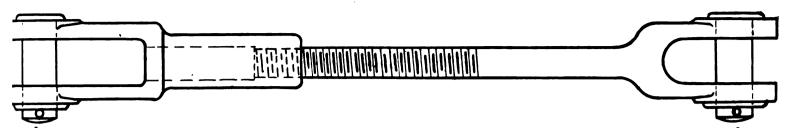

Auto Owners, write for Tire Hand-Book. Write for full description.

#### C. A. SHALER CO.

MANUFACTURERS

Box O, WAUPUN, WIS., U. S. A.

### You Use Rod and Yoke End Assemblies

You use Yoke and Rod end assemblies—and we make them by electrically welding A L A M and other standard forgings to rods of good quality. This is the most satisfactory method of manufacturing these parts both for quality and cheapness of production, quality considered.

Our proposition is to furnish you with these assemblies complete, ready to put into your car with studs, nuts, cotters, washers, adjustable ends, etc., at a cheaper price than your present cost.

Under these conditions will you not let us submit our quotations and prove our statements?

We specialize, too, on other parts—truss rods, connecting rods, propeller shafts, like axles, etc.—both solid and tubular, with forgings welded to the ends.

Send along your 1910 specifications and see what we can do for you.

Heat which recently melted the metal boxes in an automobile owned by Maloney & Kratky, Cairo. Ill., did not injure Non-Burn Asbertos Brake Linino in the least. The flame of a blow torch will not even burn it. If Non-Burn will stand such severe tests, how could heat caused by friction burn it. The intense heat caused by friction when stopping an auto quickly chars and burns leather, cork, camel's hair and other organic linings. And after that their gripping power is gone and they soon go to pieces. Rub your hand over a charred piece of any organic lining and see how smooth it is,—bend it and see how easily it breaks.

Write for sample of Non-Burn and put it to any test you like.

# Do You Belong to the Maxwell" Family?

MAXWELL owners are a contented lot—for theirs is a car to ride in, not to tinker over.

An owner's verdict is the final analysis of the value of an automobile. Since there are 14,600 satisfied MAX-WELL owners it would be an easy matter for you to get an unprejudiced opinion.

The tour of the Maxwell Briscoe Motor Club is an indication of the confidence MAXWELL owners place in their car.

Over 30 MAXWELLS assembled at Columbus Circle on June 14th for a week's tour through the Berkshire Hills of Massachusetts, and over the roads of New York, Connecticut, Pennsylvania and New Jersey—a thousand miles in all.

MAXWELL owners feel the spirit of co-operation extended them by the men who make the MAXWELL.

Why don't you join the MAXWELL Family? Let me send you our catalog and other literature.

Yours very truly,

Benj Briscoe

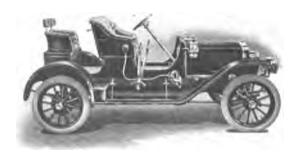

MODEL A-2 CYL, 10 H. P.-\$550.

This standard American runabout costs only \$550. It incorporates all the MAXWELL principles that have made these cars famous the world over. Equipped as per illustration with long fenders and running boards, oil lamps, etc.

MAXWELL JUNIOR, \$500.

Equipped with plain mud guards only, oil lights, etc.

MODEL K. A .- 4 CYL. 30 H. P .- \$1,750.

A gentleman's roadster of "class," equipped with gas lamps, generator and magneto. Same chassis as famous 10,000 mile Non-Stop car.

MODEL D. A.-4 CYL. 30 H. P.-\$1,750.

A powerful five passenger touring car, combining MAXWELL reliability with speed and comfort. Duplicate of the world's record holding, 10,000 mile Non-Stop MAXWELL. Equipped with gas lamps, generator and

MAXWALLS range in price from \$500 to \$1,750. From a 2-cylinder, 10 H. P. runabout to a big 4-cylinder, 30 H. P. touring car or roadster. One of our six models will solve your automobile problem.

### Remy Magneto Under Water for Hours

Required no adjustment. Batteries not needed. Success of this record trip from Coast to Coast largely attributed to perfect results of Remy Magneto.

REMY ELECTRIC COMPANY, Anderson, Indiana:

Gentlemen—Referring to the trip made with the Regal "Plugger" from New York to San Francisco, in which we lowered the touring car record from Coast to Coast, I wish to say that your magneto proved satisfactory in every way; no adjustments of any description were made and no attention paid to it whatever, and yet it never failed to give results.

We used no batteries on the entire trip, starting entirely on the magneto, and although at times the entire engine was submerged in water for hours, we noticed no effect whatever on the magneto, or the result given from the same. We attribute a great deal of our success on this trip to the fact that we had no trouble what ever with your magneto.

Wishing you every success, and trusting that should I again make such a journey I may have a car as good as the Regal "Plugger," and that it will be equipped with a Remy Magneto, I am, Very respectfully yours; (Signed) WILLIAM H. SMITH.

### Over 100,000 Remy Magnetos Sold for 1910

Not a quantity user who helped make our immense 1909 season but that has adopted the Remy for 1910, besides many manufacturers have adopted the Remy for 1910 who formerly used other magnetos. Our factory is the largest and best equipped plant in the world devoted exclusively to magneto manufacturing. Dept. 10,

### The FIRST High Tension Magneto

December 29, 1909.

ever used on a motor was the EISEMANN. Today it still stands FIRST in mechanical construction and reliable operation.

Model Factories, a large staff of Skilled Designers and Engineers always on the lookout for improvements, the Most Expert Workmen in the world, the

Care used in selecting only the Highest Grade Materials and in Supervising Construction, have made the name

### **EISEMANN**

### SYNONYMOUS EX

### **EXCELLENCE**

Their Simplicity and Self-maintenance have won the praise and patronage of the public. Their Scientific Correctness of Construction and their Proven Value as the life-giving factor on automobiles, motor boats, aeroplanes, etc., have won the judgment of the foremost gas engineers. They are in daily use on

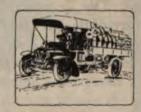

the highest class cars in Europe and America.

### Recent Notable Victories of the EISEMANN MAGNETO

At Indianapolis, Lewis Strang in a Buick, using an EISEMANN MAGNETO, made 100 miles in 92 minutes. C, The Panhard-Tellier, Europe's greatest motor boat, equipped with an EISEMANN

MAGNETO, has for four successive years won the World's Championship. The Dixie II, America's greatest motor boat, equipped with an EISEMANN MAGNETO, holds the World's Record for the Fastest Mile in Competition. C. Count De Lambert in a Wright Aeroplane, using an EISEMANN MAGNETO, made a flight over the city of Paris and around the Eiffel Tower at a height

of 1,300 feet. The flight covered 31 miles in 49 minutes 39 2-5 seconds. In the Commercial Motor Car Competition at Paris, held by the Automobile Club of France, from October 15th to November 15th, 1909, the Saurer Truck, equipped with an EISEMANN MAGNETO, was the only car to win first place in every one of the four classes in which it was entered, thus winning the medals offered by the Minister of Agriculture and the Minister of Public Works.

Write us for further facts about the EISEMANN the magneto with "the spark that never fails."

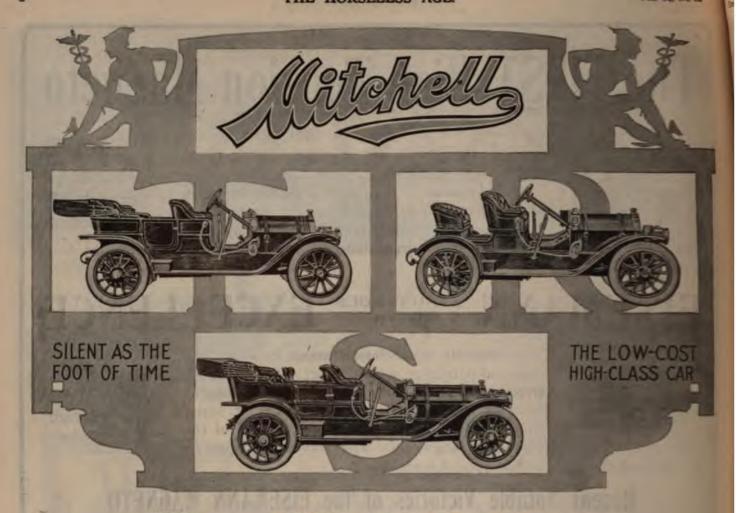

### LAVALETTE & COMPANY

225-227 West 57th St.

New York City

See our Exhibits at the Grand Central Palace Show, Second Balcony, West Side. Madison Square Garden Show, Balcony and Third Tier, 27th St. Side.

### The Mitchell Line

The remarkable construction of these cars—the simplicity of motor, strength of frame, beauty of design and finish, utterly noiseless engine, standardization of parts and attention to those things which are dear to the public heart, as well as the fact that although sold at low cost they are made of the very finest materials the world affords, have all served to create enthusiasm of extraordinary character. Hence the demand is far greater than the supply. The output for 1910—6,000 cars—was sold months ago, and since then we have had orders for so many more that if we could produce 10,000 cars we could sell them by wire in 48 hours.

The entire line will be exhibited at the New York Show beginning at the Grand Central Palace, December 31—Section 6, Space 22, Main Floor.

In writing to advertisers please mention THE Horseless Age.

Economical Enough for the Cheapest Car Efficient Enough for the Most Critical Car Elegant Enough for the Costliest Car

Economical, because the VASCO is a genuine \$50 shield selling for \$35.

Efficient, because the VASCO works on friction discs, without springs, screws or nuts; can be slanted at any angle, with one band, without stopping your car; clears any steering wheel easily; provides a "gap," protecting you in bad weather and at the same time giving you a clear view ahead.

Elegant, because the VASCO has solid brass tubing, finest French plate glass, and de luxe finish throughout.

"The Shield You've Been Wishing and Waiting For"

### "VASCO" BUMPER

This Bumper actually bumps. It affords full protection to the radiator, lamps and front of any car. Handsome solid brass finish, extra long and strong springs. A \$25 bumper for \$15.

#### "Vasco" Grindine Compound

Does away with the old, expensive, injurious method of grinding valves with oil and emery. Put up in cartons containing two tubes, one coarse, one fine; and will grind valves faster, smoother and better than anything else. Small size, 25 cents. Large size, 75

cents, containing five times the amount.

Write for the "VASCO" Catalog to-day and get acquainted with the "VASCO" quality products.

# How Much Lamp Value Do You Get For Every Dollar You Spend?

Solar Omega Headlight

Model 1076—Price, \$10.00 Model 1077—Price, \$11.25 Model 1078—Price, \$15.00 Model 1079—Price, \$18.75 That's a question worthy of your careful consideration.

The price you pay for a lamp represents four things: The material, the workmanship, the overhead expense (including selling expense) and the profit.

The smaller the last two items can be made, the

better the lamp you get.

The overhead expense is practically the same in a plant making 15,000 lamps a year as in one making 250,000.

The profit must be larger in the small plant, in order to give the maker a living.

That is why

### SOLAR LAMPS

made in the largest factory in the country, represent the best lamp value you can buy.

We make every kind of lamp used on the automobile, motorcycle or bicycle. Our overhead expense is so widely distributed that you get twice as much workmanship and material value, dollar for-dollar, as in the ordinary lamp.

That is why Solar Lamps, though they cost a little more than common lamps, are part of the equipment of 80 per cent, of the high-grade cars made in America.

Every motor-car buyer can have them, if he will simply tell the manufacturer plainly that it must be Solar Lamps or none.

Don't let the manufacturer give you lamps that you'll have to throw away later and replace with Solars. Get them at the start and have assurance of absolute safety at night.

Something special coming for the New York Show. Watch for it.

### HERE IS A SPECIAL CAR FOR A FEW SELECT BUYERS

Prices, for either Standard Touring or Torpedo Bodies

\$2500

About three hundred prospective purchasers who have it in mind to pay from four to five thousand dollars can "get in" on this made-to-order Springfield for 1910.

For the past three years a limited number of these cars (about 100 each year) have been made for special buyers, who have desired certain features in their cars not to be found in any cars on the market, regardless of price.

Hence the Springfield has come to be known as the "made-to-order" car.

Until this year no attempt has been made to manufacture more than the few cars, which were easily sold by private sale to the class of buyers to whom a car of this character appeals.

For this reason practically no advertising has ever appeared concerning the Springfield. This year, however, we have increased our facilities, and hope to be able to supply in the neighborhood of three hundred cars.

The fact that we manufacture practically every part that enters into the Springfield makes it impossible (even if we were so inclined) to make them in the quantities possible with an assembled car.

No apology is made for the low price we have placed upon the car. This price enables us to supply the best material of every kind it is possible to buy, and in addition gives us a fair profit.

We are willing to let the specifications speak for the quality of material used and the general character of the car.

The automobile dealer, familiar with all makes, will immediately recognize in these specifications and the accompanying illustrations an automobile of the strict de luxe type—a car of the character that will always have a ready sale among those who are in a position to

### NOTICE TO THE TRADE

Your attention is called to the fact that all rights granted The B. F. Goodrich Company in U. S. Patents 910,869, 926, 296, 894,290. 894,291 and 894,292, covering new and distinctive features of Demountable Rim construction will be fully protected by due legal process against any and all infringements.

We will be glad to demonstrate at our Exhibit in the Grand Central Palace and Madison Square Garden Shows the mechanical advantages of the Goodrich Demountable Rim for ready inflated tires.

### THE B. F. GOODRICH COMPANY, AKRON, O H 10

BRANCHES IN ALL LARGE CITIES

Palmer-Singer Six-Sixty, 6 cylinders, 60 H. P., Sixty-five miles an hour

The 1910 models of the Palmer-Singer line are two years in advance of the new models of other and higher-priced makes and here are the REASONS WHY

#### Features of Construction Common to all Palmer-Singer Models

The best features of the best 1910 cars were found in the 1908 Palmer-Singer models. The five best other makes have between them for 1910 ALL the features which were leading constructional Palmer-Singer points two years ago—but no one make has them all. Still each make very properly exploits these features as the utmost yet achieved in motor car construction and value. Bear in mind that while adopted for the first time in their 1910 models by other makes, these features have been for two years integral points of Palmer-Singer construction, and have been thoroughly tested out for two years in the hands of private owners—have stood exactly the use you would give them. They have been adopted and refined for two years, brought to the point of perfection not only in themselves, but with relation to every other part of the car. Today the harmonious whole is, in design and value, two years ahead of the other leading makes who are adopting these features or a part of them for the first time. Lack of space prevents the enumeration of more than two or three,

#### How Our Cars Are Made

We are now building thousands of cars every year. We are building a few perfect cars for the discriminating men who want perfect cars. The names of our owners are the names of the nation's foremost men. There is prestige in owning a Palmer-Singer. Every individual item of the car's makeup the best that anyone in the world can design, produce or build. Every workman is the best that can be secured for the purpose. If we were building a car to your individual order with the price limit removed, we could do no more in the way of perfect finish, perfect adjustment of each mechanical part. Each car is a masterpiece.

#### The Result

That is why Palmer-Singer cars wear so remarkably welland consistently, one and all give a perfect service, every every week, every season, every year. That is why Palmer-Singer owners say that even the big Palmer-Singer Six-Sixties cost less for repairs or replacements than any other cars they have ever owned. Men have driven our cars for two years without the replacement of a single part, and without a repair beyond the ability of a good chauffeur or an expert owner. Men have given our big Sixes a hard year's use over bad roads in this country and then toured Europe without a spare part with them, having never a hint of trouble except for tire punctures. Not a part needed adjustment, not a spark plug needed replacing, not a skip of the motor, not a knock in any moving

# Prevent skidding absolutely and WON'T cut or hurt your tires—this we guarantee

The Fox Tire Chain prevents skidding absolutely It is the only chain which does. We stand behind this statement fully—it will keep your car from skidding. It will enable you to use your car on days when you would not dare take it out otherwise.

The Fox CAN'T cut your tires. In the Fox, no edge, no cutting surface of any kind comes against the tire. Nothing except a broad, flat, perfectly smooth metal surface, without edges, touches the tire. The broad flat links fit the shoe as harmlessly and as closely as a piece of tire tape. If you should swing a heavy sledge hammer against the links of the Fox Cross Chain, not once, but many times, you could not make it cut into the tires. If you should do this with other chains, you would quickly drive the links into the rubber and cut a great hole perhaps with the very first blow.

### TO THE TRADE

Would you like to have us guarantee to you the sale of 1-2 dozen sets of Fox chains?

Would you like to have us SHARE with you a profit we already have?

Then cut out \*\*\*\*\*\*\* > this coupon and mail to us.

Automobile buyers might be pardoned if they felt a little bit bewildered right now. There are so many new cars being announced and so many radical claims being made for them that buyers are apt to be a little bit "up in the air."

The average automobile buyer is very largely at the mercy of the manufacturer, because he doesn't know nearly as much

about what he is trying to buy as the other man does about

what he is trying to sell.

The average buyer—you may as well admit it—has not had the technical training, nor the experience, that would make him capable of judging whether a new model really was a good one.

He must depend upon someone else. But who? The dealer? He may be prejudiced. The Maker? He may be prejudiced. The record of the car? Yes, by all means, if the car has a record. The public? Yes, again, if the public has bought a car in quantities and tried it.

While the horse may be passing, yet Horse Sense is still as bread and water to us. Here is a bit of it that will appeal especially to any who are bewildered by the many CLAIMS

now being made:

You can't make a mistake if you buy a car of established reputation—a car that has stamped upon it a big, successful, reliable name—a car with a record—a car that the people

You MIGHT make a mistake buying some other kind of a car. A new car may be a good car, but no one knows that it is until it has been thoroughly tried out.

People of the United States have spent millions for motor

reopie of the Onlied States have spent millions for motor cars. Those people really have made purchasing an easy matter for you, when you stop to think of it. Why not profit by their experience?

You take no risk when you buy a Chalmers-Detroit car. Our cars have made good for years. Thousands of owners have proved them for you. Think what they have done to

prove themselves.

In two seasons of motor contests Chalmers-Detroit stock cars have won 89 firsts, 32 seconds and 21 thirds. Motor

Age records give Chalmers-Detroits title of the champion

cars of the year.
You do not want a racing car. Neither do we. We have never built one.

We have not gone into races merely for the fun of it. It is simply a cold dollars and cents proposition. We have gone into contests because we believed that was the best

way to prove our cars.

A man might say he was the best Marathon runner in the world. He might show you that he had a deep chest, and strong legs, and that his wind was good, and give you other reasons for thinking he was a good Marathon runner, but unless he actually went into competition against other Marathon runners and defeated them you would have a right to doubt his claim of being the best.

The same is true of cars. It is easy to claim that a certain car is the best car made, or that it is the best car at the price. It is easy to advance plausible arguments to support such claims, but the one unassailable proof is that of perform-

We spent last year a good many thousands of dollars in automobile contests. One-third of this amount we charged to advertising expense. Two-thirds we charged to Engineering Expense—because this is the best experimental work we know.

We are determined to build the best cars in the world at the price, and so long as we think contests help us do that we shall remain in contest work.

We have never claimed to make the best cars in the worldbut the best cars in the world AT THE PRICE.

True, there are many people who believe Chalmers-Detroit cars are the best cars made, regardless of price—those people are owners of Chalmers-Detroit cars.

And we know ourselves, that Chalmers-Detroit cars are better than a great many that sell for fancy prices.

But the only claim we really want, or need, to establish is that our cars are the best in the world at the prices asked.

	J/L
TYPE	TYPE F OR "GANG"

Tires are higher than ever before. That means that fewer new ones will be bought and that

the old ones will be repaired again and again.

Are you prepared to get your share of this most lucrative business? Are you ready to take care of your customers' tires? If not, someone else is going to get the work and the profits will go into his pocket, not yours.

There is more profit in vulcanizing tires than in any other part of the garage business. You get 50c. for the very smallest job. It costs you less than 3c. The profits on larger jobs are proportional. Can you make money any faster?

We make three types of Shaler Electric Vulcanizers from which you can select an outfit that

will just exactly fill the requirements of your garage.

1. Type B. For inner tube work and for vulcanizing the treads of casings while still on the wheel. The heat is evenly conducted to all parts of the repair, so that there is no danger of

over-curing in one place and under-curing in another.

Type B has a patent handle so that it can be easily moved from one job to another while still hot, and as there is no flame it can be used either in or out-doors, and in any position and on any part of the tire. It has a rheostat heat control, so that there is no danger of the repair overheating or the heat gauge breaking. Cost of operation, one-half cent per hour.

Type B, for direct or alternating current, \$20.00 to \$25.00.

2. Type C will mend any blow-out or tear that it is practicable to mend in any size casing by a much cheaper and simpler method than with the old steam vulcanizer, as the new fabric is applied from the inside of the tire instead of the out, thus saving cutting away a lot of good rubber and requiring only about half as much fabric. This is possible because Type C fits inside of the tire, bringing the heat directly against the new fabric, and because of the enormous pressure that we are able to apply with this vulcanizer to weld the new and old fabric together. You do away with the two weak joints that always occur on a job done by a steam sectional vulcanizer, where the fabric was put on from the outside and which are caused by the necessary lapping of the canvas.

Type C, for alternating current, \$20.00; for direct current, \$25.00.

3. Type E or "Gang," 24 inches long, will vulcanize six tubes at a time or will mend a six inch slit at one setting. It is furnished with four patent clamps and four blocks for four sizes of repairs.

Type E, for alternating current \$25.00; for direct current, \$30.00.

Repairers and Garages, tear our coupon at top of page and mail to us now, together with your letter-head.

# Fundamentally Right For Six Years

The motor in the 1910 Models is exactly the same in principle and all essential features as the motor in the first car built by this company, thus proving that its original designer, A. P. Broomell, started on correct mechanical lines. The record of the Pullman in private service and public tests has induced a close adherence to these "First Principles,"—throughout six years,—though refinements have been made year by year, reaching their climax of perfection in the 1910 Models, which were designed by Guillard, formerly of the Clement-Bayard, Mercedes and the Benz factories of Europe.

The body design and appointments, the control, the braking system, the exclusive oiling system, the semi-elliptic springs, the roomy tonneau, and other vital features all combine to make the Pullman a car of exceptional beauty, easy riding qualities and lasting service.

The newest factory and the oldest builders tell the story in single phrase.

Experience in building is the only left-over factor that has gone into the construction of this car—everything else brand new!

You know the tremendous success of the last car brought out by Byron F. Everitt, William Kelly and William E. Metzger.
This new "Everitt 30," owing to the reasons below given, will surpass in every way all past cars or any new car that can be brought out during 1910.

In writing to advertisers please mention THE HORSELESS AGE.

# SAY I!

THE LITTLE GAR

WITH A BIG HEART

Double Opposed Motor with Offset Cylinders. Bosch Magneto—Schebler Carbureter. Goodyear Clincher Tires—Quick Detachable Wheels, and Full Equipment, all for :: :: ::

\$378 or \$475

ACCORDING TO THE WAY YOU ELECT TO BUY IT

# THE PRICE WINNER

Not only in first cost but also in upkeep. More power and speed at half the cost than others selling at double the price. TESTIMONIALS? PLENTY! Here's what one owner has to say:

"I have been using one of your Metz Plan Cars which I assembled myself in my business for the last three months. It has taken the place of two driving horses, and I am covering more ground than ever before and at considerably less expense than it costs to keep one horse. I have no trouble that I could not remedy myself in a few minutes and have given the car some pretty rough use, and I must say that it is fast enough and an excellent hill climber."

## THE CAR WITH A FAMOUS ENGINE

NY automobile manufacturer with the proper amount of money can buy bodies as good as are used by any of his competitors. He also can buy as good axles, or magnetos, or carburetors, or transmissions, or wheels, or tires.

The market on these items is wide open to any and all manufacturers.

The Pierce Motor Car Company are not unlike 99 per cent. of other car manufacturers in the

The Pierce Motor Car Company are not unlike 39 per cents.

We part company with practically all other manufacturers when it comes to the most essential part of an automobile—the engine.

The PIERCE-RACINE car is not propelled by a stock engine.

When you buy a PIERCE-RACINE you get an engine specially designed by Mr. A. J. Pierce, who has for a quarter of a century enjoyed an international reputation as a builder of high-efficiency engines.

The unusual flexibility, quietness of power of a Pierce engine is the feature that hits the PIERCE-PACINE entirely out of the class of other cars selling at anywhere near its price.

RACINE entirely out of the class of other cars selling at anywhere near its price.

If you were to pay \$4,000 for a car you could not get a more satisfactory motor or an easier running car.

This PIERCE-RACINE at \$1,750 offers the prospective car buyer a value in the most essential feature of his car that is only duplicated by a few manufacturers of high-price American or Foreign cars.

In addition to its superb motor, it has an equipment throughout that is of a thoroughly substantial character.

The hole wheat expires wheletering and accessories—all are of a quality rarely found on a medium-

The body, wheels, springs, upholstering and accessories-all are of a quality rarely found on a mediumprice car.

### NOTE THESE SPECIFICATIONS.

Body: Five Passenger Touring, Baby Tonneau or Roadster. Wheel Base: 112 inches.

# The Brush is not an imitation nor an adaptation of any other automobile

It is not a big, complicated car cut down in size to sell at a low price, but is a simple, staunch, reliable runabout—the only motor car built in this country that can properly be called by that name.

It is designed to do the strenuous work demanded of a runabout, and its design is such that we can build it as well as any of the large cars are built and still sell at this wonderful price. Before the first Brush was built we foresaw the demand for a reliable automobile which would replace the "horse and buggy," just as the big touring car and limousine have replaced the team, the carriage and the coachman.

The enormous demand for the Brush shows that our judgment was correct—and it is not a demand from any one territory, nor from any particular class, but from sane, thinking people in all parts of the world.

# Everybody Buys the BRUSH

THE BUSINESS MAN, who judges it from the standpoint of utility and minimum depreciation-

THE PHYSICIAN, who must have absolute dependability and exacting service.

THE CITY AND COUNTRY SALESMAN, considering initial cost as well as maintenance expense.

THE FARMER, who looks at the Brush as an investment, not a luxury.

THE SUBURBANITE, who is at the mercy of inconvenient transportation facilities.

THE YOUNG FOLKS, who want a good looking little car and must have simplicity without excessive speed. Even the manufacturers of some of the larger automobiles are using the Brush in their business. Could we offer you better evidence of the value of Brush cars than the fact that the Chalmers-Detroit Motor Company is using SIX of them? More than a year ago, these people bought one car, which showed such wonderful results that they have since purchased five more.

The six models we are building, in addition to the standard runabout shown above, will meet the requirements of all. The Brush knows no class recognizes no competition. It is really "Everyman's Car."

Write for preliminary announcement.

### WE ANNOUNCE THE

# KLAXONET

The KLAXONET is to the KLAX-ON what the snappy roadster is to the Cup racer. It embodies all the essential elements of the KLAXON in smaller size and simpler form, and at a price which will appeal to every owner of a small car!

It has the characteristic KLAXON NOTE — the sharp metallic tone that warns.

Its pitch is considerably higher than that of the KLAXON, thereby gaining penetration which largely offsets the smaller volume of sound.

It is wound like the KLAXON, for 6 volts, but it consumes only about one-third as much current. It may be worked with economy and satisfaction on 4 to 6 dry cells.

The motor, like that of the KLAXON, is thoroughly high grade in design and construction. Every detail is as carefully worked out for durability and hard service as in the larger machine.

# THE PRICE IS \$20

Look for the KLAXON and KLAXONET at the New York and Chicago Shows!

Write us for our "Vade Mecum of Ignille"

# 1910 IGNITION

The ignition requirements for the coming year are to be more exacting than ever. The constant adjustment, expensive platinum renewals and frequent breakdowns with which all motorists have borne patiently during past years will not be tolerated for 1910. The vibrator coil, a relic of the earliest days of motoring, will go to join the realm of the rear entrance tonneau and steering tiller.

The real 1910 ignition system—the system which will give the users less trouble than their brakes or clutch—will be the new

# ATWATER KENT Type "B" Unisparker

For the first time we are offering Atwater Kent ignition at a lower price than you have paid for other apparatus not half so good. Nothing has been slighted in the workmanship or material, but a new design, automatic machinery and greatly increased floor space enable us to turn out large quantities. YOU reap the benefit.

Consider what you will obtain by installing a Type "B" Unisparker. You will have an absolutely reliable system; one with only three moving parts, none of them delicate; an apparatus that gives one hot spark for each cylinder explosion, perfectly timed and synchronized. Aself-starting feature obviates cranking. All of these advantages to be gained at less than the cost of a cheap vibrator coil.

Tire Troubles Wiped Out

Motorists in the States can now secure the famous Demountable Detachable Rim which has created such great enthusiasm in Europe and Canada for the last two years. Since its introduction into this country it has proved sure, safe and dependable by the severest kinds of road tests.

### Goodyear Doolittle Demountable Detachable Rims

This Demountable Detachable Rim is simple in principle; it works like fastening on an ice skate with a key, only easier. The Rim is expanded by two bolts, these being worked together by a special double ratchet wrench. These same bolts lock the Demountable Rim to the wheel with a grip of several thousand pounds. The operation is so simple—so easy that you'll never know you are working.

A set consists of five rims. Four of these slide on over steel Felloe Bands, which are applied to the wheels and locked to the wheels as stated above. The fifth contains a spare tire and inner tube already inflated and ready to ride upon.

In case of puncture, blow-out or tire trouble unlock the Goodyear Doolittle Demountable Detachable Rim and off comes the damaged tire, inner tube and rim. It takes less than a minute. ICE, MUD or RUST make no difference—no delay.

Replace these with the ready-pumped-up tire and rim and you're ready to go on. This will take not more than another minute.

Any carriage repairer, wheelwright or blacksmith can equip any automobile with these time, labor and trouble-saving rims in a few hours. You don't have to spoil the wheels. The whole job is very simple. Call at one of our branches for a demonstration of this wonderful Demountable Detachable Rim, or send for complete information to main office.

Wheel Base, 107 in. Tread, 56 in.

P.; wheel base is 122 inches on the seven-passenger, 116 inches on the others; clearance 10 inches on all; Bosch magneto, Stromberg carburetor; wheels 36 inch on the seven-passenger, 34 inch on the others. The high quality and faultless construction of every Selden car produced is guaranteed. We do not build cheap cars. The car shown above is the famous "Torpedo Tonneau."

### Here are some fresh ones just off the bat:

I have been so busy demonstrating my car that I have neglected to advise you what the car is doing. We can do anything that any other car can do, regardless of price or name, on hill climbing or on the level, and we have done things on the hills where other cars of twice the price have failed.

W. L. SIMPSON,
Punxsutawney, Pa.
December 7, 1909.

I have received and tried out to a certain extent the 1910 nodel. I will not criticise it in any point. I will congratulate you. After I have run the car 1,000 miles will give you my opinion of what I consider a remarkably fine car—your 1910 product. F. A. NICKERSON, Portland, Me. December 13, 1909.

We ran your 1910 car from Saratoga Springs to Utica last Sunday over very rough and icy roads in five and one-balf hours, never changing the gear the entire distance, which, as you know, is a very hilly country most of the way; the car is running better every day.

W. L. Gee,
Utica, N. Y.
December 17, 1909.

I made a trip yesterday over very hilly country roads, and the car gave perfect satisfaction in every way. It was remarkable the power it developed. The Torpedo has created quite a sen-

D. 34x3½. WEIGHT—About 2,000 pounds empty.

# ABBOTT MOTOR COMPANY

### **OUR ORGANIZATION**

The Abbott-Detroit is not the creation of inexperienced enthusiasts, but is designed, built and marketed by men who have made enviable records in the automobile world.

Mr. John G. Utz, who designed the Abbott-Detroit, is widely known as the designer of the popular Chalmers "80," and was for about two years Chief Engineer of the Chalmers-Detroit Company. This experience, together with that gained in previous important connections, places him among the foremost few

of American automobile designers.

Mr. John B. Phillips, on whom rests the task of building the Abbott-Detroit, and superintending its production in the large quantities that our advance or-ders already forecast, resigned his position of factory superintendent of the

Chalmers-Detroit Company to take up his present work.

With Mr. A. T. O'Connor, Sales Manager, formerly Assistant Sales Manager of the Packard Motor Car Company, and for a time in charge of their New York branch, will rest the important work of allotting territory to agents and distributing the cars. Mr. O'Connor's experience in the past has taught him the importance of efficient factory organization and rigid adherence to delivery dates.

### **OUR FACTORY**

Every detail has been arranged and every plan perfected to produce this won-derful car at once in the large quantities which the advance demand already indicates will be necessary.

Our new factory building, 155x600 feet, is rapidly nearing completion, and a

large part is now ready for operation without any delay whatever.

It was built by us to fit our peculiar needs, and is fitted throughout with the latest and most modern machinery.

An army of experienced workmen is ready, each man detailed in his work, with his work already systematized for him.

Every detail of organization is completed, so that the cars progress quickly throughout the factory, without hitch or delay.

### IMMEDIATE DELIVERY

This superb organization-men who are acknowledged leaders in the automobile field; perfect factory organization working like clockwork, has a very important meaning to you, Mr. Dealer, and to your customers.

It means that you will get prompt delivery dates on the cars you contract for, and that delivery dates will be adhered to without delay or deviation.

It makes "the car you want, delivered when you want it"-when you can sell it and when your customer wants to use it.

# E.M.F. Company Wins

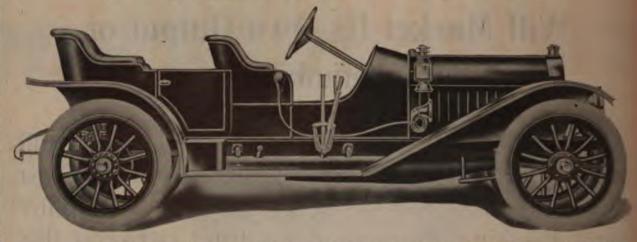

# Will Market Its Own Output of Automobiles

The United States Circuit Court, after a full hearing, refused injunction asked for in the interest of Studebaker's, to restrain the E. M. F. Company from annulling the selling contract between this Company and the Studebakers, and we are now free to contract for the sale of our product direct.

In appointing agents we shall give preference to those dealers who have previously handled the E. M. F. line. That's only fair, for this isn't the dealer's fight, and he should not be made to suffer. We have already signed up with several hundred dealers and for over 5,000 cars. Applications are pouring in upon us from all parts of the country. If you want the agency for E. M. F. "30" and Flanders "20" cars, come to Detroit quickly. Wire us before starting, and we will tell you if your territory is still open.

# E. M. F. COMPANY, DETROIT, MICH.

# Ten Reasons Why You Should Buy An ATLAS CAR

The average automobilist today demands Safety, Comfort, Silence, Style, Power, Fair Speed, Simplicity, Durability and Low Maintenance Charge—and usually a Fair Price. The Atlas combines all of these features to a greater extent than any other car.

I. SAFETY: Every part of the engine and car is made of the best quality material—thoroughly tried and tested under severest conditions. The running brake on the transmission—the emergency brake on the rear hub—construction endorsed by the best designers.

2. COMFORT: Experience has shown that the three-quarter elliptic spring now being generally adopted and first used in this country on the Atlas cars gives the easiest riding car, eliminating all side sway of the platform springs; the springs of the Atlas are extra long three-quarter elliptic, made from imported Krupp silico manganese steel, the best material known for this purpose, which, combined with the long 128" wheel base, gives a car which for comfort has no superior.

3. SILENCE: The absence of external moving parts makes the engine the quietest engine running.

4. STYLE: Atlas cars are classy in lines, are highly finished and handsomely upholstered in hand buffed leather, with every convenience and comfort.

5. POWER: The Atlas 60 H. P. engine is the highest powered engine put into a medium priced car; furthermore, this power is developed at an engine speed of twelve to thirteen hundred revolutions, giving an available power in the hands of the ordinary user for general work and hill climbing.

6. SPEED: The Atlas car has a variable speed from five to sixty miles on the direct drive high speed gear.

7. SIMPLICITY: The Atlas engine is the simplest engine built—two moving parts to each cylinder and a crank shaft.

8. DURABILITY: The Atlas engine will outwear any other automobile engine built—the crank shaft is hardened, ground and polished; the bearings and shaft are indestructible under ordinary conditions, and engine parts replacements are practically unknown.

9. LOW MAINTENANCE: The absence of replacement makes the maintenance cost the lowest.

10. PRICE: The price is several hundred dollars less than any other car of equal power and quality.

60 H.P. Toy Tonneau, \$2500; 60 H.P. Touring Car, \$2500; 20 H.P. Taxicab, \$2400

# The Car That Fits Present Day Demands

# Built to Sell on its Merits at \$1750

The day has come when the public is <u>demanding</u> automobiles of the highest type—of real, lasting merit—at a reasonable price.

Buyers of automobiles today are pretty well informed on car values.

They insist on getting their money's worth in automobiles—the same as in anything else.

With the growth of the industry, it has become more and more difficult to dispose of "near" cars to any but buyers who intentionally buy for one season only.

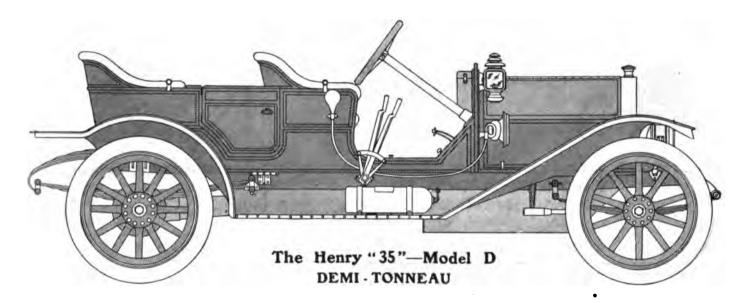

In the past, the automobile dealer has had a good many peculiar contrivances offered to him with the automobile label attached.

In the hurry to make enough cars to go around—and to get a "slice"—some manufacturers with more capital than experience have passed up to the dealer some most extraordinary specimens.

Fortunately for the dealer, there have been heretofore enough kinds of customers to more than take care of all kinds of cars.

## HENRY MOTOR CAR COMPANY

# Real, Lasting Merit At a Reasonable Price

# Built to Sell on its Merits at \$1750

The tendency toward cars of real merits at a reasonable price has been stronger every day, as hundreds of dealers well know.

First, because the generous distribution of automobile literature has educated the public to judge automobile values.

Second, because the buyers of one-year cars invariably buy into a better class on second purchase.

The Henry represents a serious attempt—and a successful one—to give the dealer a car he can sell to this class of informed buyers.

It is built to sell on its merits at a popular price.

The car was designed and is being built under the personal supervision of D. W. Henry, well known to dealers in every part of the country. Mr. Henry has been connected with the automobile industry from the beginning and

## Muskegon, Michigan

has made a careful study of the features that prove most attractive to buyers of moderate priced cars, and these features have been embodied in this Henry "85."

The car has a large motor, a long wheel base, a roomy tonneau, double drop frame, and extra long, resilient rear springs (49 inches) for easy riding.

It is carefully constructed throughout, and the accompanying illustrations plainly show the style is superb.

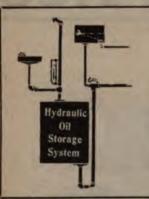

Dealers should investigate the opportunities for them in some choice open terrirories.

### PIERCE-ARROW MOTOR CAR CO.

The National Brake & Clutch Co., Boston, Mass.

Gentlemen: We are very pleased to advise you of the success we have had in the use of leather faced cone clutches and we are free to admit that much of this success is due to the Cork Inserts. These enable the clutch to engage more gently and aid materially in the transmitting of the full power. The leather on the clutch does not readily burn when the clutch is allowed to slip, as most of this slipping is done on the cork, the clutch being then almost disengaged. We will continue to use this type of clutch for 1910 and long after that time unless something is brought out which is much better than anything at present in use for this purpose.

# Good for Running Auto= mobiles, Airships, Shop Tools and Other Machines

where every bit of the power is needed and where absolute dependability is es-

# DIAMOND CHAINS

long ago proved themselves the only reasonable priced drives that could stand the hard knocks of automobile service, they proved their speed and power on winning cars of the most important races, and the Wright Brothers considered them dependable enough to place on the world's greatest flying machines.

Try one Diamond Chain and you will soon discover

that it is the most economical and satisfactory chain you have ever used.

The **rolling** of a chain into mesh saves power over the grinding action of gears, but gives the same positive drive.

In other words a Diamond Chain converts into useful work a large percentage of the power that with other drives tends to wear out vital parts. This alone would make a Diamond Chain drive desirable, but considering that it does its work better, lasts longer, and costs less than gear drive, you can't afford to neglect investigating.

Diamond Chains have been the Standard ever since we originated the chain industry in America twenty years ago. Don't accept a substitute. If your dealer won't furnish Diamond Chains, write to us.

# Diamond Chain & Mfg. Co.

245 W. Georgia Street, Indianapolis, Ind.

Capacity 8,000,000 feet per year.

### 58

# AUTOMOBILE SPRINGS

# Scientifically Tempered

### Heat Treatment

In tempering our Automobile Springs we use specially constructed gas-heated kilns, which can be kept at a uniform temperature of any desired degree and in which the steel bars never come in direct contact with the flame. The steel is also subjected to a series of baths in oil heated to the proper degree.

### Result

The result is that we obtain springs that are full of life and elasticity, yet are so tough and strong that they stand the hardest usage or abuse and can be depended upon in emergencies.

There is no comparison between springs tempered by our Method of Heat Treatment and springs which are merely flashed in oil or chilled with water.

## Steel Used

The steel we use is either Chrome Vanadium, the best steel made for springs, or our Special Analysis Steel, which is far superior to the ordinary carbon steel, which is still being used by some automobile spring makers. Both a physical and chemical test is made before using, and unless it conforms to rigid requirements the steel is rejected.

## Fitting and Tests

All of our Automobile Springs are hand fitted and tested at every step of their manufacture.

## **Deliveries**

We are enabled through increased facilities to promptly execute orders.

STANDARD CONNECTING ROD COMPANY, Beaver Falls, Pa., U.S.A.

# THE McCUE AXLE. Model X

Full floating type axle with annular ball bearings and self-seating thrust ball bearings.

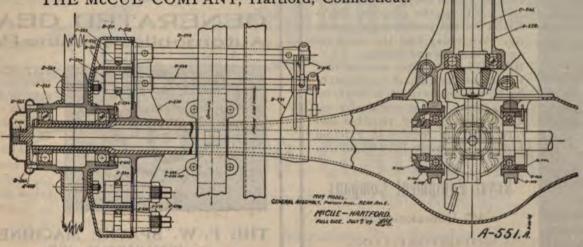

The driving shafts have integral hub clutches—not welded—and are made of .45 carbon steel, heat treated. Two 10 inch and two 14 inch brake drums are operated by four cam shafts connected to equalizers under the body of the car. The brakes are adjusted by the short cam shafts at rear of axle, as shown in line cut.

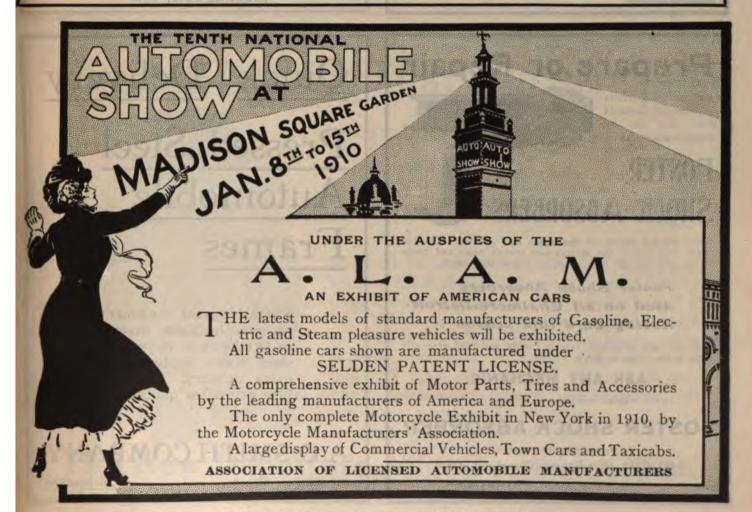

The Hub flanges are accurately machined, also the wheel-bearing surface of the drums making it possible to assemble perfectly true running wheels.

The spring seats are made either to swivel on a bushing or to key permanently to the axle. By removing the hub caps and taking out the floating axles, the gear case with differential and bearings can be quickly removed by taking out twelve bolts.

Torsion rods and torsion rod bolts will be furnished when wanted. This axle is intended for cars of 2,500 pounds weight and under.

THE McCUE COMPANY, Hartford, Connecticut.

Pfanstiehl Electrical Laboratory, North Chicago

# Franklin Die-Cast Bearings

WE are the exclusive makers of Franklin Die-Cast Bearings.

If we can turn out better bearings for you at lower cost than you now pay for machine-finished bearings, won't it pay you to investigate our process?

Franklin Die-Cast Bushings, made of special hard

babbitt, will save you money and time. They wear longer and fit better. They are perfectly

uniform and interchangeable. No filing, turning or grinding. Automobilé manufacturers find them preferable to phosphor bronze bearings.

Write for our new Booklet A, describing Franklin Die-Castings and the Process; it is interesting.

FRANKLIN MANUFACTURING COMPANY

THE GRANT-LEES MACHINE CO., -:- CLEVELAND, OHIO

A. P. Warner in his Curtiss-Herring Aeroplane.

TELLS THE AEROPLANE'S SPEED THE WARNER

### AERO-METER

Here is the First Aeroplane speed indicator. It is operated by four metal cups which revolve under pressure of the wind caused by the speed of the Aeroplane. The speed of the Aeroplane is told in miles per bour by the speed head. The Aero-Meter tells the Aeroplane's speed with the same infallable accuracy that the Auto-Meter indicates the speed of an automobile. The now famous Auto-Meter was the first accurate and reliable speed indicator for automobile use. The Aero-Meter is likewise first in this new field. In fact the Auto-Meter and Aero-Meter are practically the same instrument, the only difference being in the manner in which the latter is driven. Warner speed indicating devices are always first in the field and always best for the purpose.

The Aero-Meter in 1925 A. D.

The Aero-Meter in 1925 A. D.

Fifteen years from today there will be just one infallible, accurate, absolutely dependable measurer of aerial speed—the Warner Aero-Meter—just as today, when unquestioned proof of speed and distance is sought, the Auto-Meter is the only indicator considered.

The Aero-Meter at the Snow The automobile shows will devote considerable space to the Aero-Meter—intly a wonder—and practical—for Mr. Warner himself uses it on his Aeroplane, as shown by the photograph. If you desire full particulars of the Aero-Meter is the Only indicator considered.

Meter, ask for either by addressing Meter, ask for either by addressing Meter, ask for either by addressing

### A car worthy of the name

THE Herreshoff car is designed for those discriminating motorists who want the excellence of the big high powered car without the excessive size and large consequent up-keep and operating expense which the big car entails.

Built of the same material, it has the same grace and beauty of line and finish, the refinement of de-tail which commend the big car, while its size and power are sufficient to do all the work most motorists require.

It is a five passenger, 24 horse-power car, capable of 55 miles an hour or of climbing any hill. It weighs only 1750 pounds.

Its lightness is derived from compact design, sim-

plicity in construction and the use of the strongest materials. The ability to combine lightness and strength comes from an expert knowledge of metals, to be gained only through experience.

HERRESHOFF'S experience in yacht building admirably equips him for this work, while his phenomenal success in motor boat construction proves his exceptional ability to get high efficiency out of his gasoline motors.

No one in America has made so good a record or has won more signal honors with motor boats. He made the most of this experience in the design and construction of this small car of class.

Lightness means economy in operation and up keep. The 1909 Herreshoff cars made a phenomenal record in tire saving. 7000 miles was frequently attained without tire replacement.

Its low gasoline consumption was remarkable; 25 miles on a gallon of gasoline was an ordinary performance. Its oil consumption was also moderate, while other expenses of maintenance and up-keep were wonderfully small.

T saved its initial cost, compared to the big cars, in tires alone, while rendering the same service. Every line of its appearance bespoke its qualitymarked it as distinctively as the high priced foreign cars.

If these qualities appeal to you the 1910 Herreshoff at \$1650 is the car you are seeking. Let us tell you more about it in our complete Catalogue H

Desirable agency arrangements can be made for unassigned territory

When you buy an automobile insist that it be equipped with a

# ODOMET

#### ON ELECTRIC VEHICLES

Each time the batteries are changed, set the trip to zero. Thus you can determine how many miles you are making on each charge of the batteries.

The Veeder Odometer as a regular equipment on any vehicle proves that the maker is absolutely honest in his claims, for should he overrate his battery mileage, his gasoline and oil consumption or the longevity of the various parts, the Veeder Odometer would convict him. You can safely assume that any overrated car will not be equipped with a Veeder.

In addition to the above, the manufacturer who equips with a Veeder enables you to keep track of your regular mileage as well as your tire mileage.

The above cut shows the register of the Form D or dashboard type of odometer. This unquestionably is the most accurate and durable distance recording device ever made.

The following concerns are using Veeder Odometers as a regular equipment on their cars.
